Sex, Lies and Graphics/Video

(but without any sex or many lies)

Jay Does Chicago

Jay Craswell
Contributing Editor

Apparently, many of you think I am insane, while others think I'm funny to read...

As most of you know I don't go to many shows. And when I do go it's usually only because I get "talked" into going by some friends (right, Gribs?). This time, I was sitting on two new products.

Since we were hiding in the Atari booth showing the Leonardo 24-bit card and the Isac/AlberTT card—not to mention the Xyxis r/w optical drive—we really didn't see that much of the rest of the show. But, here, for your approval, is what happened to us.

First of all, I want to thank Bob Brodie and the rest of Atari for letting us mooch some of the Atari space at the last (and I mean the last) minute. Literally the day before he left, Bob got a call from me and took it all in stride. Thanks guys!

Super Mondo Opto Drives

The Xyxis r/w optical disk drive had its first show appearance. (I am using it on the TT030 now.) The drive stores 600 megabytes on a read/write cartridge. You can think of it as a really, *really* massive SyQuest. Cost in quantity of one is $2950. Extra cartridges are, at most, $175.

The drive can be plugged directly into the TT's SCSI port or (on request) we can supply a nifty host adapter so you can use the drive through the DMA port on any ST. (P.S.: We also have units for Amiga, IBM, Macintosh, Sun and, I think, everything else.)

Zigga Colors

Also ready to go for the show were the first couple Leonardo 24-bit cards. This was our "Killer" show stopper. Lexicor will be doing the marketing/sales for us, but here are the gory details.

The Leonardo board gives you 16,7000,000 (16.7 million) colors all at once. There is no need to worry about the palette size, since there is none. Horizontal scan rate is 31.5 KHz (for your VGA) or 15 KHz for the composite "TV" type output. This is switch selectable, by the way. Horizontal resolution is fixed at 512 pixels (like your TV) and is vertical resolution is programmable up to 512 pixels.

This design is a bit different from the AlberTT/Isac and Viking Atari (Moniterm) cards in that I use a big, fat *chip*—with the *chip* being a big, giant part with a gillion pins sold by a *big* company like Texas Instruments.

The idea was that this *chip* would save lots of parts on the card and be reprogrammable. Reprogrammable, in this case, refers to the SYNCs, etc. Well, I think the case for saving me a lot of parts is not so good. I had to add all kinds of junk for the signals that didn't happen to work right with 1MB VRAMs, etc. The programmable features are kind of nice, like the display address start register that lets you do hardware scrolling and the ability to put the Sync signals right where you want to by simply doing an hour and a half of math. It was a big manual!

Graphics Goombas

A few people—TI included—wanted me to use a fancy graphics controller chip. Well to TI I said, "Yeah, OK, tell me that it has fewer bugs than this other part of yours and I'll change."

Well, this brought on a lot of what radio people call "Dead Air." Seems that all of these fancy goombas need a bunch of extra junk to work right. Grrrr.

Besides which, I had already made up my mind to *not* use a graphics co-processor. Here's my rationale for what it's worth. 340xx chips cost big bucks and that's no lie. If you use one of these on a board, you have to expect a big hit at the end user price. And that's just to put it in the board. Secondly, it's my opinion that graphics chips are designed to run great demos—like generating 287.5 thousand pie charts per seconds—nothing more.

Actual programs that make the part look good have to be rewritten to use the functions that that part does well. Because of the work involved and/or the license fee for the special graphics assembler/linker needed to do this, a maximum of one program will ever be written that takes advantage of more than 10% of the part's functions.

And, most important, no part that I know of "fits" into the operating system of a computer (be it DOS, Mac, Amiga or Atari) without man years of work. And no one ever does that, because it's just one part/one board and you could spend your time more $effectively$ doing anything else.

What the Leonardo board does is gives you a simple bitmapped display, accessible to the microprocessor and/or the Blitter (on Megas, STes, etc.). Work is underway to get an honest-to-goodness VDI. And that will make it far easier to get real applications ready for it. Of course, look for Lexicor to move its wonderful goodies to it.

The Men from Lexicor

Speaking of which, I had the chance to work with Lexicor's Paul Dana for the first time. He seems to be a very sharp fellow and was able to whip up a working Targa file viewer before he even got his board! And all on two hours sleep. Thanks, Paul (and to your wife, Alicia, for putting up with the late phone calls).

At the show, I got time to talk with Robert Birmingham, who has been a welcome ear to some of my grumbling and moaning about chips and the Joe Gro Atomic Trash Can Band (both of which I'm sure he couldn't care less about). He showed us his new beta version of Prism Paint, which has some *very* hot features. Also there was Prism Render author David Ramsden (also Mr. Rosetta) who gave some demos of the different programs in the Atari booth on Day 1.

Hotel HELL!

Yup, we stayed at the Ramada (where the show was located) but, unfortunately, we were on the same floor as the "party till you die" crowd. It may have been the Grateful Dead fans? We had two (or was it three?) "fake" fire alarms, plus the added fun of listening to mopeds drive up and down the hallway, running over the room service refuse.

Harry slept through one of the alarms and I half slept through the last one. According to Harry, I woke up during the last alarm and called the switchboard and offered to beat the living crap out of the offenders with a broom handle we had found propping the back door shut when we still thought the "fire" was real.

All in all, it was too much for 3:00 in the morning. Or, let me put it this way—if they had invited us to "Trash this place!!" it might have been a little different. Next time, invite us or else go trash your*self!*

That night did make being pleasant the next day a little tougher for some of us. Fortunately, Harry sleeps like a rock and was quite the salesmen the following day. Me? I was pretty grumpy. Sorry everyone! On that same subject, Atari President Greg Pratt heard all of this and offered to let us bunk in his room if it happened the next night. This is a class act! Thanks.

Amiga Converts?

Well here's where we really get someone in trouble. My dear friend Harry M. got talked into going to the show with me. He's from Chicago and his folks live there. Besides, he knows Greektown and said he

would introduce me to flaming cheese! Let me also say he is a loyal Amiga user. He has an Amiga 1000 and a 3000, and if they come out with a 20,000 he will, no doubt, buy that as well.

He actually liked the Atari equipment and said he wants to get his hands on a TT! Wow!! I am amazed. Next we will hear that the Pope's not Catholic? Just kidding, father!

Bill and Pattie in the Flesh!

No, they weren't in the nude or anything, but I got a chance to meet the fine folks who put out this rag. I proclaimed them *"Bravest People In The World"* for printing my stuff! Or, maybe I am the bravest for mentioning Tom Hoyne by name in my first article. You see, Tom and I have become a legend that will last a lunch time in our close circle of friends.

Because of the outstanding bravery of Bill and Pattie who published that literary masterpiece, it seems we have become *"a reason to write the editor."* Wow, thanks! Apparently, many of you think I am insane, while others think I'm funny to read...good to line the birdcage with and/or read while sitting on the pot. What praise.

Bill commented that the later articles are also getting good response, but not in the same way. We can always venture back and forth in style (as you see).

He did mention some people are looking at my comments about gray scale fonts and someone is actually writing some programs on the Atari 8-bit?! Whew! Way to go, you guys. What I know about the older machines is limited to Star Raiders on the 400. But, it's nice to know that 8-bit owners still have the inventive spirit. I guess you should know that my second Atari, after that 400, was a MegaST4—which Moniterm still has (I guess). More about that in a later article.

Other Showgoers

I got a chance to meet the fine folk at WuzTech for the first time. OK, first I have to say they have a new graphics card (The Norm board, designed by Norm Weinress, who also did the DEKA interface.) It has been a bit of a worry for me, since I've gotten used to being the only graphics guy in town.

Well, a little competition is not *so* bad for a guy. And I have to admit that I really enjoyed my talk with Paul and his assistant. It was nice to meet people in the computer hardware biz and exchange war stories.

I know companies with competing products normally square off and try to bash each other. The solution, of course, is to say "This is mine and that's yours," etc. I've an unwritten agreement with Jim Allen, for instance, that says "You do CPU speed-ups and I will do graphic cards. And let's see if we can make sure they work together." Jim, by the way, is one of the greatest guys. He always seems to have the inside scoop on this or that.

I guess the thing that really *pos* many of us is the flock of *me too* products that are remakes of a similar product but sold at a cut rate price. Honestly, I don't see the point in having so many guys making the same thing (more or less). I really wish there was more original thought and less "same as, only $5 cheaper" products. But, that's just me.

Fortunately, on the graphics front, the cards are quite a bit varied as far as features and price. At COMDEX, the folks at Gribnif told me about a card they were thinking of importing. Crazy Dots? What a name! Well, anyway, they told me this like they expected me to get really angry or something.

To be honest, I was just a little hurt. Hey if you want to sell some graphics cards, you *could* call me. Ok? I've got some pretty good stuff that's been selling well for a quite a while. And, I can't think of people better suited to market a product than the Gribnif gang. They are good! But, to be honest, the specs that I saw for the Crazy Dots board didn't impress me. This was a card I would never want to make. But hey, that's just me, too.

Anyhow, back to WuzTech. I guess I was just surprised they were such good guys and I want to wish them success. (You too Gribbies!) These graphics cards are not really head-to-head with any of my products anyway. So, again, good luck! Unless it's at my expense, *then watch out*! <grin>

Besides, if we start converting Amiga-oids and have sales like we've heard about at the last couple shows, we'd need more places to handle the volume!

Time Savers!

New! LogoLibrary™

FLOWERS for All Occasions

RESTAURANT

LogoLibrary consists of over 1060 images for desktop publishing. Includes over 600 printer's logos for business advertising, stationery, etc. In addition there are 460 symbols and graphics for charts, posters, shirt designs, signs, etc. All images are hi-res 300 dpi graphics in .IMG format for PageStream, Touch-Up, Calamus, Publisher ST. 6 d/s disks & 72 page directory. $39.95.

Qwikforms™ for PageStream™

The key to quick and easy, professional-looking forms and documents is Qwikforms™, the only package of business and personal forms with over 100 different, adjustable layouts. Just choose the one you want, insert your name, logo, or text, and print. Business forms include invoices, inventory control, real estate forms, job estimates, applications, organizers, ledgers, charts, etc. Page layouts include newsletters, letterheads, business cards, brochures, booklets, envelopes, press releases, resumes, etc. Legal forms include wills, deeds, claims, bill of sale, power of attorney, etc. Personal forms include announcements, cards, architectural symbols for home planning, mail lists, invitations, etc. There are also guides and many other unique and unusual uses of PageStream. Includes 2 free disks of PD clip art, symbols and logos, and other useful desktop publishing accessories. State which computer you have. $39.95

Cliptomania™ 10 full d/s disks of hi-res PD clip art in .IMG format for use with PageStream, Publisher ST, Touch-Up, and Calamus. Categories include Advertising, Animals, Cartoons, Fantasy, Holidays, Letters, People, Restaurant, etc. Over 360 images! $39.95

Templicity™ Home and Small Business Spreadsheet Templates for LDW and VIP Users!

Now you can instantly use your spreadsheet to calculate and analyze mortgage rates, do your bookkeeping, calculate your income tax, estimate the maximum affordable price for property, design a savings program for education, count calories, create invoices, etc. This package of 104 prefabricated spreadsheet templates covers everything from accounting and budgets to inventory and real estate. Tax templates are upgraded each year for $5.00. Available in separate versions for LDW Power and VIP Professional. $39.95

A Dealer's View of the Chicago Show

Michael Drysdale

I arrived in Chicago on Sunday just in time to attend Bill Rehbock's seminar. Under Greg Pratt's watchful eyes and ears, Bill was as revealing as possible about a number of things. It is, of course, possible that some of what he discussed will change....

Bill started by pulling the STBook out of its case. He suggested that final production models, available first quarter '92, will use a 16Mhz 68000, with 4 MB RAM and a 40 MB hard drive at a retail price of about $2100. Bill emphasized that the STBook was designed with many power-saving features—many more than other notebooks.

Greg Pratt, head of Atari US

Most importantly, Atari designed the save and resume feature to save an image of RAM to the Hard Drive *before* the batteries wear down. There will be third party opportunities to sell a cartridge port adapter and a multi I/O MIDI port for the STBook.

PLI, a company specializing in mass storage devices (CD-ROM, writeable optical, SyQuest) will be providing a wide range of SCSI devices for the TT. For example, their SyQuest 44 box retails for $699—quite a bit less than the MegaFile 44.

Discussion turned to FSM-GDOS and why it does not use the popular Adobe Type 1 fonts, of which there seem to be zillions. The answer is that FSM-GDOS (at only $59.95) is 18 times faster than Adobe's Type Manager. Using actual Type 1 fonts would slow FSM down.

Fortunately, there are 155 fonts available now and five developers are working on programs to convert Type 1 fonts to FSM. We could see such a utility by February, 1992.

In an effort to make FSM widely available, the software to construct printer drivers will be easily and cheaply obtained and any drivers must be released into the public domain.

A new and eagerly awaited version of UltraScript is being developed by Imagen. This new version will be a TSR or DA and will accept input from the serial port. This means you could use an ST/TT and SLM laser combination as a postscript printer for another computer. Hopefully, beta testing will begin in February.

By the way, the present version of UltraScript does not print Type 1 fonts and has some problems with a TT or Mega/STe. Solutions: turn the cache *off* on the Mega/STe and use the US6803.PRG patch for TT.

For those of you looking for a CD-ROM drive, Chinon's product will plug into the TT SCSI port with no modification. MetaDos 2, now freeware, must be used to address it. ICD is developing software and an adapter to use the Chinon drive with the ST computers, as well.

Pen-based computing devices (Atari's STylus, Microsoft Pen Windows, GRiD PAD, etc.) are not very accurate—only 75-98% of all characters entered are decoded. This results in customer dissatisfaction. The technology just is not there yet to make this a saleable product. Don't look for such a device to be sold by Atari in the near future.

Upgrades R Us

Ajax is the official name of the Atari chip that handles High Density 1.44M floppy drives. Atari planned ahead because it also does 2.88M formatting. So, we are ready when the cost comes down from $10 per disk.

It is anticipated that an easy-to-install upgrade kit for the Mega/STe and TT (HD drive, Ajax and TOS 2.06 or 3.06) will cost about $100. Apparently, the chips are in production now. Installing a HD drive to an STe might be possible by adding some jumper wires. It will be difficult to impossible to do this on an ST, because a new memory controller handles the clock signal during HD formatting.

For those of you who wish to add TOS 2.06 to your older STs (not an STe), Artifex in Germany (where else) has engineered a hack. *[Ed: This product is now being sold in the US by Codehead Software for $130. See the Bulletin Board column in this issue for details.]*

A new multitasking TOS will probably be beta tested in March. It is designed for an 030. Using it on a 68000 would cut system speed by the number of applications you run at one time. For instance, run four programs and each runs 75% slower.

Tidbits

Some users are bumping into a screen wrap problem when using a Mega/STe with a monochrome monitor and some software. This may be caused by a bad video shifter. Bill said Atari would try to provide a fix, but it may not be available until March.

Huh, say that again—a possible lawsuit over Retouche????

Atari sells 1,000 TTs a month in Germany. The Sunnyvale warehouse has no shortage of the Mega/STe. Under consideration is a 600dpi laser printer which will be available from Lexmart and will be perfectly compatible with existing hardware and software.

I must admit that it was an effort to attend the Chicago show, what with it being the Sunday before the holiday selling season starts and the snow. Nonetheless, it was an effort well rewarded. It was great to see many developers and Atari employees that I had not seen since the AEGIS seminar.

A real measure of success for both dealer and developer is what gets ordered and put on the shelf. Some of the things we ordered Monday include MegaType's Font Pak #4 and #6, Safari Fonts #25, and Migraph's Scanning Tray with Merge-It software.

Unsolicited Bits

Migraph's OCR (Optical Character Recognition) software looks to be a winner. It should be the leader in OCR on the ST/TT.

Bob Brodie & Bill Rehbock (right)

Recently I have become a new, frequent user of Aladdin and GEnie. The combination is great! If you are not a subscriber to an online service, become one.

Atari is offering some really great prices on hardware. If you know anyone who plans to buy a computer, drag them to an Atari dealer and show them the ST.

[About the Author: Mike Drysdale, the owner of Team Computers in East Detroit, Michigan, has been selling Atari products at retail since 1985.]

NO EXCUSES!

20 MEG Hard Drive

$269

☑ Complete system plug 'n go
☑ Premium Quantum Case
☑ Supra SCSI Host & Clock
☑ Case holds 2 hard drives
☑ Free PD Software on HD

Still running from Floppy Drives?

40meg $319

Space for 2 Drives

Same size as Megafile

If your excuse for not purchasing a hard drive is the high $400+ price tag your wait is over. This complete ready to run system costs just a few bucks more than a bare drive! You won't have to give up quality or speed. We use top components such as Seagate, Conner, Sony & Quantum, Supra & ICD hosts. The deluxe 2 drive capacity undermonitor style case is built by Quantum, & is ready for use on the Atari ST/TT computer. (List price for case is over $200 without a drive!) Access times from 40ms to as fast as 4ms, warranties up to 5 years available. ***Limited Quantities !***

Imagine being able to load any Atari desk accessory "on the fly" whenever you like, even while running programs ... or imagine desk accessories that free themselves from memory when you're done with them, so you have more memory to run your applications ... and you've just imagined **MultiDesk Deluxe** from CodeHead Software!

MultiDesk was the first ST program to break through the GEM limit of six desk accessories. Now, the new version has taken another quantum leap in functionality, giving you more free memory, more desk accessories, and faster bootups than ever before.

MultiDesk Deluxe now supports "nonresident" desk accessories which share the same memory space. These DAs are loaded into memory when you select them and wiped out of memory when you close them ... with zero compatibility problems!

MULTI DESK Deluxe

Now Loading:
MAXIFILE.ACC
Hold Alternate to abort

With the help of **MultiDesk Deluxe's** innovative "delta vector snapshot" technique, you can even load and unload desk accessories that take over system interrupts or modify system variables without restrictions or fear of crashing, and without quitting a program or rebooting your computer!

See your favorite software dealer for a demonstration of **MultiDesk Deluxe** today. If you don't have a favorite software dealer, call us right away for more information.

Atari's STBook—A Preview

Bill Rayl

The Chicago Computerfest by Atari was my very first opportunity to get some "hands-on" experience with the new notebook ST. While reading this article, please keep in mind that the STBook is not yet shipping. I'm writing about a yet-to-be-released product.

From what I've been told by Bill Rehbock and others at Atari, the STBook shown at the Chicago show is basically production-ready. It certainly looked like it to me. But, you never can tell—Atari could change *anything* on the STBook between the time I write this and when the product actually ships.

First Glance

The STBook is a very sharp-looking, notebook-size ST computer. Actual dimensions are 8.5x11.4 inches—approximately the size of a standard piece of paper—and only 1.4 inches in height when closed. The entire computer, including hard drive and optional NiCad battery pack, weighs in at slightly over four pounds.

The overall look of the STBook is quite impressive. It's sleek, black case looks great and doesn't smudge easily. An overhanging clasp on the top half of the unit (the monitor) snaps snugly over the bottom half for a tight fit.

The 84-key keyboard had a very responsive feel, not unlike that of the new Mega/STE and TT keyboards. You can, if you prefer, connect a "normal" Atari keyboard to the STBook.

VectorPad

Probably the most talked about new feature of the STBook is the VectorPad, which replaces the standard mouse as a pointing device. The VectorPad appears in the top right corner of the STBook's base, just above the keyboard. This touch sensitive pad is quite remarkable. The harder you press, the faster the mouse pointer moves. Just below the VectorPad are the two "mouse buttons."

At first, I found using the VectorPad a little hard to get used to, but I soon got the hang of it. I noticed that, by pressing firmly on the VectorPad, I could easily make the mouse pointer move so fast that I lost track of it on the LCD screen. In this respect, the display is very similar to the STacy laptop. A little practice with the VectorPad is all you need to get used to it, though.

As with the keyboard, a "normal" mouse can also be connected to the system. So, don't let the VectorPad scare you off if you're a mouse purist.

Suspend and Resume

The other major "neat-o" feature of the STBook is its "suspend and resume" capability. When you close the STBook, the computer automatically powers down, saving a RAM image of what you were currently working on. When you next open the STBook and power it up, you're automatically placed right back where you left off.

Say, for instance, you're typing away in your word processor when something important comes up. You can just close the STBook and go take care of that emergency. When you power the STBook back up later, you're right back in your word processor...right at the exact point you left!

This suspend and resume feature is great when it's time to change or recharge the batteries. You can be in your database one minute, changing the batteries the next and be back in your database in no time.

Batteries

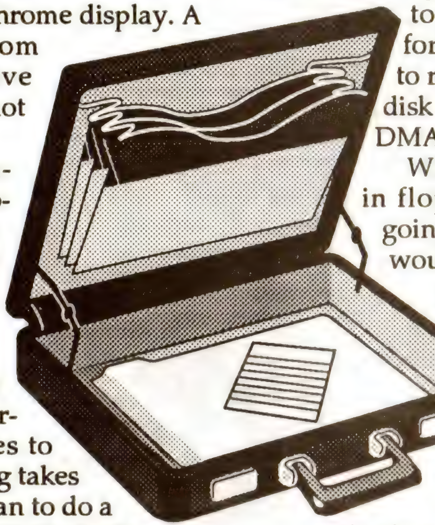
Speaking of batteries, the STBook comes with a battery pack for seven 'AA' alkaline batteries. A rechargeable NiCad battery pack, with AC adaptor, is available as an option. The NiCad pack recharges in under two hours and gives up to 10 hours of continuous use. That's pretty impressive, considering the average battery life of a PC-compatible notebook is around three hours and the new Macintosh Powerbook has a battery life of around 2.5 hours.

LCD Screen

The STBook sports a slim "Super-Twist Nematic" LCD screen with a 640x400 monochrome display. A number of people, most of whom have never seen the STBook, have been knocking Atari's decision of not "backlighting" the LCD screen.

While I can understand the importance of this for some MIDI people, overall I think Atari made a wise choice. The STBook's display is very good. Personally, I think it a little superior to the STacy's display, which is backlit.

One of Atari's main goals in the STBook's design was power conservation—they wanted the batteries to last as long as possible. Backlighting takes quite a bit of power. Unless you plan to do a lot of computing in the dark, don't let the backlighting debate influence you at all.



Specs

Here's where I could really get into trouble, because any of these specifications could change for all I know. What the heck, let's just jump in!

While all the literature distributed by Atari states the STBook uses an 8MHz 68000, Bill Rehbock and others from Atari have stated it will ship with a 16-MHz 68000 CPU, like the Mega/STE. The STBook also comes with a BLiTTER chip.

Atari's spec sheets for the STBook also say the system will come in either 1MB or 4MB of RAM configurations. Unlike Atari's other recent computer releases, the STBook's memory will not be "user upgradeable." Current "rumor" is that only the 4MB version will be released in the US. Of course, that was also said of the STacy and the STe. Time will tell.

Internal hard drive options include 40, 80 or 120MB 2.5" drives with a 19ms average access time. Hard disk utilities are supposedly built into the 512K ROMs in the STBook.

Other software built into the STBook includes a diary/alarm clock/scheduler/calculator package that acts very much like a compilation of GEM desk accessories. Built in file transfer software and a cable (supplied with the STBook) allows the transfer of software from your desktop ST/STe/TT to the STBook.

Ports

That leads us to a discussion of the I/O ports on the STBook. One of the things absent from the notebook is a floppy disk drive. Again, this was a power consideration—adding a floppy drive controller to the STBook meant a big drain on the batteries. So, there is no floppy drive built into the STBook and no floppy port on the computer.

Instead, Atari has done two things. First, they added the file transfer capabilities mentioned above. This allows you to hook the STBook up to your desktop computer and dump files back and forth rather painlessly. Second, Atari plans to release a battery-powered external floppy disk drive, which will connect to the STBook's DMA expansion port.

When I first heard about the lack of a built-in floppy drive, I thought the STBook was going to be in serious trouble. After all, who would buy a notebook if they couldn't easily port software to it? Well, after seeing how Atari has solved this "dilemma," I think they made an excellent decision. I'll take long battery life with an external floppy option any day over built-in floppy and a dramatically lower battery life.

Other than the DMA port, the STBook also has mini-DIN MIDI In and MIDI Out ports, an RS232 serial port and Centronics parallel (printer) port. The 120-pin expansion connector allows full access to the main CPU bus, making it fairly easy to add an ST-compatible cartridge port adaptor, etc. (Can you say "I want my Mac STBook?" Sure, you can.)

Other Options

Aside from the external floppy drive, other optional peripherals planned for release are an internal FAX modem (2400 baud data/9600 baud FAX) and a SMPTE adaptor for the MIDI mavens.

Price and Availability

Here's another area where I could get into trouble! Information from Atari had the 1MB version of the STBook with a suggested retail price of $1,995. No figures have been released for the 4MB version.

At the suggested retail, the STBook comes in only a few hundred dollars less than the low-end Macintosh Powerbook, which also has a 16MHz 68000 CPU.

Depending on who you ask at Atari, you get slightly different projections as to when the STBook will be available. Production is supposedly underway, with a probable shipping date sometime in the first quarter of 1992.

Overall, I think Atari has a winner in the STBook. It's light, has lots of power, has a long battery life and just about everything you could want in a notebook ST. While the price may be a bit high for someone who spent only $700 on a complete 520STe system, the STBook is really targeted more to the Mega/STE and TT crowd.

Professional and semi-professional ST/TT users will find the STBook a welcome addition to the Atari line. Even without the backlighting, MIDI musicians will, I think, be pleased with the STBook once they get some hands-on experience.

For desktop publishers, writers and other professionals who find themselves on the go, the STBook is an excellent choice. It is highly preferable to the 16-pound STacy. With the optional FAX modem and disk drive, the STBook is darn near perfect for anyone needing a portable system.

The NEW
CROSSWORD
CREATOR
II

The fastest, easist to use, and most complete crossword program ever developed for Atari computers

- Not copy-protected
- Extensive online help
- Draft or Final Quality printouts
- Symmetrical Templating function
- Interactive or Word List word entry
- Manual or Automatic word placement
- Smart editor avoids conflicting words
- Saves puzzles in Degas graphics format
- Create huge puzzles up to 30x20 in size
- Complete, illustrated manual (not a text file)
- Easy-to-use interface uses mouse or keyboard
- Works with both color and monochrome monitors
- FAST! Puzzles generated in seconds, not minutes
- Move, Relocate, Delete, Undelete, Resize functions
- Supports all printers (Epson compatible recommended)
- The ideal tool for educators, enthusiasts, or just plain fun!
- Compatible with all Atari ST/STE/TT computers with at least 512K RAM and ST medium or high resolution monitor

MONITORS!

☛ The Atari ST's have always been finicky about monitors. With a seemingly endless array of color monitors on the market (at reasonable prices, too), why should we be bound to Atari brand color monitors? That's a good question. The answer is that the Atari uses *analog* RGB and until very recently, *TTL (digital)* RGB was the norm. Now that the analog systems of VGA and Super VGA are more popular, analog RGB monitors are more popular too. So you'd think the problem would be solved. Lo, a quandary still exists. Now, the mainstream monitors are too fast for the Atari's to use! Most VGA and Super VGA monitors have a fixed horizontal scan rate of 31.5KHz, and the Atari runs at 15.75KHz. So, while the RGB standard has changed in our favor, the speed issue is still boxing us in. When you boil all this down, you get a relatively small set of monitors which will actually work on an ST. This set includes the Atari SC1224 (12") and SC1435 (14") monitors, a few "multisync" monitors (which have the ability to lower their horizontal sync rate to 15.75KHz), and the handful of monitors that, for whatever reason, were made with compatible specifications. We sell them all. If you like being stuck with the Atari name brand monitors, that's cool — we have them. We also have great deals on multisync and other compatible monitors, like the Magnavox 1CM135 and our own refurbished *Toad-RGB* color monitors. With your new-found monitor knowledge, examine our offerings and buy what you need – now, while they're on sale!! And if

The "Toad RGB" Display

☛ When we see a good deal, we don't pass it up. So when we were offered the chance to sell some excellent color monitors, which just happened to work on the ST, we jumped right on the opportunity. The truly spectacular thing about the monitors (excepting the price) is that they support ***three*** kinds of inputs! It's got an ST compatible *analog RGB* port, a PC-CGA compatible *TTL digital RGB* port, and a *composite video* input with separate chroma and luma too! Ponder it: using the same monitor on your ST, a PC compatible and an Atari Eight Bit or VCR! It even has an audio input and speaker! The monitor has a beautiful glossy twelve-inch screen and a picture quality which surpasses even the best SC1224 monitors! The monitors are reconditioned (but are factory fresh), so we know how they work, and that means that we can offer a complete (parts & labor) six month warranty! The quantity is limited though, so order yours ***toaday!*** Please specify ST, Eight Bit, PC, or Cray X-MP connection cable.

Toad's Special Holiday Sale Program Pick of the Moment

M.O.S. Disk Utilities

☛ This new program from newcomer Maximum Output Software will do darn near anything to repair or optimize your hard disk. Is your hard drive slowing down because files are becoming fragmented? Scared and confused because your FAT table is mysteriously corrupted? Boot sector blues? Too many sectors in the fast track? Need a break from endless seeking? Having trouble separating the good from the bad? Confused about the origin of frozen dinners? You need **M.O.S. Disk Utilities.** This program is the best hard disk utilities package on the market today. Includes a 100% efficient defragmenter, FAT, file, and directory repair programs, hard disk tester, bad sector enhancer, and more! Will run on any ST or TT computer and hard disk! Introductory offer.

☛ Buy Now! Only $49!

What You Want Is What You NEED!

1. **NEW "TOAD–DENSITY"** — High Density Floppy Drive Upgrade Kit for TT030, Mega STE, and 520/1040STE. Everything you need to read and write 1.44MB floppies. Comes with enhancement and HD drive mechanism. Fits cosmetically into all aforementioned computers. **Mega STE/TT – $99 520/1040STE – $169**
2. **NEW DC DATA DIET** — Realtime File Compression Utility. Capable of increasing hard disk capacity by up to 50%. This is by far the most popular program we've had in 1991. "Everything seems to work just fine." – Andrzej Wrotniak And so there you go. **ONLY $39! In Stock Now!**
3. **LEGENDARY SPECTRE GCR** — The Best Mac Emulator. That's right boys and girls, the world of Macintosh can be yours with any ST or TT computer. This fine emulator from hacker and mystic Dave Small makes the Mac Classic look like a tricycle. **ONLY $219! MAC 128K ROMS – $300!**
4. **LEMMINGS** — Dare I say this is a yuppie simulator? I hate games, but I love this one. Thousands of little mindless creatures must be saved from the sweaty palm of conformity and you're just the management consultant to do it. Who cares if you lose a few in the process? And if you screw up, nuke 'em with a clean conscience! **ONLY $35!**
5. **ATARI SX212 Modem** — 1200 Baud Hayes Compatible Modem from Atari. Works on ST or Eight Bit. Eight Bit Cable & Software Package – $19. **SX212 MODEM ONLY $29!**

THE CHICAGO COMPUTERFEST—AN 8-BIT PERSPECTIVE

JEFF POTTER

Not having gone to one of these shows before, I was amazed when more than 200 people were lined up at the gate at the opening (10 AM Saturday morning). We 8-bit Classic owners had our own room with about 10 exhibitors. Activity there was pretty good, exceeding what I had expected (I heard over 2400 eventually showed up for all areas, both days). Here's what I remembered:

Atari was reportedly going to "clean out the warehouse" of 8-bit equipment at this show. The really juicy stuff (old 1450's or other rarities) was missing, but some good bargains were to be had. About 10 XEP-80's were scarfed up in the first hour or less for $10 each. Several dozen XEGS (without power supplies) were sold at $25. Some other packages (AtariLab Starter Kits and Light Kits, Visicalc) were sold for $10 each. A bunch of light pens were for sale, until someone noticed some of them didn't work. The LCACE booth then started testing each of them. Near the end of the show on Sunday, the remaining working ones went on sale for $2.50 each (I got mine!).

Bob Puff and Chris Freemesser were there, representing Computer Software Services (CSS). They had a bare-board Black Box connected to a 130XE and were demonstrating its capabilities. I hear they sold a fair number of XF551 dual disk upgrades, which provides a 3.5" disk drive in addition to the original 5.25" drive. They also had a lot of older stuff on hand (I remember "The Pill" and the Richman's 80-column word processor.).

I loaded my newest COLRVIEW program onto Bob's hard disk, and I watched in awe as it took three seconds to load a 24K COLRVIEW image that my XF551 (in single density) took over 30 seconds. Bob said he made enough sales to cover his expenses, and he enjoyed the show.

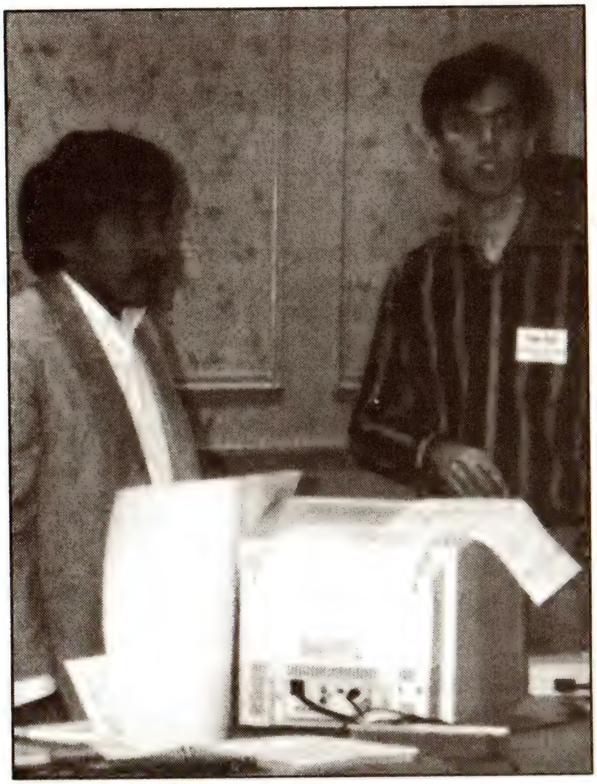
Chuck Steinman was there representing DataQue. He was selling TransKeys (adapter for IBM keyboards to the 8-bit Atari), and various upgrades in his Turbo-816 line. He also did a brisk business in Lynx cartridge wallets throughout the show, and handed out many dozen copies of AtariUser magazine. Chuck also held a seminar Saturday on the future of the 8-bit computers, where he introduced his plans for the 1600XLE and 130XEC models. *[Ed: See the November 1991 issue of Atari Interface for Chuck's article concerning these plans.]*

K.O. DISTRIBUTORS
Our products will KNOCK you OUT!
GENIUS

JD POTTER

The ICD people showed up in the 8-bit room Saturday morning and disappeared to the 16-bit room after only three or four hours. Late Sunday, they reappeared and announced a "blow-out" of the remaining stuff. They had a few MIOs offered at $199 or $249 depending on RAM (which I heard did not sell), and a few copies of SpartaDOS 3.2 and the SpartaDOS Construction Set. No more MAC/65 carts (sigh).

A distributor I hadn't heard of by the name of K.O. Distributors was showing two new games and a paint program. FRED was one of them, which seemed to play a little like a Mario Bros. game. In the game, you guide the cave-



Bob Puff, CSS owner

man around as he jumps from place to place, throwing rocks at animals, etc. MISSION SHARK was a jumping, climbing, shooting game, where you seemed to be infiltrating some high-tech installation.

Both games seemed to keep the kids who visited our room interested. I checked the games on my unmodified 48K 800, and both loaded and worked.

K.O. Distributors was also demonstrating (by videotape) a paint program called EscalPaint. This was showing some striking pictures which the K.O. representative claimed were converted from Amiga picture files (by a program not available through him) and touched up by EscalPaint.

We later checked, and it appears his file format is compatible with the .ILC format that my APACVIEW creates. Note that EscalPaint runs only on a 64K XL or XE system. All programs were written by a couple programmers in Germany for which K.O. is the U.S. distributor. Sales seemed to be pretty good there.

LJK (of Data Perfect/Letter Perfect fame) was there, showing a Video Titler program. It was good to see an old stalwart like LJK still showing up, but I'm afraid his sales were slow.

LCACE and one or two other clubs showed up, selling old stock of commercial programs and libraries of PD disks. Mars Merchandising was also selling old stock of commercial 8-bit programs.

I was there, showing the demo of the "Maze of Agdagon" game (which is not finished). I had brisk sales of all my APAC and COLRVIEW graphics viewers/etc. Happily, a good many people recognized my name and my product. I, of course, tried to show off the best images from my collection of GIF, Amiga and ST Degas pictures to try to draw the "oohs" and "ahhs" from people who'd never seen such a picture from a "lowly" 8-bit machine.

A high point of the show was when a gentleman who runs a computer and electronics store in Akron, Ohio, showed up with his digital camera (a Canon Xapshot). He walked around and snapped photos of us with this, then popped it open to show this little postage stamp-sized disk that holds 50 pictures. Then, he connected a cable from it to one of our monitors and showed us the pictures with remarkable speed.

The images had great fidelity, with no evidence of limited color resolution. He said he sold these for $475, and software for other computers could convert these to GIF and let you touch up the pictures. I'm still wondering if he's going to be able to find us, so we can receive our pictures somehow!

The 16-bit area was much larger, and quite a bit busier. I'll leave the reporting on that area to another source. The Lynx and ST game areas were impressive, with something like 50 STs set up for playing MIDI Maze and other games.

I apologize to anyone I forgot to mention, as the show seemed to go like a whirlwind for me. I was glad to finally meet several of the users and developers who have been in contact with me over the last few years. I'm looking forward to the next show I can attend.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

The Chicago ComputerFest First Impressions

Kest Carter-Morgan
ASTMUM

After clobbering ourselves, by driving from Montreal to both Windsor and WAACE shows, and calculating that the Chicago trip would entail at least eight more hours of driving than either of the preceding trips, we decided to fly to Chicago.

If we had known what misadventures, discomforts and costs would ensue from that decision, we would have bundled into a minivan and driven again! But, we can't all be soothsayers. Once we were flying, the trip was fairly quick and almost painless. (Ha!)

Four of us—Paul Etch, Marc Sauvé, Garry Stocker and myself—arrived in Chicago the Thursday morning before the show. Another entity (in bulky and awkward chunks) came with us—the equipment/luggage.

Our pre-show objectives were to contact organizers and companies supplying additional equipment for our participation in the Fest; visit local specialty record stores to stimulate interest in ASTMUM members' finished works; rent a video camera and a big enough car; and get in some sightseeing before the show.

As we swept south on Lakeshore Drive, towards looming skyscrapers, Paul, an ex-Chicagoan, related important facts about how a fellow named Fullerton bequeathed the lake-front land to the City of Chicago on condition that the real estate not be developed. The City made good on its promise; it didn't erect buildings along the lakefront—it built the very impressive highway on which we were driving.

Almost by a fluke, we ended up at the Science and Industry Museum. Whaddaya know? *Free admission on Thursdays!*

The museum was enormous and could easily consume an entire weekend. However, we had to be selective, and Paul recommended we tour through the authentic German WWII submarine the U.S. Navy had successfully "unscuttled" and, after the war, towed up the St. Lawrence to the Great Lakes and hauled ashore to the museum.

As we went through, we were subjected to just enough special effects to get the imagination working. Fantastic! We also saw a bit of the Chicago-commissioned IMAX film, "ANTARCTICA" (shades of the many large and special format films of EXPO '67), the historic space capsules and much more.

After staying overnight in Chicago, we checked into the Ramada Hotel O'Hare on Friday. Garry and I were quickly plunged into helping a team, led by Bob Brodie and Larry Grauzas, Jr., to move, unpack and set up many Mega/STE4 systems in the DeskTop Publishing seminar room. As more people made increasing demands on Bob Brodie's attention, I was impressed by his ability to maintain his focus and direct important jobs through in proper sequence.

Unlike the mirrored room at WAACE, the main exhibitor area was large, with a high ceiling. Some areas—in particular, our corner booth (#6) and the exhibitor extension (booths 46 through 58)—were poorly lit. Also, the organizers had ordered blue/white draping, but were confronted with yellow. How do you cope with this?

Our rented camera was delayed. While waiting for it near the registration desk, we were treated to a panorama of Atari notables arriving for the Fest. Among them, our own

Geoffrey Earle, President of Atari Canada, was down from Toronto. At the peak of our traumatic cycle, the video camera finally arrived. Now, we were equipped to document the show, wherever possible, for our members in Montreal.

I don't remember exactly how we got roped into it, but we set up our equipment in the Penthouse Ballroom and provided music for the pre-show reception that evening. There were some unlikable aspects to that reception, but there was good conversation and banter (even a tinge of healthy apprehension) about the next day's show.

[About the Author: Kest Carter-Morgan is an audio/video recording engineer, electronic prototype designer and computer repair technician specializing in ST-related projects. He is one of the founding members of the Atari ST/Mega Users of Montreal user group.]

If anyone asks, tell 'em you saw their ad in AIM!

Be a REAL HERO!
for the Atari ST/STe computers

A new dimension in role-playing games that combines arcade action with graphic adventure. Best of all, you and a friend can now save the universe TOGETHER on the same computer or OVER A MODEM!

Adventure enough for TWO!
One megabyte or more of memory required.

Hero!

STeno™
Powerful Text Editor

STeno™ is a complete and easy to use, window based, text editor for your Atari ST, STE, or TT/030.

With STeno you can easily edit any standard ASCII or plain text file. It even has powerful text formatting, *search & replace*, and *auto-wrapping* features usually only found in more expensive word processing packages.

For maximum convenience, STeno can be run as either a desk accessory or as a stand alone GEM program.

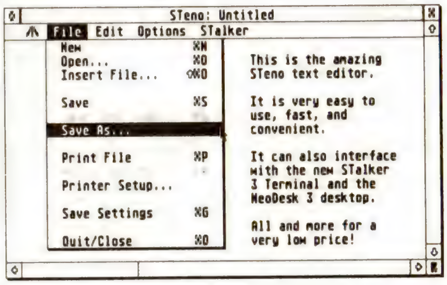
When run as a desk accessory, STeno places its complete drop-down menus inside its own window. This allows full access to its entire menu set from inside any GEM program.

STeno's fast text scrolling, powerful *cut & paste* capability, and efficient *search & replace* function make any text editing job a breeze.

STeno also lets you change the text size to allow more control over how your information is displayed. When printing out your text, STeno will automatically paginate the output and add a descriptive page header.

STeno can even interface with the popular STalker™ 3 telecommunications package to act as a *capture buffer*, *cut & paste* editor, and *type ahead* editor.

STeno works with all Atari computers and can even interface with the popular NeoDesk® 3 desktop.



This is the amazing STeno text editor.

It is very easy to use, fast, and convenient.

It can also interface with the new STalker 3 Terminal and the NeoDesk 3 desktop.

All and more for a very low price!

All this and more is available for the incredibly low introductory price of $29.95. To order your own copy today, call us toll free at (800) 284-4742.

AAAUA ATARI 8-BIT USER GROUP

PRESIDENTIAL PONDERINGS by Alvan Sherrill

On the 6th of December, 1991, we held our fourth annual AAAUA Christmas party. Members and families once again joined together to enjoy good fellowship and the spirit of Christmas while listening to Christmas music and viewing Christmas scenes on our computers.

Larry Allen did a great job in coordinating the overall effort assisted by his wife Hope, Joe & Marion Barth, Jannet & Al Blocker, Gino Giammalvo, Paul Hitzfelder, Mike Lively & crew, Alice Livingston, Oskar Orta, Rose Marie Pettit, Charles Ramos, Thelma & Burl Sunvison, and my bride, Ginny. And not to be forgotten are those who helped clean up after the festivities. Our thanks also to Peggy Blank who made the arrangements for the superb party room. Our very successful party was the result of the collective efforts of many people. Thank you all, including anyone I may have overlooked.

The food committee did an excellent job in preparing a most attractive spread which apparently met the approval of those attending, judging from the rapidity of its disappearance. Shortly after 8 PM the Atari game contest featuring Miner 2049 took place. Tiki Stewart won a Drop Zone disk by Microdaft for third place, Paul Hitzfelder won a joystick in second place, and Bobby Stewart came in first winning, guess what, a Miner 2049er game cartridge! Each participant received an Atari Game patch, which, if worn in plain view on an item of clothing to the January meeting, will entitle the wearer to one free raffle ticket!

Next, we had the raffle where everyone won! Oskar Orta got the Atari 1010 Cassette Recorder, Paul Hitzelder won the Atari 1020 Color Plotter, Mike Lively won the AtariWriter Plus Word Processor, Joe Barth got the Atari Light Pen and AtariGraphics cartridge, and the Atari 400 computer with 48 KBytes RAM and keyboard upgrade went to Thelma Sunvison. All other members who attended won a Solar Star game disk by Microdaft. Our thanks to Honorary member Floyd Blunk, owner of Atari-Ville and Honorary member and past Vice President, John Hardie who either donated or provided most of the prizes at or below cost. Floyd also gave a Lucasfilm BallBlazer disk by Epyx to each member of AAAUA including those who were unable to attend the Christmas Party. The AAAUA gift to members was a Christmas music and graphics disk.

A big surprise to me was being conferred AAAUA Honorary membership by Thelma Sunvision. I was pleased to accept the honor, recognizing that I could have done nothing without the loyal support of the membership and the dedicated assistance from the Board of Officers and several others members. Later, it was my pleasure to present Honorary memberships to Gino Giammalvo and Thelma Sunvison in recognition of their long and dedicated service. They are two of the key supporters of AAAUA who make things happen! I also had the privilege of presenting an AAAUA Certificate of Appreciation to Peggy Blank for her loyal support over the past four years.

I wanted to share this bit of good news with the rest of the Atari user group community because it illustrates what a user group should be. That is, it is not just a cold impersonal gathering of computer users, rather it's warm human beings who enjoy being in the company of others who share their fascination with computers. But this association goes far beyond the technicalities of the digital computer; many close and lasting friendships are formed among the members. At this time of year it is especially appropriate to take a moment to reflect upon our good fortune and friendship. As we begin our 1992 adventure, I want to wish each of you out there in Atariland, the very best of health and happiness in the coming New Year and always.

ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

Before nomination of officers for the new year, two proposals were presented, discussed, and put to a vote. The first was to have a single vice-president instead of separate 8- and 16-bit vice-presidents. It was discussed and passed with no opposing votes. The second proposal was to replace the one librarian office with separate 8- and 16-bit librarians. This proposal also passed with no opposing votes.

The following individuals were nominated for office:

President:	Vice-President:
Eric Converse	Scott Schaffer
Bob Kelley	Barry Tracy
Treasurer:	Secretary/Newsletter Editor:
Kim Stahn	Eric Converse
8-Bit Librarian:	16-bit Librarian:
Phil Volkert	Jim Keller
Scott Schaffer	Rob Magdich

Demonstrations after the nomination of officers included Visicalc and Bobterm on the 8-bit by Scott Schaffer and Hero's Quest on the ST by Mike Surface. Ken Helms brought his Mega STe to the meeting and it was used for the ST demo.

All meetings for the foreseeable future will be conducted on the first Saturday of each month at the Shawnee Branch Library beginning at 10 AM.

Annual membership dues are due now. If you haven't paid then please send $18 to Kim Stahn.

ASTMUM

ATARI ST/MEGA USERS (Montreal)

Our users' group consists of MIDI musicians, composers, videographers, artists, writers, technicians, students, teachers and business people. We also welcome new members, interested in learning about the ST/MEGA (even STE, MEGA STE and TT) models, and their applications, before purchasing.

Founded in 1987, ASTMUM provides its productivity-minded members with technical support, training and emergency assistance (24-Hour, Repair Hotline), laser printing and graphics services, as well as discounts (through participating dealers) on original software, computer hardware and music industry-related equipment.

To benefit its members, and the visiting public, our group has participated in these shows and expositions:

CEGEP Rosemont AtariFest, Montreal, September '88
WORLD OF ATARI, Dearborn, MI USA, June '89
PRODUCTION '90, Montreal, May '90
SIIM '90, Montreal, June '90
Windsor/Detroit International AtariFest, May '91
PRODUCTION '91, Montreal, June '91
SIIM '91, Montreal, June '91
WAACE AtariFest '91, Reston, VA USA, October '91
Chicago ComputerFest, Rosemont, IL USA, November '91

We have kept our members informed of Atari's progress on their most recent models (TT, MEGA STE, ST Book and STylus) through our large periodicals library, videotaped show-tours and interviews with software and hardware developers.

Encouraging members to form special interest groups, we hold monthly meetings (usually the last Sunday of each month) and offer seminars and demonstrations.

Some members teach others, in "hands-on" recording studio environments, at generous discounts. Masters of piano tuning, computer repair and instrument restoration work their magic. Incoming members are impressed by the efficacy with which our specialists troubleshoot the previously unsolvable. Even singers find help for their vocal problems!

In addition to helping ASTMUM musicians market their CDs, LPs and cassettes, at exhibitions and retail outlets, we have assembled a "sampler" cassette highlighting some of their work. You can order this extraordinary, chromium dioxide wonder (ASTMUMusic Sampler, '91-'92) for $12.00 postpaid! Please specify your choice of noise reduction: Dolby B, Dolby C, DBX or Super D (this list will get longer because at least one, new, noise reduction system will be introduced this year). Send your Money Order (in U.S. dollars if you live in the U.S.A.) to our address, below. Make sure your return address is complete and clearly printed.

If you use your Atari to create music or assist in performing it, and would like help in launching and publicizing an independent release, our group may be just the ticket.

Membership information, advice, product list and sampler cassettes may be obtained by writing to:

ASTMUM, Attn: K. Carter-Morgan
P.O. Box 966, Station B
Montreal, PQ, Canada H3B 3K5

or by phoning (514) 272-6631 (voice only)

Executive Exhortations by Kest Carter-Morgan

Many readers are probably aware that we strutted our musical stuff at the Chicago ComputerFest, jointly held by LCACE and Atari, November 23 and 24, 1991 (my serialized account appears elsewhere in this issue).

We also dedicated a considerable portion of our booth to displaying and distributing tourist material and a schedule of events for Montreal's 350th birthday celebration in 1992. Throughout the show, we hinted heavily that Montreal would be a natural for an AtariFest (as early as May or June and as late as September).

We are looking at two possible themes: one that would link local, Atari users' groups and dealers to the annual, Qui Fait Quoi (Who Makes What) Production '92 exhibition which caters to the video, film, music and stage production industries; the other choice would be an all-out AtariFest organized by Atari Canada, some positive-minded dealers and at least 3 local, users' groups.

The first is very attractive because of its music production angle, but has Atari up against other, competing platforms at the show. Knowing that some Atari MIDI and production systems are superior is not enough; we must demonstrate and prove our assertions. If we all do our jobs well, people who have previously dismissed Atari may take a second look - and then some! Even if the activities have to be split between two downtown locations, they could be a short walk apart and still interact well.

The second theme offers a safe scenario of already convinced users patting each other on the back (in the middle of an uncaring world) or, a chance, through proper planning and publicity, to draw in, and welcome, people new to the Atari experience. The encouraging upswing in Atari software quality and exciting hardware developments will have more meaning with new users coming onstream. There will be a lot to show! I know this will require a larger hall than that needed for the annex portion of the first proposal. I'm keeping mum as to my preferred site, for now, but we'll have more time and flexibility to plan for this - if it's in the fall.

Montreal has a strong, if fragmented, Atari community. I can leave my house and walk in almost any direction... and arrive at an Atari dealer within 5 or 15 minutes. I'll be happy to demonstrate this to any visitors (I often do!). To ensure the longevity of our platform, I'm confident that our community will muster the resources and spirit to host such an event.

Some Canadian and American users' groups have made approving noises, but we need to receive more committed responses - soon! If not, the opportunities for 1992 will evaporate. I urge those readers, interested in having a really unique, international AtariFest, to write or call. Let us know what you want!

Adieu for now!

BRAG ST

Buffalo Region Atari Group for ST's

Minutes of the November 21, 1991 General Meeting

The beginner's corner started with a demonstration by Chairman Mark Pierro of MaxiFile III, the super file manipulation tool from CodeHead Software. The regular meeting then began at 7:30 pm with 15 members present.

The first order of business was the election for 4 Board of Director members. Seeing there were only 4 nominations, the vote was unanimous to re-elect Carl Barron, Harv Hontz, Mike Leskow and Lou Krueger.

The meeting went on with general announcements and a discussion of the format of the December meeting. It was felt we should have an informal meeting and instead of demos, people would bring in their favorite game to play. There also would be refreshments and cookies, etc.

The meeting continued with demos of CardFile 3 by Mark Pierro and Outline Art by Mike Burkley. Just before the break, Mark demonstrated some of the PD and Shareware programs put together on a disk for sale at the break consiting of Astro Tunnel, LlamaTron, Color Drachen, EllieMouse Coloring Book, Kid Mixup Plus, Rolling Ronnie and Traffic.

There was a break in the middle of the demo's at which time we had our regular raffle and door prize. Mark Pierro won the software raffle (CardFile 3) and the door prizes were won by Harv Hontz (Disk Head Cleaner) and Al Adams (Disk Box Holder).

The meeting continued with an Open Forum and closed at 9:45 pm.

G.A.U.G. GALESBURG ATARI USER GROUP

Galesburg AUG, 55 Herring St., Galesburg, IL 61401

President Russ Watson (309) 343-6609

The club meets the 2nd Monday of each month at 7 PM at the Community Center on Simmons St., Galesburg, IL, one block south of downtown. New family membership is $10 yr., student membership is $5 yr. Both Atari 8-bit & ST are supported.

Layton ACE of Utah

The Layton Atari Computer Enthusiasts (L.A.C.E.) membership cost $20 per year. Privileges include the AIM Monthly Magazine, access to the 8-Bit and ST club libraries, monthly meetings, monthly AIM public domain disks, help and friendship. If you are presently not a LACE Club member and wish to join contact the one of following persons or write to LACE, c/o Irwin Brooks, 3897 South 2275 West, Roy, UT 84067 or call (801) 731-1516.

Your elected L.A.C.E. Club Officers are:

Mike Russel, President	(801) 546-0707
Doug Hansen, Vice President	(801) 393-6849
Ken Karchner, Secretary/Treasurer	(801) 776-8015
Richard Clark, 8-Bit Librarian	(801) 825-5823
Kelly Knecht, ST Librarian	(801) 773-5652
Irwin Brooks, Publications Coord.	(801) 731-1516

The L.A.C.E. Club Meets in the basement of the Clearfield Library every second Wednesday of the month at 7 PM.

Mark your calendars for the next three meetings:

February 12, 1992
March 11, 1992
April 8, 1992

See You There!!!

MID-OHIO ATARI USER GROUP

The Mid-Ohio Atari User Group (MAUG) will begin meeting at Lex-Tronics starting January 1992. Lex-Tronics is located at 1623 West Fourth Street in Ontario (between Parties Plus and Family Classic Video). Meetings are from 7:00pm until 9:00pm on the third saturday of each month. For more information about MAUG or its meetings, feel free to contact Chuck Steinman at (419) 529-9797 from 1:00pm-5:30pm eastern time.

MAUG supports all the various Atari computer models and their users. AIM is the official user group magazine, and is included as part of the $12.00 annual dues (effective 12/91). Each member in good standing receives AIM each month (or as published) mailed to their home. AtariUser magazine is also available free to local members at the meetings and various other locations.

The club maintains both an ST and 8-bit disk library. We have all of the available AIM disks-of-the-month. These disks are available anyone whether a member of MAUG or not. The AIM ST disks are $4.00 each, and if you purchase three or more at the same time, they would only be $3.50 each. The 8-bit disks are $3.00 each, with orders of three or more being at $2.50 per diskette. These prices include shipping and handling.

The 1992 dues for MAUG membership are $10.00 for all members. Dues which are payed by check or money order should be sent to: MAUG c/o Chuck Steinman, Post Office Box 134, Ontario, OH 44862, USA. Please make the check out to "MAUG c/o Chuck Steinman". Once payment is received, you should expect to see your first magazine in approximately 6-9 weeks. Since orders are placed to Unicorn Publications the second week of each month, you should send your payment to arrive at least a week before that time to minimize the period before your first issue arrives.

Middle Georgia Atari Users Group

M.G.A.U.G.

The Middle Georgia Atari Users Group is the sole Atari Club in the middle Georgia are. We are composed of forty-three members of which approximately half are ST users. The new Club President, Jeff Vincent can be reached by phone at (912) 836-3852. The MGAUG address is RT.1, Box 362 M4, Carl Sutton Rd. Lizella, Ga. 31052. MGAUG meets on the second Sunday of each month at 1:00pm at the Warner Robins Library.

As most of you know, Pete Miller resigned as Club President at our November meeting. Pete remains a member of MGAUG. Our hats are off to Pete for his efforts in keeping the club alive for all of these years.

No one seemed too eager to take the bull by the horns -- so, loaded with a head full of ideas and the abililty to run my mouth in front of a group of people without shame, I volunteered to give it a try.

The December meeting kicked off at the normal time. The biggest area of discussion focused on the proposed changes in annual dues and meeting format.

Member attendance has been on the lean side lately. If you have not been to a meeting in a while, please make every effort to attend the January and February meetings. We are in the process of putting together an agenda that appeals to every member. At the December meeting we discussed the possibilty of raising annual dues. This would help aid in the purchasing of hardware and software for the club. I also plan on having a software drawing at the meetings to help boost interest and attendance. We will try to demo something at each meeting, so please bring your machines!

We also discussed moving the meeting place to a location in Macon where there are twenty-two STs at our disposal, ready to run. We've made no decision yet -- come in and give us your ideas!! This is your club too!

Look for an upcoming 'head to head' TOP GUN tournament (FALCON option via null-modem cable) with a prize for the winner, of course.

The Musician (Riverside Drive, Macon) continues to support ST software, although the selection kept on hand is somewhat small due to the lack of sales. Those of us present at this month's meeting feel that the club should support our only dealer within a hundred miles. So, all software that MGAUG purchases for the club will be bought at the Musician. If you want a piece of software, give the Musician a call. Their prices are competitive with mail-order, and in most cases they can have the software faster than normal UPS or US Mail. If he doesn't stock it, he can get it.

That about covers it this month. Hope to see you at January's meeting. We will be making some crucial decisions and giving away a piece of software, so make every effort to attend!

P3ACE

Serving the Colorado Springs ATARI community since 1982. P.O. Box 17779, Colorado Springs, CO 80935-7779. Annual dues are $20/year. All meetings are held at 7-9PM at the T.J. Maxx Center Community Room, SE corner Palmer Park and Academy. 8-bit SIG meets the first Tuesday each month. ST SIG meets the fourth Thursday each month.

President	Steve Leser	576-3357
VP ST	Terry Quinn	548-1954
VP 8-bit	Rick Reaser	380-8082
Sec/Treasurer	Rick Mount	596-8631
Editor	Sam Cherry	528-5071
ST Librarian	Fred Koch	282-0814
8-bit Librarian	Roger Meston	596-1292

The Prez Sez by Steve Leser

Well, the P3ACE Holiday meeting is over, which means it's time to announce election results. Obviously, we have a new President! Rick has done a great job in the past, but he will be leaving the area soon, so he decided not to run. The difficult task of following in the footsteps of someone who has done such a super job has been given to me.

Terry Quinn was elected to a second term as ST Vice President. Rick Mount is our new Secretary/Treasurer. (Some of our members who have been with the club awhile will recall that he held that post before about two years ago). Fred Koch is our new ST Librarian. (Everyone was thoroughly impressed with his home cataloging system so...) And Sam Cherry is the new editor. On the 8-bit side, Roger Meston was elected to a second term as 8-bit Librarian and Rick Reaser will temporarily take over 8-bit Vice President until a permanent replacement can be found.

Besides elections, this meeting also served as our holiday party and swapmeet. Many people brought goodies to eat, and there was a huge amount of software and hardware for sale, both 8-bit and ST.

This is an exciting time to be leading the club. This year will mark our first full year as a recognized Atari users group. Looking back at the last year, our vice presidents had many interesting topics and guests appear at the meetings. For this next year, I'd like to see if we could get someone from Atari to come out and talk to the club. (Bob Brodie perhaps?) Things seem to really be picking up for Atari, if the Glendale and WAACE shows are any indication. (Good job WAACE!!!)

The Club is in the process of acquiring its large Hard Drive for our BBS. By the time you read this, Laser BBS will be up and running 300-2400 Baud at (719) 527-1374. The entire club Library will be up on the board, along with FidoNet echos! So give us a call!!!

We are also looking to augment our large library of 8-bit and ST shareware and PD software by trading with other clubs. A full list of our available software will be on Laser BBS, but if you cannot call the board, call me at (719) 576-3357 and I will mail you a list.

ST SIG Notes by Terry Quinn

At the October ST SIG, Tim Reyes of Maxwell CPU demoed a new graphics software package, Silhouette. Silhouette is a bit image and vector graphics package with auto-tracing. *It blew my socks off!!!*! It is far superior to similar products for our Macs at work. This program has an amazing array of features. We have some brochures that describe the program fully. Tim also explained how bezier and b-splines work and the limitations presented by GEM. The packaging for the program is also very good. The program costs $69.95 and Tim indicated that he would provide P3ACE members (only) the upgrade to version 1.25 as a part of the original purchase price. Tim also showed us Fractal Fantasy which is also an outstanding program.

It turned out that Tim was pretty late getting to the meeting and fortunately John Peters stepped in and talked about the latest doings with GEnie. He said that GEnie has more business than they can stand and that it is highly possible that more "pay" features may be included in the basic $4.95 service. Shortly after John's announcement, some of this actually happened. Some of the multiplayer games have opened up for instance. John also briefed us on some of the latest Atari scuttlebutt and demoed a few fantastic PD items from GEnie. Thanks John. We had over 30 people at that meeting and although P3ACE members are not prone to rioting, I was getting worried when the speaker was late.

At the November ST-SIG. Terry Quinn showed off his homemade outboard 5-1/4" drive for the ST and we had a talk by the people who are running the Community News Service (CNS) BBS here in town. CNS is a new, commercial fairly small (for commercial) scale BBS which is either 75 cents an hour (in 10 hour increments) or a flat 9.00 a month. They try to offer pretty much the same sort of thing their bigger competitors do only local in orientation. They are particularly interested in acquiring some Atari users since that is currently a weak point in their offerings. To give us an incentive, they handed out brochures with coded numbers worth two free hours.

8-bit Tid Bits by Rick Reaser

The October 8-bit SIG was held at Rick Reaser's house. Eight 8-bit die hards made the event. First, the audience was dazzled by Zebu-Land. Zebu-Land is one of the finest games around and a review will appear shortly. Roger Meston then showed his Christmas videos enhanced through the use of Video Titler (VT). You may remember that Roger won VT at a 8-bit SIG last spring. (Another incentive to make the SIG meetings.) Anyway, Roger is ready for Hollywood now. His efforts were quite impressive.

The meat of the meeting were demos and instruction regarding the various modem terminal programs for the 8-bit. We worked our way backwards through the Express Cartridge, BobTerm, Express 850, AModem 7.5, Chameleon, and Kermit 850. We looked at GEnie and some of the local BBSs and discussed and demonstrated some of the various file transfer protocols. As is traditional for the 8-bitters, the meeting went long. We had a new member visit us, Lee Barnes, from Wild Horse (almost Kansas). We trouble shot his computer to no avail. The Fahrvernungen in his VW van also started to act up when it was time to hit the dusty trail as well. It probably had something to do with the bad chips in his 800XL.

Editor E-Mail by Sam Cherry

The plan for this coming year is to have a little more club representation in the AIM club news section. The president will present his ponderings, each of the SIG leaders will give the minutes of the past SIG as well as SIG stuff and the editor will pull it all together and will keep you up to date on the mundane andministrative stuff. (Since Sam Cherry is moving this weekend, Rick Reaser is filling in this month.) Anyway, all the pieces for the club news will be put together on the Laser BBS and if anyone else has newsworthy items for AIM they should be posted on the Laser BBS.

Probably the most important thing you need to know is that at the last officers meeting, we decided to raise the club dues to $20/year. This will apply to all renewals and brand new members starting in January. The reason for this is to raise money to buy a big Hard Drive for the club's BBS. With a hot BBS, we think the club has a better chance of taking off big time. If the club owns the equipment, we think the BBS will be a lot more stable. We are also going to try to raise money through blank disk sales as well as new fund raising concept of Terry Quinn's -- Team Green.

Team Green is the name of the trash recycling outfit. Their phone number is 540-0128. The cost is $9.90 per month for unlimited trash pickup. If a non-profit organization will sign up at least 20 members, the trash company will write out a check for $1.00 per signed up member each and every month to the organization. You don't have to presort. Apparently they have an automated sorting system which takes ordinary mixed household trash and sorts it at a central location. We'll be discussing this more at future SIGs.

We've got more 3-1/2 inch disks. New 5-1/4 inch disks are still available for 30 cents each. The 3-1/2 inch disks are available for 40 cents each.

The AIM ST and 8-bit Disks of the Month (DOMs) are always available at the SIG meetings for $1. We also have back issues of the DOM. AND we always have a drawing for free DOMs as an incentive to get you to go the SIG meetings.

Also available at the SIG meetings are free AtariUser Magazines. Back issues are also available if you missed one. The club picks up the shipping for our copies and that is all. AtariUser is a pretty neat, newsy little rag.

The club still gets several other club newsletters/magazines which are available for check out at the SIG meetings. These include Current Notes. We have back issues of AIM in the library and have now started to get extra copies in case of emergency (like the mailman missed your house) and for new members.

For our modemless members, the club has a loaner Hayes 300 baud modem and an Atari SX-212 1200 baud modem with cables that you can check out. The SX-212 can connect directly to both 8-bit and ST computers. We also have public domain terminal programs to make these modems work with your ST or 8-bit computer as well.

Pinnacle BBS (599-9059) has apparently gone out of business. For those of you who are interested, John Peters' new GEnie handle is GENIELAMP. Hugh DeLong can be found on CompuServe at 72337,1342. If anyone in the club belongs to a national service and wants to be listed in this column, please let me know. We have only one CompuServe person out there.

Be sure to let us know if you change your address so you can continue to receive AIM and please check your mailing label to see if your dues are due. See you at the next SIG meeting.

THE PORTLAND ATARI CLUB

Treasurer	Robert Yates	851-5134
BBS SYSOP	Robert Yates	552-7053
	Galaxy BBS	552-0974

Hey gang. I hope the new year has started off with a bang for you. Things are going well with the club and membership is at an all time high. The Atari market looks good with many new and exciting products. The desktop publishing market is thriving and the MIDI market is still going strong for Atari. Lynx sales were incredible around the Triangle area this last Christmas. Most of the stores had trouble keeping the units in stock and many reported waiting lists for the new redesigned Lynx Combo Kit.

The Combo Kit includes the new Lynx II, comlynx cable, power supply, a travel case, and the California Games cartridge. This Kit sold for $129.95. Quite a few club members have Lynx game systems and the numbers around the area are definitely growing.

February's meeting will be held on the 12th. Tentatively, we will be be featuring NeoDesk 3.0 and the Mega STe. Please call the BBS and get involved with the club. If you don't have a modem, give me a call (Eric) because the club has 2 modems that we can loan out to members. We'll see you at the meeting.

SCAT SUBURBAN CHICAGO ATARIANS

AN INDEPENDENT COMPUTER USERS GROUP

Meeting on February 1, 1992, the demo will be an Atari TT with IBM and Mac emulators. We as a club have not had a production TT at one of our meeting or looked at a TT in great detail. Greg LaBrec, who works for Atari in Lombard, did bring in a pre-production model in the spring of 1991. The computer being brought to the February meeting is owned by a club member.

The March 7, 1992 meeting will include a demo of an IBM program from Parsons titled Tax Edge. Al Conley will demo this program. He will run the program using PC Ditto II installed on an Atari 1040ST. I have seem this program run and it is impressive. This program also has the capability of sending by modem the tax forms to the IRS.

On tap for the April 4, 1992 meeting will be GAMES. We will have 8bit, 16bit and LYNX games. The titles have not been put in stone, but I am sure there will be something for everyone who attends. The May 2, 1992 meeting will feature the Portfolio hand held computer.

All meeting will be in the K building College of DuPage. I will try and get room K157.

A reminder from the Officers, Members dues of 20 dollars for 1992 are now payable since most membership runs out in March. If you can not come to the meeting please send the dues to our mail Box in Roselle. Hope to see you at the meetings.

Alvin Riesbeck, President

San Diego Atari Computer Enthusiasts

General Meetings are the 3rd Monday of each month at the North Park Recreation Center Social Room, 4044 Idaho Street at 7pm. ST/8-bit workshop meetings are on the 1st Thursday of each month at the North Park Adult Center, 2719 Howard Street at 7 pm. All meetings are open to the public. Annual SDACE subscription dues are $18 which includes increased BBS access, AIM subscription, SDACE newsletter subscription, and reduced rates on the Disk of the Month. SDACE's address is PO Box 900076, San Diego, Ca 92190.

President Dan Phillips (619) 462-1289
Vice President Dean Smith (619) 582-6749
BBS - 24hrs, 300-2400 baud, 80 MB (619)689-8157

Greetings from rainy San Diego (just another great excuse to stay inside and play with our Ataris!). Our December meeting featured a MIDI Maze tournament, which also allowed us to try out each other's different joysticks. The Wico Ergostick seemed to be a crowd favorite, as were the Advanced Gravis joystick, Wico Batstick and the (now obsolete) Epyx XJ-500. Oddly, it was an old Atari 2600 joystick—the original—which won the most games. So much for progress.

Interest in Atari 8-bits seems to be picking up as the economy slacks off. We hope to increase the number of 8-bit programs on our BBS in '92, as well as help stock other local BBS systems which support Atari.

Other plans for '92 include bringing Atari factory representatives to our meetings, as well as other high profile Atari developers/supporters.

STAG
Saginaw / Tri-City
Atari User Group
"where the deer and Atarians play"
ST

The Saginaw/Tri-City Atari User Group meets the 2nd Saturday of the month, at 9 am, at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township, Michigan. Upcoming meetings are January 11th, 1992, February 8th, 1992, March 14th, 1992, and April 11th, 1992. NOTE: We communicate by postcard with our members before each meeting to confirm the location and time of the meetings.

Officers

President	Bryant LaFreniere	(517) 835-2234
ST Librarian	Jim Fleming	793-9792
Treasurer/Secretary	Marty Schmidt	792-6029
8 Bit Librarian	Ted Beauchamp	686-8872

Club dues are still only $20.00, which provides support for both the 8 Bit and ST, and full access to the club's Public Domain library, along with a year's subscription to the Atari Interface Magazine. PD disks are $3 for a double-sided disk packed full of goodies (2 for $5, what a bargain!). Check your mailing label, if you need to renew, (or haven't joined us yet!). A free PD disk is included with each new membership or renewal! DO IT NOW!

At the December Meeting:

With the use of postcards to send the meeting activities to our members before the meeting, we do not need to inform our members of these activities in the AIM magazine. This good communication allows us to be flexible with our agenda.

We tried to have a meeting at Marty's house for the ST group due to the low volume of people that have turned up in October and November. The idea was to prevent the equipment volunteers from taking the time and effort to bring equipment to the library and then have *only 2-3 people show up.* Well, the December meeting at Marty's resulted in 7 ST people that were packed in his computer room. We all decided that if this turnout was representative of future meetings then we will meet at the library. We will try to meet at the library on January 11th.

The 8-bit group is also looking at ways to conduct a meeting. The 8-bit people should contact Ted for more information on the next meeting. Hopefully in the near future, Ted will contribute a separate 8-bit article of the happenings of the 8-bit portion of the club.

The main event for the STers in December was to listen to Darryl talk about the fantastic Atari Show in Chicago. We also look at the ultimate auto-tracing program, Avant Vector (Darryl got a demo disk from the show). If you are serious about auto-tracing a bit- image and converting it to a vector drawing for unlimited sizing without loss of resolution, *This program is a must.* Words do not adequately explain this program. One word of caution: the cost for the program is ~$500 but you can not find a program that would beat it on the IBM or MAC.

In JANUARY:

We will have a swap meet and look at any goodies that anyone received at Christmas. We will communicate equipment volunteers by a note in the postcard sent to the members before the meeting. *Happy Holidays.*

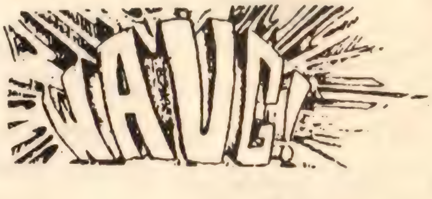
C:\FL\Jacksonville\STargroup
Friends, Fun & Atari STs
DTP MIDI GRAPHX GAMES WP +

The STargroup is a computer club specifically for helping members use their Atari STs. Our yearly dues are only $15 and now include a quarterly newsletter along with a year's subscription to AIM. Other benefits include free access to our library of over 50 megabytes of Lharced public domain and shareware programs for your Atari. The club BBS, the Bandersnatch, has had a fatal hard drive crash and thus no longer exists. We do have a message section on Lief's World (904) 573-0734 thanks to the generous sysop Lief!

The STargroup meets on the first and third Tuesday of each month at the La Mirada apts. off of Powers Ave. in Jacksonville, FL. Everybody is welcome.

President	S. Michael Hallack	(904)646-0567
Vice President	Pat Augustine	(904)737-8452
Disk Librarian	Jeff Holland	(904)737-8452
Secretary/recruiter	Bob Waddell	(904)737-1905

As I write this we are nearing the holidays. December 17th will have been our joint meeting with FACE, which happens to also be a swap meet and Christmas party. We will also be discussing the possible merger between the STargroup and FACE. We have been interested in this for a while, but the minor details are difficult to work out. Watch this space to see what we will be named in 1992. <GRIN>



WAUG GENERAL MEETING MINUTES 12-10-91

The December meeting opened at 7:30 with a table groaning under the weight of cookies, caramel corn, soda pop and door prizes for everyone. Also on the table was the club's STe playing a demo of the GFA Basic game Arena Earth. This game, which can be played over a modem in addition to being playable on one machine, really showed off some of the ST's graphic capabilities right from its opening scene of an exploding alien's head.

Before we could get down to the real business of the meeting, there were some other distractions. President Dave B. explained to the assembled membership what was causing the delay in our group purchase of 8-bit hardware, namely the dearth of participation. Dave then explained that tonite's meeting would be the last chance to get in on the action.

For the benefit of members who were unable to attend, Dave and ST Librarian Mike O. related their impressions of the recent Atari show in Chicago. The descriptions of a room full of 8-bit hardware at fire sale prices, the game room, and the everywhere evident tons of Atari hardware being used by developers showing new and exciting ST/TT programs excited questions from the audience on variety of topics.

Bill Rayl, who was exhibiting at the show, talked about his opportunity to examine the new portable ST Book which he seemed to be very pleased with. Bill also talked about seeing Unix up and running on several TTs and an actual Atari ABC 386 put into duty at the GEnie booth. Some other things that impressed him at the show were new color boards for the ST/TT, optical disk drives that were running on a network of TTs and the Atari supplied Lynx kiosks which featured working machines with not-yet-released games for anyone to play.

While all of this discussion was going on, a new version of the old Christmas classic, Catnap, was being set up on our club STE. This version is complete with music and takes up a full 4 meg of memory to run. The start of the Catnap demo seemed to be the signal that we could finally get down to the real purpose of this meeting -- that of eating, drinking, and handing out door prizes like they would never end.

After all of the door prizes had been drawn and most of the food had been eaten, the meeting adjourned on a cheery note of holiday friendship and good spirit.

Respectfully submitted,
Dan Cable, Secretary

Atari System V
Atari System V

Atari Staff showing off the TT's new Unix System V

It was definitely a first. The Chicago Computerfest by Atari, held on November 23-24 at the Ramada Hotel O'Hare marked the first time Atari has co-sponsored a show. The Chicago Computerfest is a perfect example of what can happen when Atari is as committed to a show as the user group volunteering to pull it off.

With over 50 different exhibitors and eight club booths, plus the Atari area (with three more third-party developers), this show sported more developers than any North American Atari show to date.

Atari's Presence

Atari was also there in force, with over 25 Atari employees on hand, including Greg Pratt, Bill Rehbock, Bob Brodie, Don Thomas, Mike Fulton, Art Morgan, James Grunke, Don Mandell, Mike Groh, Bob Schuricht and Sue Ruck. Louie Moskalski of Atari Entertainment, Art Pruzynski and Diane Gurrero of Atari's UNIX team and Geoff Earle and Mark Campbell from Atari Canada were also at the show.

Every one of these Atari employees was accessible to all who attended the show. From Greg Pratt on down, they were all helpful, friendly and very personable. We personally got a chance to speak briefly with many of these people, some for the very first time, and they were all charming.

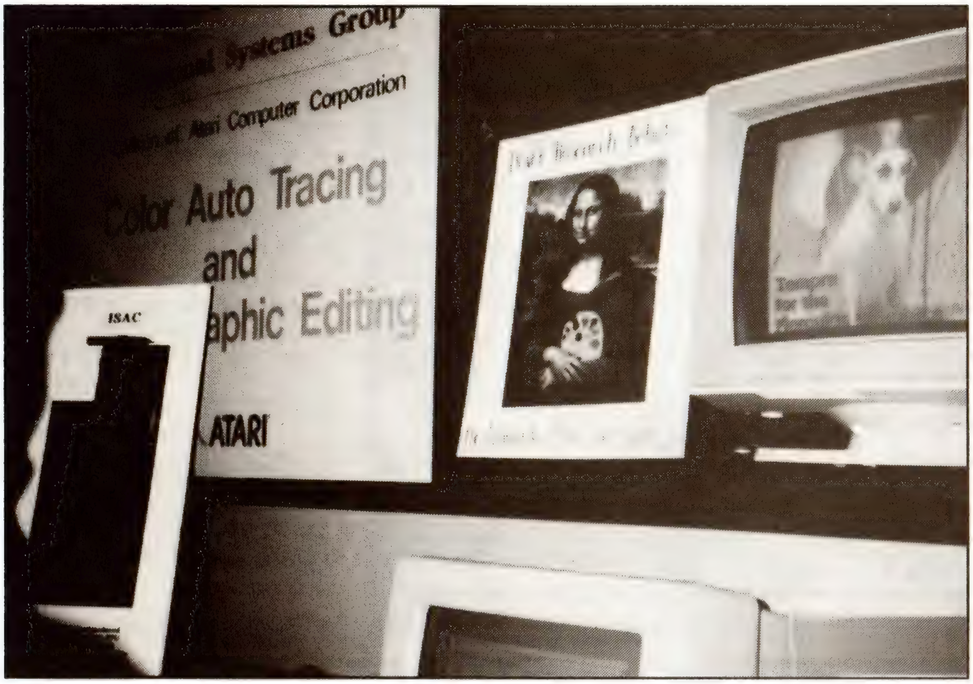
Atari's booth area, taking up 60 feet of floor space, was split up into three main sections—Atari Entertainment, Professional Solutions and a Portfolio area, going from right to left.

The Atari Entertainment Area had the latest Lynx releases (and some soon-to-be-released games), as well as the new Lynx II Deluxe Package. The new packaging includes Lynx, California Games, ComLynx cable, AC power adapter and carrying pouch. New games shown include ISHIDO and Hard Drivin'. A row of three kiosks, each with four Lynx machines, was constantly jammed with people playing their favorites.

The center of Atari's booth was devoted to Professional Solutions. This area was subdivided into sub-sections, with a number of things to see. The area was also heavily packed with people for much of the show, making it easy to miss something of importance.

The STBook was there and we'll devote a full article to our impressions of this notebook computer.

Next up was the Graphics Presentation area. Here, Jay Craswell of Dover Research was impressing everyone with his new Leonardo 24-bit color board with resolution capability up to 512x512. A Targa file viewer, written by Lexicor's Paul Dana,



was displaying photo-quality graphics with 16.7 million colors onscreen all at one time. The Leonardo board is available now from Lexicor Software, with an initial price of $400. Jay says the price will be going up soon, so buy now!

Jay also had his popular ISAC and AlberTT boards, which give you 1024x768 resolution with 16 colors (great for DTP or CAD work) and his new Xyxis 600 meg read/write optical drive.

While I was in this area, Dave Ramsden and Robert Birmingham from Lexicor Software were also there. Robert was showing off some of the new features he's added to Prism Paint, now at version 1.5, while Dave was talking to show-goers about Prism Render and Rosetta-3D.

The TT Jay was using to demo his Xyxis drive was connected to another TT via Ethernet LAN VME card, allowing access to the drive from either system. All this was going on pretty much simultaneously, making for a rather confusing but very impressive sight.

The demonstrations you got to see in this area depended somewhat on when you stopped in. For instance, I'm told Mario from ISD was demonstrating Calamus SL in this area. Instead, I got treated to Lexicor demos. There was a lot going on in this area!

Around the corner from the Graphics Presentation area, Atari had a number of TTs running Atari UNIX System V version 4.0. The systems were all running quite smoothly. The interface, based on XWindows 11.4 and OSF/Motif 1.1.2 was very sharp. Software includes XFaceMaker 2, WISh2 Desktop Manager, GNU C and C++ compilers, GNU gdb debugger and AT&T System V sdb debugger. Atari has a pretty good looking UNIX workstation on their hands here!

Atari's Diane Gurrero and Art Pruzynski did an outstanding job answering even the most technical questions and passing out tons of information sheets.

UNIX Developer Kits are available now. The entire kit includes TT030 with 2MB ST RAM, 16MB TT Fast RAM, TTM195 full-page mono monitor, three-button mouse and choice of 200 or 340MB hard drive.

Finally, the Atari area had a table stacked with Portfolios. Don Thomas and others were showing the new Terminator II startup file for the palmtop, as well as Power Basic and Finance, a small serial printer and 32K/64K memory cards. A number of Portfolios displaying graphic screens (some from Terminator II) were being passed around to attendees.

Let's move on to the developers attending the show. It's going to be tough, but we're going to try to cover each and every company exhibiting at the show.

ST Area

Atari Explorer—John Jainschigg and Peter Donoso were signing up new subscribers and giving out recent issues of Explorer, the official Atari journal. Their new MIDI issue was outstanding.

A&D Software—Application and Design Software demonstrated their Universal NETwork, which now supports the TT and Mega/STE LAN ports. They were also selling the latest version of Universal Item Selector and other software.

Best Electronics—Brad Koda was selling parts and supplies for ST and 8-bit computers. From the Best Mouse and Trackball to hard-to-find replacement parts, Best Electronics is a great source for Atari users.

Branch Always—Darek Mihocka was selling the latest Quick ST 3.0 (now being supported by CodeHead Software). In his seminar, Darek gave show attendees a peek at his new GEMulator, an Atari ST emulator for IBMs.

C-Lab Software—C-Lab was on-hand with their great professional MIDI software, including the extremely popular C-Lab Notator.

Clear Thinking—Craig Harvey, along with helpers Mike Olin and Anna Heinrich, demoed EdHak, text/RAM/disk/anything editor, and Metapsychology Primer, a personality analysis tool.

CodeHead Software—Charles Johnson and John Eidsvoog were doing a brisk sale of their latest import, MegaPaint II. The MegaPaint II demo given by Charles was impressive, and John was demoing MIDI Spy, a background MIDI recording and playback tool. The CodeHeads also had all their other great products, including the new MultiDesk Deluxe. Along with MegaPaint II and Avant Vector from overseas, CodeHeads are now handling the Genus font editor for Calamus fonts as well as Cherry Fonts for Calamus.

D.A. Brumleve—Dorothy, along with the assistance of her sister, debuted the Learning Games Packet, which consisted of 10 educational programs. You could also buy an "Instant Tattoo" Fuji rubber stamp at her booth. You could stop at the booth and get a one-time "tattooing" free, and lots of people wandering the show had Fujis stamped on their hands.

Double Click—Paul Lee and Mike Vederman, two of the craziest guys in the Atari market, manned the Double Click Software booth. DC's new Data Diet was getting a lot of attention, though sales were slow until the second day. Data Diet is one great program that can save you piles of hard drive space. [Ed: See the DC Data Diet review elsewhere in this issue.]

Of course, the guys from Double Click also had DC Desktop, DC Utilities, DC Shower and all their other great products.

Electronic Spinster Graphics—If you're looking for clip art, Electronic Spinster is a great source. Their free 20-page catalog has IMG and vector graphics (GEM-3, EPS or Calamus CVG) for most any occasion or situation.

eSTeem, inc.—eSTeem was demonstrating the multimedia capabilities of their eSTeem PILOT and COPILOT package by controlling a Pioneer laser videodisc player with an ST. Very impressive stuff.

GEnie—While the GEnie booth was unmanned much of the time, users who did stop in got to see an Atari IBM 386-compatible machine, as well as pick up GEnie info kits.

Goldleaf Publishing—Goldleaf had a very impressive display for high-end publishing, including an Epson 24-bit color scanner, TT030 and SLM605 laser printer, along with Didot Professional and Retouche Professional CD (Color and Design). A number of attendees were impressed as a full color photo of a child was scanned in in seconds and imported into Retouche, where the photo's background was removed, the child's clothing colors were changed, etc.

Gribnif Software—The Gribnif gang—Tricia Metcalf, Dan Wilga and Rick Flashman—had a very professional display area that invited attendees into their booth.

Arabesque Professional was the star of the Gribnif booth. This bitmap and vector monochrome graphics drawing program has piles of features and lots of power. Gribnif also announced XBoot, a completely GEM driven boot-up manager from Germany. While the package wasn't available for sale, pre-release show special orders were being taken, and the product was being demoed.

Gribnif's entry in the auto-tracing arena, Convector Professional, was also not available, but has an announced suggested retail of only $99.95 puts it squarely up against Silhouette from Maxwell CPU and well below the price of CodeHead's full-featured Avant Vector. Convector is designed as a low-cost auto-tracer for people who don't need all the features Avant Vector sports.

All the other great products from Gribnif were also being demoed and sold, including Stalker 3/Steno 2, CardFile 3, NeoDesk 3, NeoDesk CLI and NeoDesk Accessories.

Hybrid Arts—After a *long* absence from directly supporting the ST market, Hybrid Arts was onhand, demonstrating their new ADAP II hardware, as well as their great line of professional MIDI software.

ICD, Inc.—ICD was selling their hard drives, host adaptors and software. Their newest hard drive utilities support the TT and allow you to use their boot software without having an ICD host adaptor continually plugged into the TT.

ISD Marketing—Mario Georgiou was demoing Calamus SL in the Atari booth area, as well as playing teacher for the Introductory and Advanced Calamus DTP classes. Mario really knows his stuff, and if you want to see what Calamus SL is capable of, Mario is the best guy to show you!

JMG Software International—George and David from JMG demonstrated HyperLINK, their "hypertext on the ST/TT" application. For the very first time, HyperLINK was shown networking (using A&D's

STeno
Powerful Text Editor
STalker 3
lker 3
NeoDesk 3

The Ultimate Desktop

Rick Flashman (right) showing off NeoDesk CLI

Kaleita Art

Universal NETwork) between a Mega/STE and TT, with full file sharing. Another first, HyperLINK was shown using the 19" TTM194 monochrome monitor. With multiple HyperLINK windows open at once, the large screen monitor was really handy.

JMG was also showing the new "point and click and drag" report generator for HyperLINK version 1.6. The new report generator makes designing reports a breeze.

Kaleita Art & Associates—Kaleita Art had some very impressive T-shirts for sale at the show. The shirts, designed exclusively on ST/TT computers, were fantastic. Kaleita Art has quantity discounts available and they will even print a User Group logo on the back of shirts for 50 cents each (minimum order of 24 shirts).

Mainstream America—Selling ST software for $5 a package and a couple of popular 8-bit games (Drop Zone and Solar Star), this was a fairly popular booth.

Maxwell CPU—The main attraction at the Maxwell CPU booth was Silhouette, an auto-tracing program that was selling for a show special of $75! Expose, a desk accessory graphics editor, was also available.

MegaType—With their full line of excellent fonts and software, MegaType was a "must stop" for all DTP users.

MichTron, Inc.—MichTron was showing their latest release of 3D Calc, a three-dimensional spreadsheet, as well HiSoft BASIC Professional and Stereo REPLAY VIII. A lot of older Michtron titles, including MichTron's BBS 3.0, were also being sold.

Micro Creations—The latest version of GIME Terminal, the only graphic-oriented terminal package available on the ST, was for sale from Micro Creations. Also, it looks like GIME BBS is nearing release.

GIME BBS will support full online graphic menus that GIME Terminal can display.

Migraph, Inc.—This was one of the most popular booths at the show. After a long absence from the Atari market, Migraph is back with a handful of new products and updates.

Liz and Kevin Mitchell showed a beta version of their new Migraph OCR package. The software works with most scanners and uses the popular OmniFont technology, which is widely recognized as the best OCR technology currently available. This package looks to be a real winner, and it gives Atarians one of the best OCR packages available on any platform. Suggested retail is $295, but orders were being taken at the show for $245.

Migraph was also showing their Scan-It tray and Merge-It software combination, as well as the latest Touch-Up release.

Missionware Software—Probably *the* most talked about debut at the show was Flash II, which is being marketed by Missionware. Although not yet shipping, Flash II has an awful lot going for it, including compatibility with previous Flash version .DO files and an interface very similar to Flash 1.6.

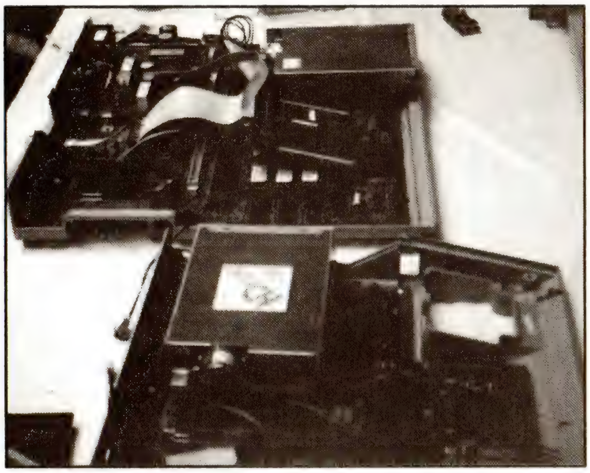
Lots has been added, though, including full ZModem, Kermit, CompuServe B+, WXmodem and SEAlink protocol support; independent configuration settings for each "board"; ability to autodial multiple boards; and the ability to automatically keep track of online costs for pay services, with options for "prime time" and "non-prime time" entries.

Also available from Missionware was lottODDS, a program to help you play your favorite lottery, and Printer Initializer, a utility that creates printer drivers for any printer.

M-S Designs—Another popular stop for owners of Calamus or PageStream, the M-S Designs team was selling their font packages. If you're looking for some excellent fonts, especially fonts for specialty titles, these guys probably have just what you need.

The M-S Designs team was also displaying their newly licensed clipart collection, Wheeler Quick Art. With around 9,000 images in the entire collection, there's a lot to choose from!

These images will be sold in individual packages containing between 48 to 108 images per package, with a retail price varying accordingly. Each package is available in either bitmapped (IMG) or vector graphics (CVG, EPS) formats. Possible CD-ROM releases in the future would have approximately 2,000 images per disk.



The "Norm" board and the High Density kit

Musicode—The Turcsanyi family of Musicode demonstrated their great professional Blackjack simulator Blackjack Plus 3. This program teaches you strategies to win at Blackjack, and it's lots of fun as well. Whether you're a serious Blackjack player trying to make a living playing cards or someone who plays for entertainment, Blackjack Plus 3 is a great buy.

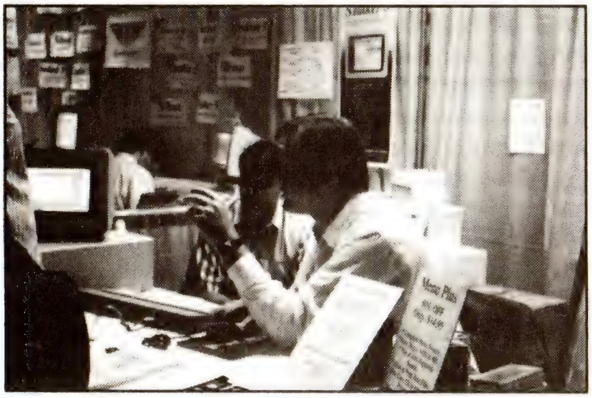
OPI (Wuztek)—Omnimon Peripherals, Inc. had their DEKA IBM keyboard interface and Omnimon Rainbow monitors at the show, as well as a prototype of their graphics card (the Norm board) and HD Drive high density floppy drive kit.

Oregon Research Associates—Diamond Back II is probably the best hard drive backup utility available on the ST/TT, and show attendees got a chance to see the software in action at the Oregon Research booth. With the ability to back up even Spectre hard drive partitions, this software can't be beat if you're an emulation buff.

Phil Comeau Software—Phil Comeau was showing his popular GramSlam grammar checker and his latest version of the new Grammar Expert, an online reference for the rules of English grammar. Phil also had his TreeSaver printing utility and his MIDI tools.

Rimik Enterprises—Rich Betson of Rimik demonstrated the multitasking capabilities of MultiGEM, along with the new MultiGEM Utilities for multitasking printing, disk formatting, etc. The desk accessory paint program DTPaint and Menu Plus, a program launching menuing environment, were also displayed.

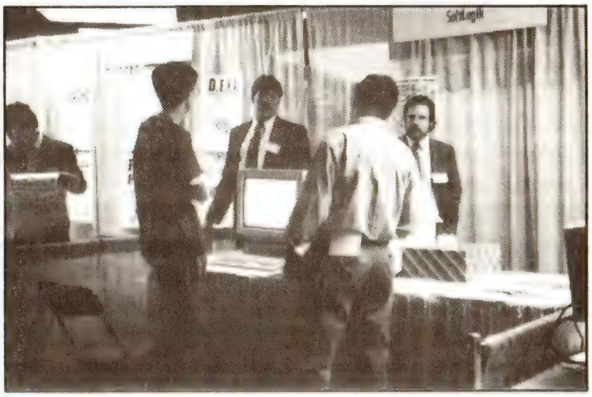
Rimik's Rich Betson



Roland Corporation—Near the Hybrid Arts and C-Lab booth, Roland Corp. was displaying their MIDI equipment, including keyboards and rhythm controllers. MIDI enthusiasts definitely had a lot to see at this show.

SKWare One—Seurat version 2.2, a full-featured paint program, and ColorScan, a program that colorizes monochrome IMGs were both ably demonstrated by the author, Kelly Webb. Also available at the booth was a package called Auto-Art, which consisted of five programs for "creating artforms and spectacular screen displays."

Soft-Logik Publishing—Soft-Logik's Mark Wetzel and Dan Weiss were showing off PageStream's color output capabilities, directly printing to a SpectraStar color printer. Lots of Soft-Logik's new font packs from Image Club were also available at the booth. Dan Weiss also handled the PageStream Introductory and Advance classes.

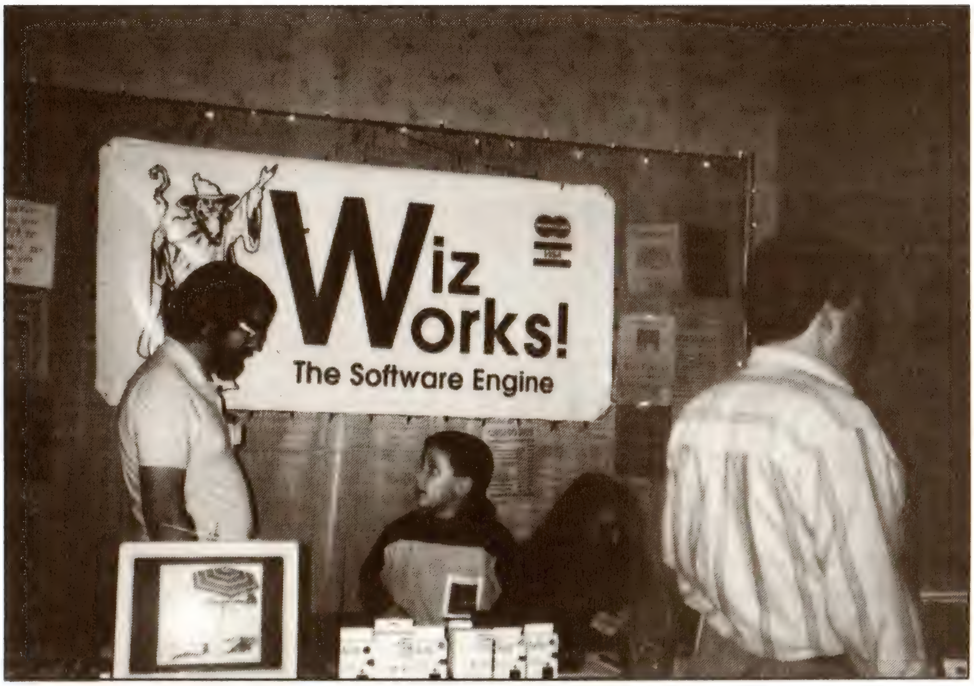


ST Informer—Mike Lindsay, Chris Latham and Deron Meer from the ST Informer staff were all on-hand (they were also manning the A&D Software booth). Free copies of the latest ST Informer were available, and attendees could subscribe at the booth.

Step Ahead Software—Nevin Shalit was demoing his latest and greatest Tracker/ST 3.0, the premier mailing manager software for the ST/TT. Tracker 3.0 is the perfect software for anyone who has to keep track of any names and addresses, perform mail merges with form letters or handle subscription/membership information.

Sudden, Inc.—Until you've seen Ronald Coleman demonstrate his SuddenView text editor, you probably haven't seen just how powerful this software is. If you need an editor that can cut and paste columns, among other unique features, check out SuddenView. It's a whole new way to edit text.

Unicorn Publications—Yep, we were there, too! We were selling copies of Atari Interface for $2, as well as our ST/Mega, Atari 8-bit and Mac/Spectre Disks of the Month and AIM T-shirts. We also handed out around a hundred disk catalogs and CompuServe sign-up kits with $15 usage credits.



WizWorks—WizWorks made a *big* splash with their release of ScanLite, software that allows scanning and saving of graphics from within almost any program. As a desk accessory, ScanLite can be interfaced with nearly any program.

The CodeHeads were so impressed with ScanLite, they decided to create a MegaPaint module to support it. At only $20, this software is a *real* bargain. ScanLite works with Migraph, GeniScan/ST, Golden Image and DAATAscan scanners.

WizWorks also debuted their scanning tray—called simply The Tray—and their Coalesce merging software. The Tray is actually produced by The LYRA group and has been seen in a number of PC magazines. The Tray is used to scan a full page with a hand scanner, using two passes, half the page at a time. The Coalesce software merges the two scans into one complete 8.5x11 scanned image. The package is very similar to Migraph's Scan-It and Merge-It package, but at a significantly lower price.

Of course, all the other great software from WizWorks was also available, including Image Cat, Mug Shot and MVG. Four Mug Shot data disks and three MVG modules disks were also for sale.

If you hadn't already grabbed enough clip art at the show, WizWorks had over 50 disks of excellent quality IMG graphics from CHQ, Inc. Other items from CHQ included NeoDesk and DC Desktop icon disks (over 1200 icons per disk!) and DeskJet refill kits in multiple colors.

Zubair Interfaces—Abu Zubair was at the show with his impressive line of hardware add-ons, including the Z-Keys IBM keyboard interface, Z-Scan scanner interface, ST/Time clock/calendar and memory upgrades.

Classic 8-bit Area

Unlike most shows, the Chicago Computerfest had a special "8-bit Appreciation Area" where 8-bit developers and users could gather apart from the ST/TT portion of the show.

A number of developers had tables in this area, and it was very popular to the 8-bit attendees. Since we have a special 8-bit report from J.D. Potter in this issue, look for his article for details on who exhibited in the 8-bit area.

Dealers

There were a number of dealers' booths scattered around the show floor, mostly from the Chicago area—Apple Annie from Park Ridge, IL; Compu-Seller West of St. Charles, IL; CSA Ltd. from AMF O'Hare, IL; Guitar Plus, a MIDI dealer from Arlington Heights, IL; Mars Merchandising of Lombard, IL; and One Stop of Chicago, IL. Dealers from outside Illinois included Toad Computers of Severna Park, MD and Rising STar of Dayton, OH.

To give you an idea of the kinds of bargains to be had, Compu-Seller West was selling the Lynx Deluxe Pack ($149 retail) for $125. A TT030 with 2MB of ST RAM was going for $1579, while a Mega/STE2 with 50MB hard drive was selling at $1329, a Mega/STE1 was only $929 and a 1040STE was going for just $399.

User Groups

User groups having booths at the show included ASTMUM of Montreal, Quebec, Canada; EAUG of Alton, IL; GCACE of Chicago, IL; LCACE (co-sponsor of the show) of Waukegan, IL; MAST from Milwaukee, WI; MilAtari of West Allis, WI; RACC of Rockford, IL; and SCAT from Roselle, IL.

At each club booth, attendees could become members, buy disks from the club's PD libraries, ask for unbiased info about products being sold at the show, or just chat about what user groups are all about.

Also at the show was a special MARC booth. MARC stands for Midwest Atari Regional Council. The organization is made up of individual user groups in the Midwest and its purpose is to act as a channel of communication between the member clubs and Atari product manufacturers, including Atari. MARC charges no dues to clubs for membership in the organization.

At the banquet on Saturday night, MARC presented their first annual awards for excellence. (Hey, maybe they should call them the "MARC of Excellence Awards?") The awards are presented to select developers "for their outstanding contributions to the better-ment of the Atari community." This year's awards went to Double Click Software, Soft-Logik Publishing and CodeHead Software.

All's Well That Ends Well

The show closed on Sunday with a total attendance of around 2,300. Saturday was, by far, the busiest day attendance-wise, which is typical for these shows. About an hour before the show opened on Saturday, well over 200 people were lined up at the doors, waiting to get in. From the moment the doors opened to close of show on Saturday, people were everywhere.

Surprising to many, a respectable number of people coming to the show were not Atari owners, and some attendees didn't own a computer at all. Atari's placement of ads on radio, newspaper, etc. for weeks before the show helped bring in some of the general public. While these people didn't buy much, their presence was a welcome sight.

On Sunday, there were far fewer people, but the ones that were there had money to spend. In fact, many of the exhibitors had far better sales on Sunday. This is also fairly typical of these shows.

From a profit standpoint, the Chicago show was our very best show ever, beating our previous all-time best—the WAACE show just a month earlier—by about $150! Other vendors reported anywhere from phenomenal to "so-so" sales, but everyone we spoke to said coming to the show was well worth it, and no one we spoke with lost money on the show. Considering there were so many exhibitors to buy from, and the current state of the economy, that's pretty darn good.

Will there be another Chicago show sponsored by Atari next year? Well, we'll have to wait and see. Atari has indicated they want to have an annual Midwest show, along with the East and West Coast shows. Mike Brown of LCACE urges everyone who wants to see another show in 1992 to write to Greg Pratt or Jack Tramiel at Atari, thanking them for their sponsorship of the Chicago show.

Atari really did go all out to make this show a big success. Special thanks go to Bill Rehbock and Bob Brodie. They bent over backwards to take care of everyone's needs, and they succeeded. Together with Mike Brown, Larry Grauzas and others from the LCACE club, these guys put on one heck of a show.

NEW!

MAILING MANAGER ST™

The Ultimate mailing list program for your ATARI ST/TT™

Whether you need a program to keep track of 30 or 30,000 people, MAILING MANAGER ST is for YOU!

Here are just some of the features:

* Works on all ATARI STs, STEs, MEGAs and TTs.
* Runs on a 520ST with single-sided drive. (Up to 600 Records.)
* Operates on both color and monochrome monitors.
* Easy to learn and use.
* Up to 32,000 records per data file.
* Two unique phone numbers per record. (Home, Office,Fax,..ect.)
* Time saving Default entries.
* 20 programmable function keys.
* Very fast. All records are stored in memory.
* Fast and powerful search. Search by one or more fields.
* Supports all parallel and serial printers. (Laser too!!)
* Flexible and powerful mail merge feature.
* Print labels in any format. One, two, three or four labels across.
* Unique high speed Sort. Each record can be independently sorted by ANY word in the name field.
* Powerful Mailing List feature allows selectively tagging certain records for printing.
* FREE back-up disk included!

USER'S GUIDE FOR DAISY DOT III

Ellen Lentz (ACCT)

Seldom does the mail bring anything interesting—usually bills, ads and other junk mail.

Imagine my surprise when I received a manual from David Richardson, with a request to write it up for AIM. This manual is entirely public domain, and has been endorsed by Roy Goldman (author of Daisy Dot III, 2440 S. Jasmine, Denver, CO 80222).

Low Cost Packaging

The manual is entirely on disk and, when unARCed, fills up both sides of nine single-density disks. If ARCed and in double-density and double-sided, it fits on three disks.

This manual almost has to be seen to be believed. It consists of a three-page Author's Notes, an index to the fonts used, 47 pages of text, and three articles which David had printed in his Newsletter, including an excellent article on creating fonts and one on double-column printing.

The original 50 fonts included in the copyrighted version of Daisy Dot III are printed in their entirety. Instructions on setting character and line spacing for best results are included, as well as indications of which characters have not been or are being used for special characters.

In addition, 59 extra fonts are included, of which 18 are fonts composed of 430 icons, translated from PrintShop, which can be printed in Daisy Dot III documents. There are also 10 graphics fonts. These fonts consist of pictures converted from digitized images or computer drawing programs such as Micro-Painter or Micro-Illustrator. Instructions on how to convert them are included.

There are several very special fonts. One creates a Crazy Dots game, the "Dotty" game of geometric designs. Another is a chess set which can be used to print out a layout of a chess game. There is a crossword puzzle, with fonts for both the puzzle and the answers. There is a font with grids to make your own graph paper, and one to make your own Yahtzee score sheets.

In addition, there are fonts to print Morse code, Braille and Handsigns for the deaf. It is a truly remarkable presentation and represents many, many hours of work and ingenuity by David.

To print the manual, you must have the registered version of Daisy-Dot III, which allows you to change fonts within the body of a document. This is available for $25.

There is a customizer with this program which allows you to set margins, line-spacing, etc. but the only thing you should change is the selection for your printer. Leave everything else the same.

Each page is on a disk side with the appropriate font files, so you merely print each file that does not contain the extender for the fonts (.NLQ). If you have a RAMdisk you can load the files into that, and the text files will print much faster, as there is a lot of switching between the font and text files.

To print the crossword puzzle, Page 14, you must print the first file, then roll the paper back to the beginning and print the second file. For the third Fontier file, you must print the odd pages first from the first file, then roll the paper back and print the even pages from the second file. Other than that, you just print each page one at a time.

A Few Extras!

If you request them, David will also send you four other programs—PS2DD3.ARC converts Print Shop icons to Daisy Dot III format; GR8TODD3.ARC converts microscreens to Daisy Dot III format; and FNTSPLIT.MAC and DD3.MAC are macros designed by John McGowan to be used in TextPro to split screens horizontally so they can be used for letterheads, etc. and to easily enter Daisy Dot III commands into TextPro.

Since this manual is public domain, there is no charge for the disks, merely enough to cover the cost of the postage and mailer. For the manual, send five disks formatted in single-density (or 3 disks formatted in double-density) plus $3.50 to cover the shipping/handling to

David Richardson, PO Box 746, Lawrence, KS 66044, ph: (913) 843-5213.

Once you have received the disks, you are free to copy and distribute them as public domain. If you have received the manual from some other source, David would appreciate it if you would let him know that you have it, and where you got it, so he can send you updates and perhaps a newsletter.

This is a truly remarkable manual, and congratulations to David Richardson for making it public domain. It is users like this who help keep Atari "ALIVE!"

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required.

$39.95

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945.

$14.50 ea.

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game.

$25.00

KEYBOARDS

New and complete subassembly.
Easy internal replacement.

Answers, Tips And Relevant Information

Paul Alhart (AFED)

Paul's Most Excellent Journey

On a recent drive from the East Coast to the West Coast I did something different. I took a couple issues of AIM along with me.

Sure, I wanted to show Mom that I finally got my name in print, but that wasn't the only reason for taking them. By using the information from the User Group section of AIM, I was able to contact lots of other fellow Atarians on my trip across the States. Besides being able to share valuable information regarding user groups, software, hardware, etc., it was like having an old friend or two in every state.

Bob Puff and CSS

While spending some time with my Mom in Rochester, NY, I was fortunate enough to get to meet Bob Puff. Bob is probably best known as the author of BobTerm and the Arc utility programs used on the AIM 8bit Disk of the Month.

Bob also, as of June 91, has taken over the reins as president of Computer Software Systems. CSS has a full line of hardware/software enhancements for the 8-bit Atari computer and disk drives.

I had seen CSS ads in magazines, but I never saw any of their hardware out here on the West Coast. After Bob demonstrated a few of the company's products I was impressed. There really are companies still supporting the Classic Atari.

One of their products is "The Black Box." This little beauty not only gives you a parallel and serial port, a machine language monitor and a whole lot more, but it also allows connecting a hard drive to your 8-bit. After seeing the Black Box in action, I can only say I was truly amazed.

CSS has just printed up their new catalog that includes detailed descriptions of their entire product line. Give them a call at (716) 429-5639 and ask for it. It's *free.* Be sure to tell them you heard about it in AIM.

Off to Nevada

On another stop, in Nevada this time, I hooked up with an old friend from my past. He confided to me that he had an Atari 800XL and 1050 disk drive. It was all in a box in the closet. He thought it was only good for games and his mentally/physically handicapped son found the Nintendo much easier to use.

Did I hear someone groan?

Well, after telling them how the Atari could be used for education, productivity, music, art and communications as well as entertainment, I had their interest. As soon as I got home, I put together some PD educational software I had and mailed it off to them.

I am happy to report that their Atari is now back on the desk where it belongs and is opening up a whole new world for their son, Jeff.

Jeff is 18 and just learning to read, so easy-to-use educational software and the Atari could make a real difference in his life. If you know of any appropriate software you think could be of assistance *please* let me know.

I had hoped to drop in on a few user group meetings during my travels. The meeting dates never seemed to match up with my nightly stops, however.

To make my next trip an even *more* Excellent Journey, I *will* consider meeting schedules *before* I plan my route. I'll also be sure to have the latest issue of AIM sitting on the seat beside me. If there is room, I'll take my trusty Atari and modem along too. I guess a few blank disks wouldn't take up too much room. And a printer would be nice and....

Help Jeff

Use your Atari to do a good deed today. Fire up that disk library program you have and see what good software you can find that may be of help to Jeff. If it is PD or Shareware, put it on a disk and send it along to AIM for use on their 8-bit Disk of the Month.

Any information or software donations can also be sent to me. I'll be happy to forward them to Jeff and his family.

Thank you!

Paul V. Alhart
524 North Zee St.
Lompoc, CA 93436

Want to get the most from your Atari investment?

Subscribe to *Atari Explorer*, the Official Atari Journal! Each issue of *Atari Explorer* is filled with reviews, tutorials, hints, and late-breaking news to help you keep pace with the fast-changing world of Atari products! And *Explorer* is the only Atari magazine that covers the full range of Atari equipment — from the exciting ST and TT computers, to the 8-bit home computers, to the amazing Portfolio palmtop MS/DOS computer and the Lynx Portable Entertainment System — so whatever Atari you own, you'll always find something new, relevant, and exciting in our pages!

Six issues of *Atari Explorer* are only $14.95 — a savings of 15% off newsstand price! That's a small investment that pays BIG dividends, when it comes to getting the most from your Atari! So what are you waiting for? Subscribe today, and plug into the most useful Atari peripheral money can buy: *Atari Explorer Magazine*!

DC Data Diet

[This article appears courtesy of Roy Barr and the Midlands Atari Computer Enthusiasts of Orangeburg, SC.]

"Save megabytes of storage space," the ad touts. "Don't buy another hard disk....Save 65%-80% on word processing documents alone!" I am speaking of no other than DC Data Diet, the new real-time compression utility by Keith Gerdes from Double Click Software. Does it deliver? Read on.

Double Click Software has been known to pack a lot of punch into a small package, and Data Diet is no exception. The packaging is like most DC software—a black and white manual, shrink wrapped, with a disk stuck between the pages.

No flash. No big, fat bulky box—just the bare essentials, and there is nothing wrong with that. Some software today is nothing but flashy packaging. Probably a large percentage of the price goes toward that big, fat color manual, great colorful artwork on the box, poster and that button or bumper sticker.

The Manual

Upon tearing through the plastic, you find a 48-page Owner's Manual, a registration card and, of course, the disk. Mike Vederman has done a good job with the manual. It starts off with a note about piracy and goes into explaining some of the notations and icons used throughout the manual.

He also explains a little about the basics, such as using the file selector. Experienced users can skip this section. But, it is here for the beginners, and they would most certainly be able to get Data Diet up and running quite easily.

Next comes the quick installation section. Those who would like to jump right in would start here and just follow the eight step plan to install Data Diet. Then, reboot and you are dietizing.

It would seem from the ads that Data Diet would just be for hard drives. But, I think most floppy users could benefit from it also, especially if they have enough spare memory for a large RAMdisk. Data Diet would be great for saving those download directories from your favorite BBSes.

Roy Barr

Midlands ACE

Dietizing

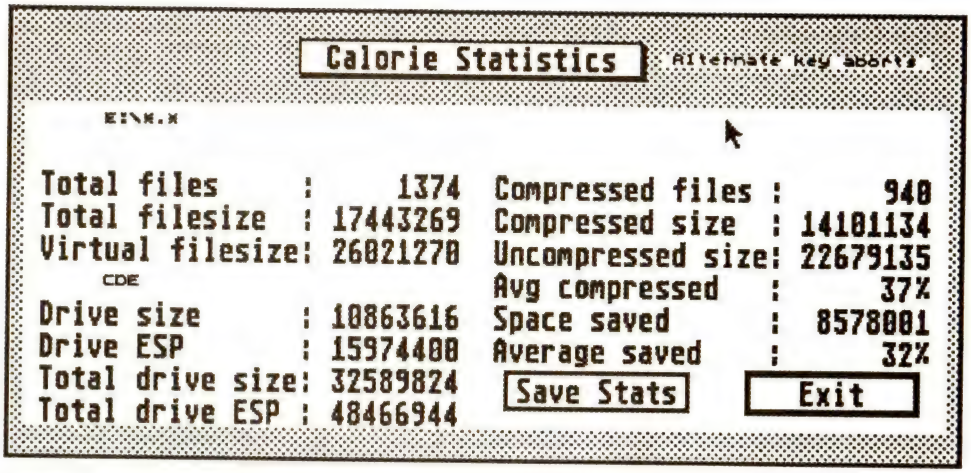
The dietizing process alone works by compressing—or "dietizing"—all the files on your disk except for PRG, TTP, ACC or TOS files, and any others you wish to exclude. DC Squish is included for compressing programs—more about this later. Data Diet takes all other files, compresses them and replaces the original files with the dietized ones.

Doing this may seem a bit bold with a hard drive, but I dietized one partition and tested it thoroughly and had no problems. So, what the heck, I dietized my whole hard drive.

Data Diet does indeed compress most files 40 to 50 percent. On my whole hard drive, the average compression was 37 percent, with my total files being 1374. Pretty darn good.

To dietize a file, you can either have Data Diet installed as an accessory or use it as a program. I have mine as an accessory. I just call up Data Diet and the main menu pops up with a list of files being uncompressed in the current session.

Right now, while I write this in Word Writer ST, Data Diet shows I have five files currently being used. It also shows which method of compression is used for each file. Method "A" is said to be fast. Method "B" is supposed to give better compression. I have never even used "A", because "B" seems plenty dang fast for me.



```
E:\*.*

Total files       :     1374   Compressed files :      940
Total filesize    : 17443269   Compressed size  : 14101134
Virtual filesize: 26021270   Uncompressed size: 22679135
   CDE                           Avg compressed   :      37%
Drive size        : 10863616   Space saved      :  8578001
Drive ESP         : 15974400   Average saved    :      32%
Total drive size: 32589824
Total drive ESP : 48466944
```

Clicking on the name of any of these files being used gives you the stats for that file. For example, if I click on the WW2.RSC file, I'm told the uncompressed size is 28,200 bytes, the compressed size is 15,011 bytes, the compression percentage is 46 percent and the status is "decompressed."

The process of dietizing your files only needs to be done once. Dietization is automatic once you have batch dietized all your files. Files can also be un-dietized and returned to normal—"normalized" in the Data Diet terminology.

Exclusions

Some files do not take well to being compressed—ARC and LZH files, for instance. Don't fret yet! Data Diet includes a DATADIET.INF file which allows you to exclude certain file types, paths or even individual files.

You can also exclude drives/partitions. I have my A:\ and B:\ drives excluded. Anything that is written to those drives will *not* be dietized.

How It Works

Let's get into how Data Diet works. If you do not want to bother with all the technical how-it-works stuff, you can just sit back and let Data Diet do its job. You don't have to do anything special in order for it to work. It just sits there in the background, waiting for a file to be accessed. But, if you're like me, you want to know what makes this thing tick and how to make your system run more efficiently.

Any time a dietized file is accessed, that file is uncompressed and written to a work directory. When a program needs to use that file, the program is redirected to the copy in the work directory. If you change the file, or write to it, your changes are again redirected to the work file and your changes only affect this file.

When you exit the program, the file(s) in the work directory are dietized and written back to their original location(s). Then, the copies in the work directory are deleted. Simple, huh!

The only drawback is in the unloading time. For example, I was in Flash on a long distance BBS. I was getting ready to download using YModem/G. I hit my F8 key, which is set up to run the YMG program, and I expected it to pop up immediately like it always does. However, my work directory needed flushing, and that took about five seconds. No big deal, but anybody who knows me knows I like to squeeze every penny out of a long distance call.

The way around this, though, is to call the Data Diet accessory and click on Flush&Del Work before making the call. This compresses all current files, writes them to their proper places and deletes them from the work directory. Then, if I call the BBS and run YMG, it pops right up.

There is another option where you can have Data Diet dietize constantly. But, as the manual warns, this is much slower than dietizing when "terminating" a program.

If, for some strange reason, your computer bombs (I know this has *never* happened to you, but someday it might), your files are safe and sound in the work directory. Just reboot and they are written right back home.

You can specify a RAMdisk as the work directory, but be sure to use a reset-proof one. I really can't bring myself to use one, though, because a RAMdisk is not tangible, like a hard disk. But, using one would certainly speed things up.

DC Squish

DC Squish is included in the Data Diet package. DC Squish compresses executable files—PRG, TTP, TOS and ACC files—while keeping them completely runnable right from the desktop.

Whenever you run a Squished file, the words DC Squish show up in the left corner of the screen while the file decompresses itself. It is *extremely* fast. PageStream 2.1 decompresses in about two seconds.

Calorie Counting

You can monitor the amount of your compression by clicking on the Calories button in the Data Diet Tools program. This gives you everything you could ever want to know about Data Diet's performance. You can get statistics on the entire drive, certain partitions or even specific paths.

Once you've made your choice, you are presented with a plethora of information including total files counted, total file size (actual space used for storage), virtual file size (the amount of space the files would take up in an uncompressed state), number of compressed (dietized) files, space saved, average compression and much more. A Drive ESP statistic calculates the theoretical new size of your hard drive [(Drive Size * Average Saved) + Drive Size].

The statistics I got for my Megafile 30 are shown in the Calories Statistics picture. What the statistics boil down to is that I saved 8,578,001 bytes—eight and a half megs! And, I now have the equivalent of a 48-and-a-half meg hard drive! I saved 32% of my total hard drive space. Pretty neato!

Conclusion

It is really hard to find fault with this program, but I guess if I had to find one, it would be the time delay when you exit a program. This is a very minor delay, and if you use a RAMdisk it would hardly even exist.

There are many more options to this program than I was able to cover here. I would highly recommend Data Diet to anyone that has to delete files from their hard drive in order to add more files. Data Diet really does save you megabytes of disk space!

Use Data Diet until you get a bigger hard drive.

TAX Wizard

A GEM oriented tax preparation program. Use TAX Wizard, and your tax preparation session will be short and sweet. Values from each form are stored for call-up by other forms needing the information. All data is saved each time you close a form. Additional screen prompts help the user answer tax pertinent questions to help figure out the largest deductions and smallest possible tax obligation.

- Fully interactive.
- Transfer data between forms.
- Automatic form calculations
- Uses tax tables to compare lowest tax rates.
- All supporting tax forms can be submitted to IRS as printed.
- Print in place on 1040 form for submission to IRS.
- IRS copies of all supported forms included in TAX Wizard package.

Forms Covered:
Form 1040
Schedule A
Schedule B
Schedule C
Schedule D
Schedule E
Schedule EIC
Schedule F
Schedule R
Schedule SE
Fomr 2441
Form 3903
Form 4868
Form 8606
Form 8829
Form 2106
Form 4562
Form 1040A
Schedule 1
Schedule 2

Complete Package $49.95

Upgrade Notice: Registered TAX Wizard owners deduct $10 when ordering the 1991 tax year package. Unregistered owners send old registration card with order.

Future forms include 941, W2, 1099, etc.

NeoDesk CLI

Bill Rayl

If you're a user of NeoDesk version 2.05 or higher, you really should get NeoDesk CLI.

A Graphic User Interface (GUI), such as the ST desktop or NeoDesk, is great for most purposes. I wouldn't go back to a standard DOS with command line interface (CLI) if you paid me to do it.

On the other hand, it sure is nice to have a CLI as an option for those times when using a command line is much faster than point and click operations. Another benefit of a good CLI is the ability to use "batch files" to process multiple commands easily.

There are a number of CLI programs available for the ST and a few of them are quite good. If you're a NeoDesk user, though, you have one very excellent CLI that stands out from all the rest—NeoDesk CLI from Gribnif.

Because of its ability to directly use many of NeoDesk's built-in functions, NeoDesk CLI offers more power than any of its competitors. The list of features is quite impressive.

NeoDesk CLI can be run as a NeoDesk Program or NeoDesk Accessory. As a NeoDesk Accessory, you can access the CLI from within any GEM program. You can execute any TOS or TTP programs, and even run GEM-based software. Output from TOS or TTP programs is automatically kept within the CLI window. And, NeoDesk CLI has very extensive Batch file capabilities.

Batch Files

One of the biggest advantages a CLI can offer is Batch file processing. A Batch file is simply a list of commands and/or expressions that are evaluated and executed in a step-by-step process.

Anyone who has ever written a "script" or "DO" file for a terminal program has, in fact, written a Batch file. Batch files are (usually) simple kinds of programs to accomplish a given task.

Using the Variables, Functions, Operators and Commands available in NeoDesk CLI, you can create very complex batch files for almost any need. Loops include IF, FOR, WHILE and REPEAT. You can define up to 2000 different variables and access nearly 40 system variables. These system variables include such things as window size, row/column position of the cursor or mouse, and current input/output device.

A special DEBUG command helps when testing and modifying your Batch files. While DEBUG is ON, NeoDesk CLI echoes each line of the Batch file, followed by its interpretation of the line, complete with line number. If there's an error, you know right away where it occurs.

The 10 sample Batch files included on the NeoDesk CLI disk are very instructive and quite useful, too! The MAKEMENU Batch file, in particular, is very interesting. With it, you can create window-based program-launching custom menus.

History

Another useful feature of a good CLI is its History capability—the ability to recall, edit and re-execute past commands. The History buffer in NeoDesk CLI is configurable up to 64K, and that can hold a huge number of commands!

NeoDesk CLI has the very best History functions I have ever seen in any CLI. It even beats many mainframe computer systems. To scroll through the History buffer one command at a time, simply press the Shift-uparrow or Shift-downarrow combination. Once you find the command you wish to reuse, you can edit it if you wish then re-execute the command by hitting return.

In addition to the Command History, NeoDesk CLI also has a Window History, which is also configurable. This Window History is actually a scroll-back buffer, similar to those found in some terminal packages. You can use the arrow keys or Home key, with or without the Shift key, to move around the Window History buffer. By selecting text with the mouse, you add that text to the current command line. You actually build new commands piece-by-piece using text in the Window History buffer.

Aliases

Aliases are great for creating your own specialized commands, and NeoDesk CLI supports Aliases in a big way. In fact, you have two types of aliases available to you. The first type is the way one would normally think of an alias—as an abbreviation for one or more commands.

For instance, to get a wide directory listing with only filenames from NeoDesk CLI, you must enter LS W+ V- as the command. Or, you could create an alias—something like ALIAS LW "LS W+ V-" creates a new command LW. Now, just enter LW, and NeoDesk CLI does the rest!

If you find yourself using a set of commands often, creating an alias can save you a lot of typing.

The other type of alias is a bit more complicated, but also very useful. You can use the ALIAS command to redefine any key on the keyboard to any string of characters, including carriage returns. This gives you the ability to define macros for different key combinations.

Wildcards

A CLI is probably most used for file manipulations that aren't easily handled by a GUI. A CLI generally does much better at complex file operations because of more flexible wildcarding. A GUI, on the other hand, usually has no wildcarding support for file manipulation or, at best, support only the '*' and '?' wildcards.

NeoDesk CLI, like many good Command Line Interpreters, supports "regular expressions" in wildcarding. These expressions are enclosed in brackets ([/]) for matching individual characters or braces ({/}) for matching elements in a list separated by commas, tabs or spaces.

As an example, entering the command LS CA [BDM].TXT would match files named CAB.TXT, CAC

NeoDesk 3.02

By now, everyone in the ST marketplace should be well aware of NeoDesk from Gribnif Software. NeoDesk is *the* premier desktop replacement. Version 3.02 of this popular desktop adds a number of important features. This article will deal with those new features. *[Ed: For a complete review of NeoDesk 3, see the February 1991 issue of Atari Interface.]*

The biggest changes are in the icon editor. NeoDesk owners can now read any bit images contained within a resource file, not just icons. With this new capability, you can grab a bit image from your favorite program's RSC file and use that to create a custom icon for that program.

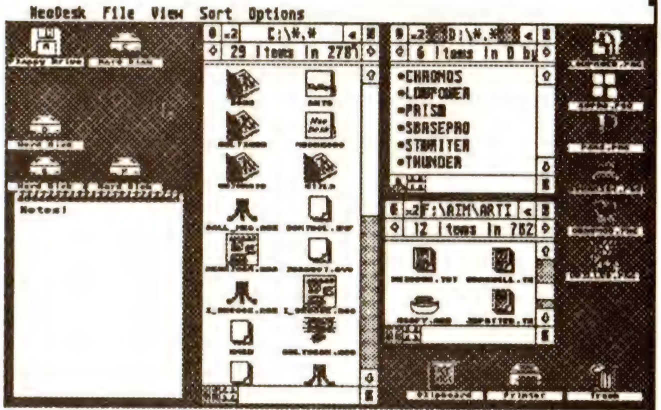
Other enhancements to the icon editor include opening of a new .NIC file window when you select "Create .NIC File..." and addition of a "Save .NIC File" option that makes creating individual .NIC files easier. Also, pressing Control while clicking once on an icon lets you change the icon's template without editing the whole icon.

Some "minor changes" to NeoDesk make it possible to use the Call NeoDesk and Item Chooser NeoDesk Accessories.

Fixes

NeoDesk 3.02 also fixes a number of incompatibilities or minor problems with ZoomRacks, ProText, ProData, CodeKeys, HotSaver, Easy-Draw/OutPrint and Hardcopy (a program that comes with Calamus).

NeoLoad, the program that actually loads (and unloads) NeoDesk, now correctly detects Mega/STE TOS (TOS 2.0x) and TT TOS (TOS 3.0x). NeoDesk functions beautifully in all ST and TT resolutions.



Other "major fixes":

"Show Information" on folders in the Icon Editor no longer causes crashes.

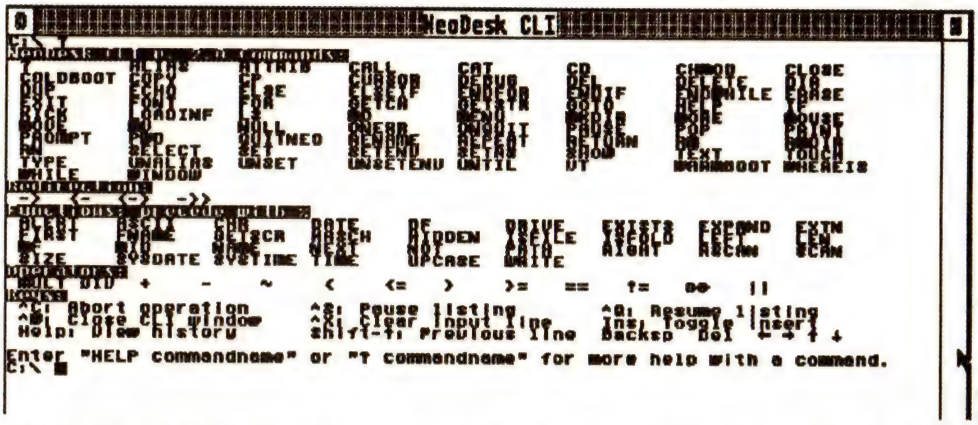
The corner clock works correctly if a Moniterm/Viking monitor is connected without an Atari mono monitor.

A file's "original name" can now be safely renamed during a name conflict.

The printer queue correctly performs form feeds between files, if selected.

The counter of how many files and folders are waiting to be copied is correctly updated when copying into NeoDesk's File Clipboard. NeoDesk now supports hard drive partitions with sector sizes greater than 1024 bytes and partitions larger than 32 megs. MetaDOS devices (CD-ROM drives) and other non-standard GEMDOS driver letters are now handled correctly. Batch files are now correctly treated as Active Icons .

If you have not yet upgraded NeoDesk 3.01 to 3.02, you can get the upgrade disk from Gribnif Software for only $5. Or, send in your NeoDesk 3.01 disk and $5 and the folks at Gribnif will perform the upgrade for you!



```
^C: Abort operation      ^S: Pause listing       ^Q: Resume listing
^W: Close CLI window     ^X: Clear input line    Ins: Toggle insert
Help: View history       Shift-↑: Previous line  Backsp  Del  ← → ↑ ↓
Enter "HELP commandname" or "? commandname" for more help with a command.
C:\
```

.TXT, CAD.TXT or CAM.TXT. Or, if you wanted to search for all executable files or desk accessories starting with the letter 'B', you could issue the command LS B*.{tos ttp pr[gx] app ac[cx]}. This command will match all files starting with 'B' that have extensions of .TOS, .TTP, .PRG, .PRX, .APP, .ACC or .ACX. Pretty powerful stuff.

Conclusions

NeoDesk CLI also comes with a configuration program that lets you modify various buffer sizes and other settings. Included in these settings is the number of variables definable by you, the size of the Window and Command History buffer and the number of bytes available for aliases and batch files.

The NeoDesk CLI manual and version 2.0 Addendum do an excellent job of covering all the features and functions of this program. The user is given numerous useful examples of how to use the various commands, variables and functions.

An ASCII table and list of keyboard scan codes in the back of the manual is a welcome addition. Even though I, and probably most others, have these lists in other reference books, it's nice that they are included here for ease of use.

The section in the 2.0 Addendum called "Improving Batch File Execution Speed" is particularly useful. In it, you are given some very good advice on how to get your batch files zipping right along.

If you're a user of NeoDesk version 2.05 or higher, you really should get NeoDesk CLI. For only $29.95, it adds a whole new dimension to your desktop. NeoDesk CLI gives you the extra flexibility only a CLI can offer whenever you need it, without making you give up the ease of use of your point and click desktop. You really can have your NeoDesk and CLI, too.

NeoDesk Accessory and Icon Disks

Nowadays, $10 doesn't buy much, unless you're an owner of NeoDesk. If you are, the folks at Gribnif Software have some great buys.

The NeoDesk Accessory Disk contains two very powerful NeoDesk Accessories. Call NeoDesk gives you full access to the NeoDesktop from within any GEM program. Item Chooser is a powerful file selector.

Call NeoDesk

While some "disk utility" accessories let you copy or delete a file or format a disk, they usually aren't very flexible. Call NeoDesk makes all the power of NeoDesk available to you from within your favorite word processor, terminal package or other GEM-based software.

You can open directory windows, copy/move multiple files, select items from NeoDesk's drop down menus (which become pull down menus with Call NeoDesk) or anything else you normally do from the desktop, except run another program.

In order to use Call NeoDesk, you must configure NeoDesk to *not* unload before running a program. Because of this, using Call NeoDesk isn't practical on low memory systems. The Call NeoDesk accessory itself only takes up 7K of memory!

Item Chooser

The Item Chooser is really one big dialog box with a lot of options. With it, you can select all files, folders or both files and folders that do or do not meet your search criteria.

Make your Atari FAST!

WARP 16 FAST!

The WARP 16 accelerator + cache board contains a high speed 68000 CPU that replaces the slower 68000 CPU currently used in your Atari.

By taking advantage of the large amount of high speed cache ram on the WARP 16 board this CPU is able to run programs at twice the speed of an unmodified Atari.

Routine tasks such as spellchecking, spreadsheet calculations, screen redrawing, and laser printing take a fraction of the time they used to.

No longer are you frustrated by waiting for your computer.

WARP 16's custom logic allows caching of both reads and writes AND caching of both "byte" and "word" memory accesses.

What does all this mean?

Your Atari moves FAST! WARP 16 FAST!

Features:
- 16MHz CPU accelerator with cache for all Atari ST/MEGA computers.
- 80K of high speed static ram. Organized as 16K cache-tag ram + 64K cache ram.
- FOUR TIMES MORE cache ram than any other Atari accelerator on the market.
- User selectable "stock ST" mode gives 100% compatibility with ALL Atari software. Even Spectrum 512.
- For use with Atari ST, MEGA, and STACY computers.
- STE version available soon.
- Don't settle for other upgrades that offer tiny amounts of cache ram, or offer compatibility with 80% of existing software.
- WARP 16 offers a full 64K cache + 100 percent software compatibility.
- Dealer inquiries welcome.
- Order your WARP 16 TODAY!

WARP 16 $349.95 (U.S.)

Add $4.50 for shipping and handling. Note: WARP 16 requires installation by a qualified computer technician. This installation may be done at your local computer repair shop. Call us for details.

Item Chooser 1.0, by Dan Wilga, Copyright © 1990 Gribnif Software

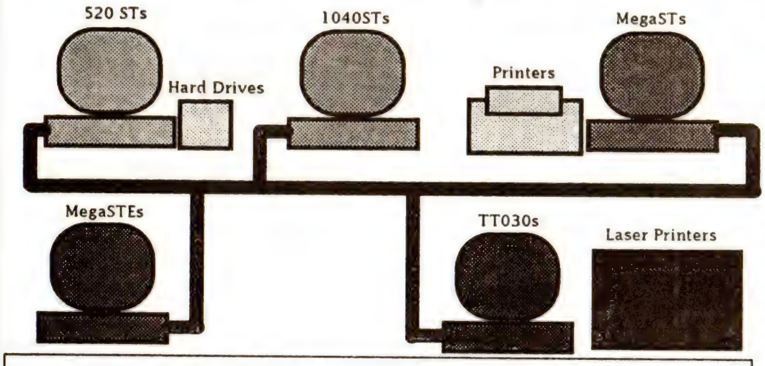
You must have NeoDesk 3 version 3.02 or higher to use these accessories.

NeoDesk Icon Disk

Another great $10 deal is the NeoDesk Icon Disk. This disk contains over 750 different icons for use with NeoDesk. Icons are organized into categories for applications, desk accessories, data files, etc. The icon groups are supplied as .NIC icon files, so finding the icons you want is a breeze.

The NeoDesk Icon Disk is a great way to spruce up your NeoDesktop without spending days in the icon editor creating your own custom icons.

Connectivity..



Universal NETwork

Universal NETwork has been installed in 223 systems since its introduction in April 1991. The software supports CARTridge, MIDI and LAN port use. Device drivers for all models of Atari 16 and 32 bit computers is included in the package. Expand your computer use with networking. Share hard drives, printers, and plotters, works easily between computers. Total TOS compatibility. There is never an interruption of your work while using the network because Universal NETwork equips your system with network multi-tasking. The network operates in the background without disrupting foreground tasks. Easy 9 minute installation gets you "up and running" in no time.Use one or more hard drives or printers in the network. MIDInet and LANnet hardware uses standard 4-wire modular phone technology.

Universal Item Selector III

Now upgrading to Version 3.3

Send $10 with your original disk to A&D Software for the newest version.

CardFile 3

Bill Rayl

I've been impressed with CardFile for a very long time now—long before the Gribnif people added it to their fine lineup. The latest, CardFile 3 version 3.02, has added a number of nice features, including full TT compatibility.

What Is CardFile?

For those of you unfamiliar with the product, CardFile is basically a Rolodex and appointment calendar for your ST. Actually, it's a lot more than that. The manual calls it a "personal information manager."

CardFile can be used either as a desk accessory or as a stand-alone program. Simply rename the file with the proper extension (PRG or ACC) and you're off.

The program is *extremely* easy to use. When you first boot/access the software, CardFile loads in its address book and appointment data files. The CardFile main window then displays the address info for the first card in the left two-thirds of the screen.

The right side of this window contains the Options menu. This menu consists of a number of buttons you can select via the mouse, or you can press the indicated control key sequences.

Entering an address is as simple as clicking on the Edit button, clicking the New button and typing in the text. CardFile has individual fields for First Name, Middle Initial, Last Name, Title/Spouse, Company/Children, Address, City, State, ZIP, Home/Fax Phone, Work Phone, two Notes fields and a Group field.

Once you've entered all your addresses, select the File button and Save the CardFile database. The default file, which is loaded at bootup, is called CARDFILE.DAT. You can, however, create multiple address files and load them at any time.

As of version 3.0, the Card and Group buttons at the bottom of the window are very handy for flipping through your address cards. The Card buttons allow you to move back or forward one card at a time. The Group buttons move you to the next or previous address card of the same Group as the current card.

Groups

The ability to define address cards as belonging to a group is a very nice way of keeping your online Rolodex organized. In the top line of each address card, next to the display of the card's number, you can enter a Group name. In my address book, I have the following Groups: Club, Company, Store, Distrib, Friends and Family.

Rather than dealing with different address files for the various types of addresses you have, using CardFile's Group capability makes it easy. Another good use of the Group field would be to have a Group called Xmas for everyone on your Christmas card list. You can even use CardFile to print the addresses on the card's envelopes. More on the printing features later—there's a lot to talk about there!

Searching

CardFile's search capabilities are also very easy to use. Just above the Group buttons, CardFile displays the currently selected search field. Whenever this field is displayed, CardFile is ready to search.

To change search fields, you simply press the up or down arrow keys. Once you have the proper field displayed, all you need to do is type in the search string and hit Return. CardFile then presents the next card it finds that matches your search criteria. If you wish to continue searching using the same string, press Return again and your search string reappears. Pressing Return once more searches for the next card.

CardFile 3 is an excellent address book with some very useful appointment calendar functions as an added bonus.

At any time, you can press the Home key to move to the first address card in your CardFile database. You can search on any of the CardFile fields. When searching on the Last Name field, CardFile displays the next card in alphabetical order if it can't find an exact match.

Filters

The ability to display cards based on a user-defined filtering process is one of CardFile's nicest features. Like the search capability, filtering can use any field. However, you can use multiple fields for filtering. For instance, you could display only cards in the Company group that are also in the state of California.

In the Options menu for the Card Filter screen, two very important buttons are the Any and Every buttons. You must select one of these buttons to activate the filter. Choosing Every indicates that a card must match every field in the filter to be selected. Selecting Any means that a card need only match any one of the filter fields to be included.

Using our above example, Every would find all companies in the state of California, while Any selects all cards that are either in the Company group *or* in the state of California.

Macros

Another useful feature that can save you some time is CardFile's macro capability. Personally, I use the macros to store my Group names, but you could use them for any text in any field.

CardFile uses F1 to F10 as macro keys. To store text as a macro, you enter the text in a field, then press and hold a Shift key and hit the function key you want to use. That's all there is to it. From then on, just pressing the function key will automatically insert the macro text into whatever field is at your cursor position.

If you wish to keep the same macros from session to session, using the Save CFG option in the Configuration menu defines them, along with many other settings, as your default. You can, of course, change them at any time.

Sending and Dialing

CardFile's biggest strengths lie in its ability to automate some otherwise tedious tasks. The Send option is a prime example. With CardFile installed as a desk accessory, it can automatically transfer address and phone number information directly to your word processor or DTP package.

Here's how it works. You're in your word processor, getting ready to type in a letter. Rather than type that address in by hand, you access the CardFile accessory, find the proper card and click on the Send button. CardFile closes itself and sends the address (and optionally the phone number) from the current card directly into your letter.

Heck, once you've printed out your letter, you can use CardFile to address the envelope. CardFile can't fold and stuff the letter, seal the envelope or lick and apply the stamp, but it does just about everything else!

SHAREWARE & PD

A great PD catalog with great prices!

It's true! Our catalog offers full multi-line descriptions for over 150 double sided disks packed to the brim with the very latest public domain and shareware software—all archived to give you the most for your hard-earned money. Each disk is also protected by a virus guard to eliminate any worry about system problems.

Send $6.00 for your 80+ page catalog and receive a bonus $6.00 coupon for a complimentary first purchase. Our everyday low price is $6.00 per disk.

Call or write today!

P.O. Box 16529
Bear Creek Postal Station,
Surrey B.C. V3W 2P5
Canada
Phone (604)597-5775

OakSprings Software

CardFile also functions as an autodialer, provided you have a modem connected to your computer. You can dial the Home/Fax or Work numbers. You can set the modem to disconnect automatically or just click on the Modem Off button after picking up the receiver.

Three individual dialing prefixes can be set up—one for local calls, one for long distance, and a prefix for special circumstances, like overseas calls. These prefixes, along with a field for your local area code, modem baud rate and more, are all set via the Dialing Configuration menu.

Printing

Whether you wish to print mailing labels, address envelopes, create an address book or generate phone listings, CardFile can handle the job. The Configuration menu allows you to set such things as horizontal and vertical indents and number of lines per page/envelope/label. For labels, you also set the number across as well as the number of labels vertically per sheet.

Once you've customized the configuration for your needs, printing is just a click away. CardFile comes with "printer control files" for Epson compatible and HP Deskjet printers. You can, if needed, create your own printer control file.

One nice touch when printing phone lists or address books is the Chapter option. Selecting Chapter On generates the printout separated alphabetically by starting letter of the Last Name field (or Company field if no last name is present).

Calendar/Agenda

So far, we've only discussed CardFile's ability to keep track of addresses. CardFile also has a rather nice appointment calendar feature. While not as full-featured as some stand-alone calendar program/accessories, CardFile's appointment calendar is quite useful.

The Calendar window displays one month at a time, with the date displayed in the upper left corner of each day's box. If you have any appointments scheduled, the box also shows the total number of appointments for that day, then breaks them into the number of AM and PM appointments.

To select a specific day, you can single click on the box. If you wish to view the appointments scheduled for that day, you can either double click on the day or select the Agenda option.

From the Agenda menu, you have a number of options. You can scroll through the calendar by day, week, month or from appointment to appointment. You can also print your agenda, giving you a daily or weekly "To Do" list.

To enter an appointment, you simply select the Make option, then enter the time (AM, PM or none) and a one-line description.

CardFile can also be set to remind you of upcoming appointments. This feature only works when the program is first run or the accessory is first loaded. It will not, for instance, tell you at 4PM that you have an appointment an hour later unless you booted CardFile up at 4PM. Unfortunately, this is true of nearly all appointment calendar programs.

One thing that is missing from the appointment calendar that I would personally like to see added is the ability to define standing appointments, ones that happen each and every month, settable either by specific date or by day (such as the 2nd Friday of each month). Other than that, I can find little fault with this part of the program.

Miscellaneous

In all, CardFile 3 supports up to 2,500 cards per address book and up to 500 appointments, with up to 12 appointments per day. The program uses about 80K of memory, with an additional 20K (or more if you so desire) for its address cards. The calendar can display any month between 1986 and 2999.

Users of NeoDesk 3 get the added benefit of being able to use CardFile as a NeoDesk Accessory. This allows you to place a CardFile icon directly on the desktop and open the accessory by double-clicking the icon. Plus, you can drag any CardFile address data file to the icon to open CardFile and automatically load that data file.

CardFile 3 is an excellent address book with some very useful appointment calendar functions as an added bonus. When used as a desk accessory, CardFile's ability to interface with your favorite word processor or other GEM-based software is a big plus.

This feature alone makes it well worth the $39.95 retail price.

AIM Mac/Spectre Disk of the Month

Each AIM Mac/Spectre Disk of the Month is a double-sided disk packed with some of the best PD and Shareware programs available each month. The disks are available in either Macintosh or Spectre formats. All files are self-extracting archives. Just double click to extract!

Here is a short description of the files contained on the February '92 Mac/Spectre Disk of the Month:

Blender—Blender DA calculates the minimum number of steps necessary to produce a smooth transition between two colors in a PostScript blend, based on screen frequency, output resolution, and CMYK percentages of the end colors. Perfect for users of Freehand or Illustrator.

Cribbage—Want to play cribbage against the computer? Well, you have to be good to beat Precision Cribbage's Advanced mode. Beginners can get hints and view a histogram of the scoring odds of their card choices. Freeware.

FTF—A working demo of "First Things First," an excellent reminder/to do INIT from Visionary Software. It presents a small floating clock/calendar icon that zooms out to show your reminder lists.

FWPTrans—A shareware translation utility by Malcolm Taylor for converting First Word Plus files (including graphics) and .IMG files from the Atari ST/TT computer into Macintosh formats.

Gravitation 4.0—This educational game allows you to build your own solar system. Lets you explore the interaction of planetary bodies and gravity in a dynamic, visual way. Shareware.

GunShy—GunShy is a version of the popular commercial program Shanghai, a solitaire game played with Mah-Jongg tiles instead of cards. In GunShy, the traditional tiles have been replaced by Mac icons. The game supports color or B&W, and the icons are editable. Freeware.

Learning Stack—This HyperCard stack helps you discover your "learning style." Knowing your learning style can help you be a better student or employee. Teachers and work superintendants/managers can use this stack to better understand and help their students or employees.

QuickB—QuickB DA adds the fast CompuServe QuickB file transfer capability to almost every terminal program. Does both downloads and uploads. If you use CompuServe, QuickB DA is almost certain to save you money.

Scruffy—In this delightful arcade-style game, you play Scruffy the dog. You must get through 10 levels to rescue your girlfriend from the Martians. Don't forget to chomp down on those doggie bones, too! Great sound effects and animation.

SuperCon 1.1a—A conversion program written primarily for SuperPaint, SuperConverter 1.1a has lots of general purpose graphic conversion features. Converts LaserBit, TIFF and ThunderScan documents/graphics to TIFF, EPS, LaserBit or ThunderScan documents/graphics.

Readers can purchase this disk by sending $6 ($5+$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the February '92 Mac/Spectre Disk and which format when ordering.

AIM ST/Mega Disk of the Month

All files on this disk are self-extracting archives created with Double Click's Self-Extracting ARC program DC SEA! Simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the February '92 disk. For more complete docs, see the text files contained in most of these archives.

BAKTRACK.APP— An automatic backup utility for user's of Tracker/ST. Quickly backup those important data files without copying unneeded files. FreeWare courtesy of Step Ahead and WizWorks. Written by Chet Walters.

CAPTHOOK.APP— Captain Hook is a shareware program that allows you to "unhook" resident programs to eliminate interference with other programs. It is especially useful for eliminating conflicts with MIDI programs, but will help with almost any kind of program conflict. Written by John Eidsvoog.

CLPBOARD.APP— The Atari Clipboard Configuration CPX from Software Development Systems lets you manipulate files stored to the Atari Clipboard. View IMG, TXT and .XIC files, plus a few other new features. Freeware. Requires XCONTROL.ACC.

FBIT.APP— Set Fastload bit on executable files, ACCs, hidden or system files, programs and even accessories you have renamed to ACX. Searches all folders on an entire disk or hard drive partition. NOTE: Setting the Fastload bit speeds up program loading under TOS 1.04 or higher.

FFU.APP— Checks to see if your TT or SST board has an MC68882 math co-processor present. If it is, FFU tests its effectiveness.

FPU_TEST.APP— Utilities to test if a MC68881 math co-processor is installed (e.g. on the AD-SpeedST board or the Atari SFP004 Math Coprocessor board). Tests co-processor's effectiveness.

KAOSDESK.APP— KAOSDesk 2.01 is a German desktop replacement with many features. An icon editor and lots of icons are included. The program and all docs are in English.

MSPYDEMO.APP— Demo version of CodeHead's MIDI Spy— the unique MIDI sequencer that records and plays in the background! MIDI Spy is always ready to record— just play a note on your MIDI instrument and MIDI Spy goes into action. It can also play a list of pre-recorded MIDI files while you use your computer for other things.

OUTBURST.APP— Demo of OutBurST, a program that reduces the time it takes PageStream to output to HP LaserJet and Deskjet printers. Printing time for a full page with an HP IIIP and AdSpeed is about 19 seconds compared to 47 seconds with FPPRNT or 300 seconds with TOS 1.4 alone. Demo version good for 3/4 of a page of output. Info for fully functional version included.

PGSCAL92.APP— 1992 Calendar for PageStream 2.1. All twelve months for 1992, using all stock fonts. Next month preview on each page.

SAT402.APP— Satellite tracking program version 4.02. Many options are provided for amateur radio satellite use or in visually observing satellites. Information is included where orbital data can be obtained from. Takes advantage of math co-processor if you have it, but one is not required. ST/Mega/TT compatible.

STDCAT50.APP— STDCat 5.0 disk cataloging program. Lots of new features including ability to catalog hard drives and improved catalog handling. Shareware.

SUPRCARD.APP— Super Card 1.3 is an excellent, flexible database from the UK. Lots of options and plenty of power. Records are held in memory, so the program is very fast. Shareware from B.Ware.

VANTERM4.APP— Version 4.0 of popular Flash-like terminal program VanTerm. Supports XModem, YModem, CompuServe B, Shadow background downloading and more. Latest version of DCOPY utility program included.

ZESTFMT.APP— Disk formatter program done in the ZeST style, but for ST medium resolution. Supports standard and extended formats on single or double sided disks, also verifies. GFA listing included, as well as a listing for the ZeST interface routines converted to medium resolution.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the February '92 ST disk when ordering.

We also have a special February '92 ST Games disk! Here is a short description of the files.

AMMOTRAK.APP— High speed graphic arcade racing game. Drive a rocket sled-type vehicle, Shoot at targets and drive through them to gain speed and fuel Not TT compatible. Color only.

DNGNLORD.APP— DungeonLord is a new PD D&D-type adventure with digitized sounds, excellent graphics and 10 levels to conquer. Color monitor and 1MB of RAM required.

KLATRIX.APP— Klatrix is a UK shareware game that combines the best of Klax and Tetris into one game. If you like either of those popular games, you'll love Klatrix. Color only. Not TT or Mega/STE compatible.

MAHJONGD.APP— Playable demo version of Mah-Jong Solitaire from Cali-Co Superior Software. The first five layouts are included. The complete game has 15 layouts. Runs in ST low resolution. Not TT compatible.

MAZE.APP— Find your way out of the 3-D maze generated by this program. Excellent graphics. Options include use of a compass and an "exit finder" dial. If you really get lost, you can take a peek at the entire maze, including where you are in it. Another great import from Germany. Built-in help is in English. Monochrome only.

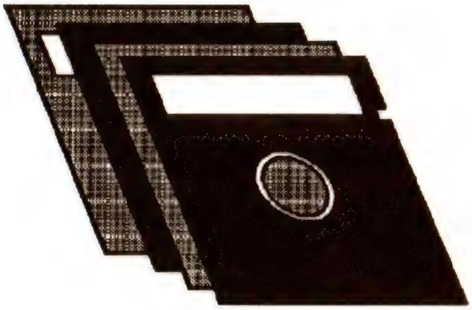
NOIDS100.APP— Latest, possibly final, version of Noids. Includes MKNoids, the game creator. Works best in ST low rez, but also runs in TT medium. MKNoids works in ST low rez only. Shareware.

PUSHBOX.APP— In this mono-only game from Germany you must push boxes to designated areas without boxing yourself in. Multiple play levels. Program is completely in English.

RREPAIRS.APP— This demo of Robot Repairs Inc. from Outland Quest Software lets you play the first level of the game. In this arcade-style game you work in a robot repair shop, fixing problems and squashing bugs against the clock.

This Games disk is *not* part of a normal ST disk subscription. If you are a disk subscriber, the special Games disk must be purchased separately. Please specify the February '92 ST Games disk when ordering.

AIM
Atari Classic (8-bit) Disk
February, 1992



Each AIM 8-bit Disk of the Month is a single-sided, single density "flippy" packed with software. To extract files in the ARC format, you need the UNARC .COM utility. To decompress files with a DCM extension, you need DISKCOM3.UTL. Both programs are available from most BBSes, user groups or you can purchase the April/May '91 AIM 8-bit Disk.

Here's a short description of the files on the February '92 8-bit disk:

SIDE 1

ANSITERM.ARC—ANSITERM 0.2b by Robert Sinclair. A stand-alone IBM terminal emulation program for the Atari 8-bit. Shareware beta version. NOTE: This program should only be used for connecting to ANSI-compatible BBS systems. Because the program is in beta testing, there are some bugs in this software, but ANSI emulation does work.

CARDTRIX.ARC—Maintains a database of recipes, magazine articles, etc. on 3 x 5 index cards. Requires XL/XE and an Epson-compatible printer. Written in BASIC.

BULLET.ARC—Can't get enough of the Coor's Lite theme song? Here's a nice little graphics/music demo to help you get your fix. Don't forget to sing along!

JR1.ARC—JR Games Collection #1! BASIC programs in this ARChive include California Lottery, JR Quest and JR Dots.

MONTANA.ARC—High quality strategy solitaire card game. Features multiple Undo and Redo, Instant Replay, Statistics and more! 100% assembled machine language.

MYJONG.ARC—My Jong by Bruce Fish is a version of the Mah-Jongg solitaire board game written in compiled ACTION. This game provides a 3-D perspective and allows several options to tailor the game difficulty. An excellent adaptation of a very addictive game.

SIDE 2

BROWSER.ARC—A hard drive menu program and a WHOLE lot more. Browser can display picture files, play digitized ASP sounds and much more. Great for cleaning up your HD directories. Very much like the menu programs that run on bigger—but not necessarily better—personal computers. Written by Tom Hunt.

WEDG21.ARC—Latest upgrade of Ed Bachman's superb WEDGE for SpartaDOS 3.2d. Adds 20 very useful commands to SpartaDOS such as PEEK/POKE, DEC/HEX, READ, WHAT (file type), RENDIR (rename dir), VIEW (arc files), PURGE (prompted ERASE), FIND, ez FORMAT (ala SDX), and much more. Hooks to external files in extended memory, plus Resident MIO commands. Requires XE or XL with at least 128K of RAM (*stock* XE will lose ramdisk).

XYMODEM.ARC—Extremely useful program for sysops of BASIC BBSes. Written by Trent Dudley in 1987 (author of Amodem 7.50), the BASIC code in this ARC allows for transfer of files using either XModem or YModem. It can transmit or receive files; the subroutines are in clean machine code and they are FAST. Turn screen off during block I/O for even faster transfers. Easily modified for YModem Batch.

Readers can purchase this disk from the local AIM participating user group or by sending $6 ($5 +$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the Feb. '92 8-bit Disk when ordering.

GEMULATOR

Run your ST software on a PC!

Today, many ST owners use PCs at work and school. While PC emulators do a minimal job of emulating the PC software on their STs at home, they are slow, difficult to install, and can't emulate EGA or VGA graphics. What a waste of time!

As emulation experts we took on the challenge to use the power of PCs to emulate the ST. Remember, in 1987 we wrote the **ST Xformer** Atari 800 and Apple II emulators. Then we emulated the 130XE, created the cable to connect the 810 and 1050 drives to the ST, and wrote full speed TT and PC versions. ST emulation was the next logical step!

Gemulator is our ST emulator. It completely emulates the 68000 processor, and it uses the PC's keyboard, mouse, disk drives, and monitor to emulate the ST's hardware.

While PC emulators for the ST can cost over $400, we'll be introducing **Gemulator** for under $200. That makes the cost of a complete 386 system with emulator about the same as the cost of a complete ST system - with PC compatibility to boot!

System requirements: any DOS compatible PC with 386 or 486 processor, 4 megabytes of RAM, VGA card and monitor, 3.5" floppy disk drive, and a hard disk. A mouse is optional.

If you missed our Gemulator seminar at the Chicago Atarifest, write or call today for our free newsletter!

A Star Returns...

Two special people deserve recognition. The first is my sister, **Sherry**. She has done all the shipping, every night for the last year, despite having a full time job during the day. The second, my friend **Ginger**. She's makes Rising Star shine, she takes most of the orders and keeps it running smoothly. Neither Sherry or Ginger know about their sudden fame, until this ad appears. It's my way of saying thanks and welcome back Ginger.

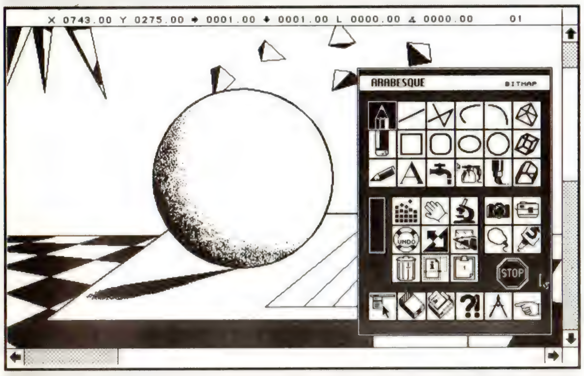
Arabesque™ PROFESSIONAL

Illustration made easy!

***Arabesque Professional* is a complete Bitmap and Vector based illustration program. It allows you to create, import, edit, and save graphics in the two standard computer formats, Bitmap and Vector.**



X 0743.00 Y 0275.00 ◆ 0001.00 ◆ 0001.00 L 0000.00 ∡ 0000.00 01
ARABESQUE

X 0496.00 Y 0195.00 ◆ 0001.00 ◆ 0001.00 L 0000.00 ∡ 0000.00 01
ARABESQUE
VECTOR
UNDO
STOP

Features include:

- Easy to use, icon-driven, pop-up menus.
- Edit up to 20 drawing pages in memory.
- Draw points, lines, Bézier polygons, B-splines, circles, ellipses, arcs, 2D/3D, and rectangles (with or without rounded corners) in Bitmap or Vector mode.
- Choose from various line end styles, thicknesses, drawing modes, etc.
- 108 different fill patterns, edit your own or use an image block.
- Block operations (rectangle or arbitrary shape) including: cut, paste, mirror, rotate, bend, increase contrast, contour, smooth, enlarge, save and load.
- Outputs to 9- and 24-pin dot matrix, "Bubblejet", as well as Atari and HP laser printers.
- All functions operate rapidly in magnification mode.
- A complete UNDO feature.
- Load and save various graphic types including IMG, IFF, Degas, NeoChrome, Doodle, Calamus CVG, GEM/3 and Arabeque's own compressed formats.
- Configurable "spray can" feature.
- Complete selection of drawing modes, including: replace, XOR, AND, transparent, reverse, and more.
- Easily convert Vector graphics to Bitmap graphics, with optional use of gray scales.
- Fully illustrated manual.

Arabesque is also a program with an incredible amount of attention to detail. Its speed will amaze you, while its ease of use will astound you!

Arabesque is compatible with all Atari computers. It supports large display screens, like the Moniterm. Requires at least 1 megabyte of RAM and a monochrome monitor.

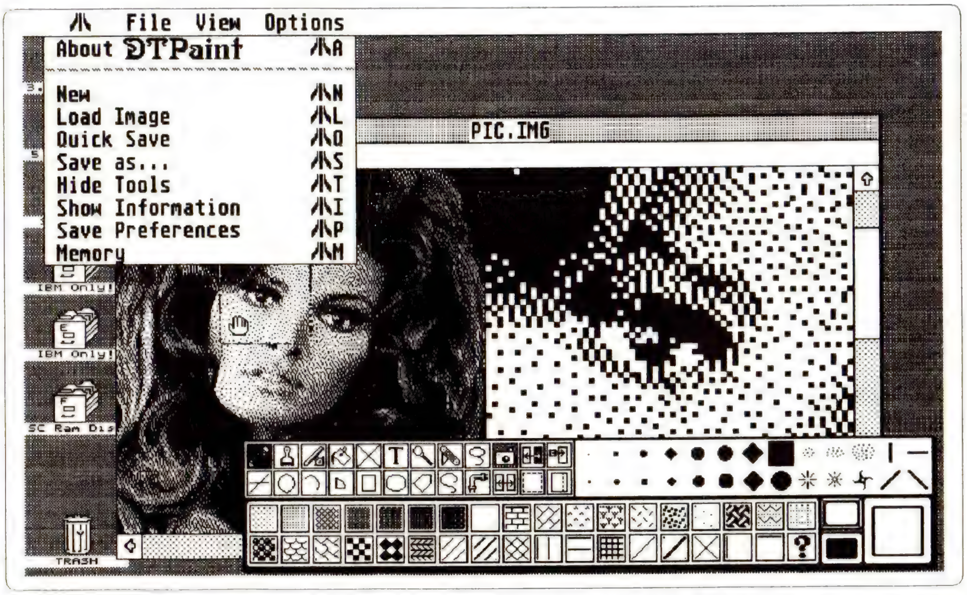
At Last! A Graphic Editor That Runs as a Desk Accessory



DTPaint

New Version 1.5

A POWER PACKED graphic editor that has the tools professionals need to created and edit graphic artwork. "MAC" like features such as *"LASSO"* and *"JACKKNIFE"* that make cutting out pieces of clip art a breeze. DTPaint has all of the basic tools and many advanced tools like; Bezier Curves, Jack Knife, Lasso, Pie, Polygon and more. DTPaint Supports IMG, Degas, Degas Elite, Mac Paint and Monochrome IFF and PCX picture files.

Because DTPaint runs as a Desk Accessory, you can use it while you are running other programs. DTPaint works great with Desk Top Publishing programs like **Calamus, PageStream, Fleet Street Publisher, Timeworks Publisher** and many more. DTPaint will allow you to edit graphic files without leaving your DTP program. If you need a very powerful and easy-to-use graphic editor, DTPaint is for you!

**Requires a Monochrome Monitor*

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs are preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari TT/030, HP Laserjet II with PacificPage PostScript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.

Editorial Ramblings

The focus of this month's issue is Desktop Publishing, one of the areas Atari has recently focused on for increased US support. The other major niche market for Atari is MIDI music. While they had been letting their US inroads in this market deteriorate in the recent past, indications are that Atari is once again moving strongly in the music industry. For details, read the Bulletin Board column in this issue.

Club response to our new format for the club listings has been overwhelmingly positive. This month, we've adopted yet another suggestion from a number of clubs. The clubs are now organized in the back by state, making it easier for readers to find local user groups.

In the next few months, we expect the number of Participating Clubs to break the 100 mark! (We're currently at 94 and many more clubs have recently contacted us.)

We've gotten a few calls from purchasers of recent ST Disks of the Month who have experienced a couple problems with the DCSEA self-extracting archives. First, not all the files contained in some of the archives are being extracted. This seems to occur whenever files of a certain size are encountered. To get past this problem, simply re-extract the files to the same path and answer "n" when asked if you want to overwrite the files already extracted.

The second "problem" is that DCSEA reports that very large files fail CRC check when extracted. The solution to this one is simply to *ignore* this warning. The files are perfectly fine and run without error.

Thanks to the guys at Suzy.B.Software, a PD mail-order firm that also uses DCSEA on their disks, for first bringing the CRC bug to our attention so we were prepared when disk purchasers called us. Suzy.B has already contacted Double Click about the problem, so hopefully a "permanent" solution isn't all that far away.

FEATURE ARTICLES

Right On Target 8
David Plotkin, Contributing Editor, starts out the DTP issue talking about his experiences with hand paste-up and computer aided-DTP.

PageStream 2.1 12
The latest version of Soft-Logik's DTP package for the ST is reviewed by Patricia Snyder-Rayl.

True (DTP) Confessions 18
Ralph Turner, author of the series of books of Atari ST Topics, shares frustrations and successes he's had with desktop publishing.

DTP Building Blocks 22
Editors Bill and Pattie Rayl talk about ST programs and packages that help you with your DTP projects. At the end of the article is a listing of phone numbers to contact the companies.

Running with the Stars 30
Bob Komives (FRAUG) interviews a Lockheed Staff Engineer at the NASA Langley Research Center about NASA's recent purchase of an Atari TT.

Ralph Turner's Third Book of Atari ST Topics 35
Tom Brantmeier and Jerry Belfor each give a separate review of the latest Atari ST help and tips book from Ralph Turner.

DTP Help from Spar Systems 38
CalAssistand and PageAssistant are given a thourough going over by Editor Bill Rayl.

Data Analysis with Your Atari Classic 8-Bit 42
Michael Dalto explains how he uses his Classic Atari to determing variations in experimental data—with source code.

A-T-A-R-I—Software Hacking 46
AFED's Paul Alhart issues a Hacker's Challenge! Software accompanying this article appears on the March 8-bit Disk of the Month.

Qwikforms and Business Forms 47
AIM's Patricia Snyder-Rayl talks about STerling Connection's Qwikforms and Soft-Logik's Business Forms packages for use with PageStream 2.1

SST Status 51
Gadgets by Small's Dave Small rambles on for several pages about the difficulties he encountered while creating the SST 68030 accelerator and memory board.

From The Reader's Viewpoint

Dear AIM:

In response to Jerry Bridgman's article "Shaded 80-Column Fonts," I'd like to answer a couple of his questions.

First, "How is it possible for the XEP-80 to produce a higher resolution mode through the joystick port."

It doesn't matter whether it is through the joystick port, the SIO port, the PBI port or as a mode in the computer. The normal video output only has 320 dots across the screen. The XEP80 *hardware* does 640.

Divide by 80 and you get 8 dots per character, same as the standard 40-column mode. The 8-bit hardware can't generate anything higher, as this would require at least 16K of RAM, the total memory in the early models (and it would need a video oscillator twice the current speed, or 7.16 MHz).

The second reply has to do with saving RAM for a character set under BASIC and running into a screen display problem with Turbo BASIC.

The problem is not with the language, but the hardware. Jerry is trying to open a Graphics 15 mode screen. This takes 8K of RAM for the screen and display list. The Antic processes data to be displayed, but it can only count up to 4,095. This means it can't count over any 4K boundary. A "Load Memory Scan" command must be used to restart Antic at the next 4K boundary.

Since the OS is written to set up the screen on 4K boundaries, dropping the safe RAM by 1K won't work. If someone needs safe RAM when using an 8K screen, they lower RAMTOP(106) by 16 pages (with Atari BASIC, this changes to 144 pages). The 4K space is then used for GR.0 screens, character sets, data and assembly routines. You can even locate Player/Missile graphics data there.

Or, you can set up GR.15, then lower location 106 to 124 and put the font under the Graphics screen at Page 36, all in safe RAM. All of these numbers are different for Turbo BASIC as it loads into low RAM as a program rather than high RAM as a cartridge.

The original 8-bits had two plug-in cards—the Bit 3 (excellent) and the Austin-Franklin (excellent, but it overheated). The XEP-80 is the only full view type I know of for the XL/XE.

When I write software, I generally use multiple screens to get around not having 80 columns. This is usually fine, as the 40-column screens are easy to read and the user is not faced with too much data to sort through.

I use Paperclip for word processing, since it lets me work in a 40-column window on a virtual screen up to 132 characters wide. The preview window lets me scroll around the whole page.

Rick Detlefsen,
Austin ACE

Dear AIM:

Hi! I'm a German exchange student living in the USA for a short period of time (till next July) to improve my English. I'm also a great Atari ST fan and member of a famous German Atari ST Demo Crew (named S.B.F.).

Where I'm coming from, the PC (IBM and compatibles) is becoming the number one computer. The Atari ST and Commodore Amiga are sharing 2nd place, followed by the C-64. In Europe, we have a real ST scene, especially in France, the UK and Germany. Europe is still a very good source for high quality software like games, professional tools and great Public Domain software.

About S.B.F., we are one of more than a hundred groups all over Europe well known for their demos. By demos, I don't mean demos of application programs like 1ST Word Plus or Tempus... we're making demos to show what the Atari ST really can do, without additional hardware. You only need an ST and a color monitor.

Some examples include perfect vertical and horizontal hardware scrolling, 4096 colors at the same time on the screen and 4-channel (stereo) sound like the Amiga!

You ever heard about the Overscan hardware modification which makes it possible to use the full screen of the monitor without the ugly borders? Nowadays, good demos are showing this is possible without expensive hardware.

All this and much more is happening with Assembly language and a very good knowledge of the internals of the ST. We, the S.B.F., are swapping a lot of this demo-stuff and other very good PD software (also made by Demo groups). For example, we have an excellent 4-channel stereo soundtracker and more than 100 disks filled with all kinds of digital music for this soundtracker.

We want to spread this PD software without making a profit because one of our goals is to show other ST users what STs can really do so they stay interested and don't change to other systems. It's really fun to collect these demos. Most of them are pretty good entertainment, because it's an embarrassment for a group to produce a boring or badly made demo.

My big request to all ST owners in the Melbourne, Florida, area is to contact me and help spread this software, because I didn't have the chance to bring my ST to the US. If anyone can help me, I promise you the newest demos and other very good PD software for *free!*

My address is Heiko Rödelsperger, c/o Konig family, 655 Ebony St., Melbourne, FL 32935.

Dear AIM:

I'm a devoted Atari 8-bit user who recently discovered your quality publication through my local user group, SDACE. I was a member of SDACE some years before, but I allowed my membership to lapse when the group began to orient itself to the 16-bit machines.

Late last year, I read an article about SDACE in a local computer magazine which mentioned the existence of your publication and its articles of interest to Atari 8-bit users. I have since rejoined SDACE and am now pleased to receive AIM through my membership. It has helped to fill in the void left by the demise of Analog and Antic magazines.

I am very impressed with your efforts and am writing to inquire as to the availability of back issues. I am interested in obtaining back issues because I feel AIM will be a worthwhile addition to my collection. If back issues are available, please give me any information I need to order them, such as price and issues available. Thank you.

Jim Thompson
San Diego, CA

[Eds: Jim—We're pleased that you like the magazine and that we helped reunite you with your local user group. As for back issues, we do have some, but not all of our past issues are available. We're (slowly) putting together an inventory of what is available (including Michigan Atari Magazine issues back to December 1987). Along with this, we are doing an index of all articles appearing in those issues. As soon as these monumental tasks are completed, we will be sending these lists to you (and others who have requested it). Then, you can order back issues from us for what is available or xerox copies of articles in magazines not on the back issue list.]

Dear AIM:

I have just finished reading my first copy of Atari Interface. As one who will probably never go beyond an 8-bit computer, I was pleased to see the large amount of space devoted to the classic Atari. My only objection is that most of the information concerns games and expansion.

Many times I have visited offices and looked at an expensive computer system with the cursor winking at the operator. If I ask what the machine will do, they usually show me one program that they punch up and tell me how they use it. Beyond that, they know nothing about the use of the machine.

I purchased my 800XL because when I visited a user group, I found that several members were using their equipment to run a business.

I have adapted my equipment for use in running several small water systems. There are several thousand of these systems in operation that should be using the same computer system. I have made several presentations to this effect, but no one has ever followed up on the leads I gave them.

I would like to see Atari Interface publish reports by individuals who are using the Classic for business.

My Classic contains two XF551 drives. I have obtained SpartaDOS X and several other DOS programs to use these drives, but to date, none of them have worked to my satisfaction. Can anyone suggest a DOS that is as simple to use as 2.5 that can be used with the double sided capability of the XF551?

Harry Wolferth

[Eds: If you're looking for a menu-based DOS fully compatible with DOS 2.5, MyDOS is an excellent choice. It's available on the online services and many BBS systems or user groups. The author is Bob Puff, president of CSS, and you can contact him directly at (716) 586-5545.

ATTENTION 8-BIT USERS!!!

Do you bemoan the loss of *ANTIC* and *ANALOG?* Do you wish there were still an *8-Bit only* magazine just for the "classic" Atari 800/XL/XE machines? Are you depressed about the decline of 8-bit coverage in *CN, AIM* and *Explorer?* Would you be willing to pay $25/yr for an 8-bit magazine if it were available?

A dedicated band of 8-bit enthusiasts is exploring the possibilities and *invites* you to participate!

ATARI BULLETIN BOARD

Greg Pratt, President of Atari's Computer division, resigned in January from his position at Atari to join up with Creative Labs, maker of the Sound Blaster card for PC systems. Don Mandell, VP of Sales, has taken over most of Pratt's responsibilities. According to sources at Atari, Pratt's leaving should in no way adversely affect Atari's current growth efforts.

Atari has officially announced the signing of a deal with the General Electric Service Center network. Through this agreement, Atari owners will be able to have their computers repaired at GE Service Centers across the US and Canada. Product service programs are currently being developed jointly by Atari and GE and are expected to go in effect sometime in March. The program will service MIDI musicians and dealers, as well as provide for mail-in service with 1-day or 10-day turnarounds. There are 250 GE service centers in the US and Canada.

TOS and 1.44MB Drives

Bill Rehbock announced that Atari is making all of the released TOS development information available for purchase by the general public. "We are making the kit available to fulfill the needs of programmers who already have purchased a third-party development package, Atari owners who are curious about the 'nuts and bolts' of the operating system, and anyone else who wants to have a detailed understanding of TOS software development," Rehbock said.

Users can purchase the entire documentation package for $150. This includes one year of technical support from Atari via the private Atari Developer RoundTable on GEnie (online time costs not included), six issues of the bi-monthly developer newsletter ATARI.RSC and one year of ongoing developer kit upgrades. If you wish to renew after one year, the fee is only $40.

For information on only certain aspects of Atari TOS computers, Atari is also selling sections of the documentation separately. Everything from back issues of the developer newsletter (since 1985) to release notes for the new STBook is available. For more information, contact Gail Bacani at Atari Corp., 1196 Borregas Avenue, Sunnyvale, CA 94086, phone: (408) 745-2022.

TOS 2.06 chips are now shipping and dealers should have them by the time you read this. For Mega/STE owners, the upgrade is as simple as taking the old TOS chips out and popping in the new ones. A few STE owners may have a slightly more complicated installation.

Atari's Bill Rehbock said,"These are 32-pin EPROM packages. There are some STEs with 28-pin masked ROMs that are either soldered in or in 28-pin sockets that will have to be removed and 32-pin sockets [must be] installed. I am giving advanced notice to dealers and users so that people aren't surprised when they open up their STE to 'pop the chips in.' A very good percentage of STEs in the field have the 32-pin EPROMs, and it will be just a swap. When going from the 28-pin package to the 32-pin package, there are solder pads that need to be altered. Instructions will ship with the ROMs."

Retail pricing on the two chip set is $60. (Owners of ST and Mega computers who wish to upgrade to TOS 2.06 should contact CodeHead Software to purchase their TEC board. Call them at 213-386-5735 for details.)

High density (1.44 meg) floppy drive kits are also now shipping from Atari for MegaSTE and TT owners! The pricing is $139 for the MegaSTE and $149 for the TT. The kits include 1.44MB floppy drive, Atari's AJAX high density controller and the corresponding TOS, either 2.06 for Mega/STEs or 3.06 for TTs. For more details on the TOS or disk drive upgrades, contact your local Atari dealer.

Atari Music

Atari announced at the NAMM show that it has formed a new business division, called Atari Music. This division is headed by James Grunke and indicates Atari's serious commitment to building a better relationship with MIDI developers and retailers. Public relations for Atari Music is being handled by D.K. Sweet.

James Grunke stated, "This division consists of a cooperative group of dealers, developers and sales representatives. The function of this group will be marketing, sales and development support. The first salvo we're firing is the FOSTEX Co-op ad. This co-op ad combines C-Lab, Dr.T's and Steinberg/Jones along with FOSTEX and Atari in a major advertising, Public Relations and sales effort."

FOSTEX Support

The deal with FOSTEX is an important one which breaks new ground for Atari in the MIDI industry. Using FOSTEX multi-track recorders, Atari computers can now be used—via sequencing programs—to control all the recorders functions from *within* the sequencing environment.

Steinberg has upgraded its CUBASE sequencing software to use the remote control capabilities of FOSTEX's G16 and G24 multi-track recorders. CUBASE now can control not only the basic G16/G24 tape functions like play, start, record, fast-forward and rewind, but you can also auto-locate to any position, program punch-in and punch-out markers, strip SMPTE to tape and put tracks in and out of record.

Not to be outdone, C-LAB Software announced integration between Notator/Creator 3.1 and the new FOSTEX machines. Notator/Creator, with over 60,000 users worldwide, is available exclusively for the Atari series of coputers, and provides integrated realtime sequencing and notation capabilities. With version 3.1, the analog recording of vocals, guitars, bass and more become controllable via the digital world of realtime MIDI sequencing. Once connected, the user need never touch the FOSTEX recorder again, except to change a reel of tape.

C-LAB Software is distributed in the US by Ensoniq Corp. For more information, contact them at 155 Great Valley Parkway, Malvern, PA 19355 (215) 647-3930. Steinburg/Jones is at 17700 Raymer, Suite 1001, Northridge, CA 91325, phone: (818) 993-4091.

Also announced at NAMM was the formation of the Music Developer Council, apparently to combine efforts with marketing and development directions.

James Grunke added, "Another major, significant development is Mike Groh's organization of a National Sales Force. This will be a major benefit to all the Atari Community. Many of the reps have extensive music and pro audio backgrounds. And we're looking to cross pollinate DTP and other markets within the music channels."

Calamus SL

ISD Marketing has announced the release of Calamus SL. SL marks the transformation of Calamus from a desktop publishing program to a DTP environment. With its new modular design, Calamus puts you in the center of an ever-expanding universe of DTP tools.

The modular concept means you can purchase exactly what you need today, with the knowledge that additional modules are available when and if you require them.

The basic Calamus SL package contains a new 600-page manual and eight standard modules. For a limited time, ISD Marketing is bundling the PKS Write wordprocessor module and Raster Generator graphics module with the package. Additionally, ISD will throw in two AGFA Compugraphic font families—CG Times and CG Triumvirate (or equivalent if you already own those).

Available for separate purchase are the Speed Line (auto-tracer), Color Separation and Vector Graphic Editor modules. Speed Line brings monochrome autotracing to Calamus, converting raster images into vector graphics and costs $49.95. The Color Separation module supports CYMK, CMY and IHS color separation, as well as the ability to support new models such as Pantone, HKS and Truecolor, once available. This module costs $49.95. The Vector Graphic Editor module allows creation and editing of monochrome or color vector graphics, editing of polylines for irregular text flow and more and costs $99.95.

Calamus SL has a retail price of $795. Registered Calamus 1.09N owners can upgrade for $200. For more information, contact ISD Marketing, 2800 John Street Unit # 15, Markham, Ontario Canada L3R 0E2, phone: (416) 479-1880.

Crazy Dots

Gribnif Software has announced they will soon be selling the "Crazy Dots" video display adapter, developed by TKR in Germany, for the Atari Mega ST, MegaSTE, and TT. The card supports resolutions up to 1,664x1,200 pixels, and can display up to 256 different colors (from a palette of 16.7 million colors) or gray levels at once. A variety of VGA and Multi-sync monitors can be used with the adapter. A "Video Application Slot" allows for future expansion options such as Genlocking and Truecolor display.

Crazy Dots is available in two models. The Megabus model is designed to fit into the original MegaST computers and costs $949. The VME model for MegaSTE and TT computers is available for $999. Gribnif Software, PO Box 350, Hadley, MA 01035, phone: (413) 584-7887.

New Taylor Ridge Book

Taylor Ridge Books has announced release of The ST Assembly Language Workshop, Volume 1. The book is a novice's guide to assembly language programming on the Atari ST line of computers and is written by Clayton Walnum, author of C-manship Complete.

The 260-page book covers the basics of assembly language programming, programming style and technique, a complete 68000 instruction reference and more. Volume 2, scheduled for release later this year, will cover GEM programming and Volume 3 will tackle various advanced topics.

The ST Assembly Language Workshop, Volume 1 comes with a disk containing all sample programs and assorted additional files. It is priced at $24.95, plus $3 shipping and handling. Taylor Ridge Books, PO Box 48, Manchester, CT 06040, phone: (203) 643-9673.

CorCom Folds

CorCom Software Products, producer of Abbreviator ST, has closed their doors. Rather than let a good product die unsupported, Kyle Cordes has turned marketing of Abbreviator ST over to It's All Relative. IAR is the producer of It's All Relative, a popular geneology program for the ST. IAR, 2233 Keeven Lane, Florissant, MO 63031.

ST Informer Split

Most of the ST Informer staff has left the magazine to create a new publication, called Atari Advantage. Apparently, the dispute was over who actually owned ST Informer. Brian Gockley, of Computers Etc. in Connecticut, has replaced Mike Lindsay as ST Informer's Editor-in-Chief. The first issue of ST Informer with the new staff has already been released. Informer has changed to standard magazine format rather than its old tabloid newspaper format, but is still printed on newsprint (similar to AtariUser).

As for Mike Lindsay and the other former Informers, Atari Advantage is scheduled to go to press on Feb. 15th. Atari Advantage is offering a free sample copy to anyone who writes them at Atari Advantage Magazine, P.O. Box 803, Merlin, OR 97532. Subscription rates to Atari Advantage are $22. Call (503) 476-3578 for details.

Right on Target

David Plotkin
Contributing Editor

As with anything else, you need to learn how to be an effective desktop publisher. This takes training and practice.

When I was a teenager in the 1970's, I was a member of an Explorer Post in Monterey, California. For those of you who aren't aware of it, the Explorers are part of the Boy Scouts of America. They are older scouts interested in directing their efforts at some special skill or specialty. In the case of Explorer Post 70, the specialty was photography.

To raise money, each summer "Photopost" 70 did a yearbook for the local Boy Scout camp where I taught survival skills and archery. We would get pictures of the various activities around camp and group shots of all the Boy Scout troops who came up to stay a week at the camp. We took orders all through the summer from the scouts. Several weeks after the end of the summer camping season, we would mail out the yearbooks to our customers.

Those weeks between the end of camping season and the mailing out of the yearbooks were extremely busy, as we put together the yearbooks and got them printed. Since I was one of the officers of the Post, a lot of that work fell to me. It was my first exposure to publishing, and it wasn't a whole lot of fun.

Not only did we have to develop and print hundreds of pictures, but we had to borrow time at a printshop to use their light-tables. These are large translucent sheets of glass with a light behind them. It was on these tables that we did our paste-up. We would laboriously type out the text in columns, then arrange it on the page and paste it in place.

Of course, sometimes we "missed" when we set up the column widths and would then have to retype the text in narrower or wider columns. Once this was all done, we had to paste everything together, page after laborious page.

The whole process was time-consuming and tedious. I remember wondering at the time whether it was worth it—there must be an easier way to earn money! Selling candy, maybe.

Obviously all this took place before the advent of personal computers. The phrase "desktop publishing" came about to describe the process wherein almost everything that had formerly been done by hand could now be done by computer. Desktop publishing allowed the computer to do the tedious and laborious (there's that word again) parts of the layout, while you concentrate on the creative portions. Changing a layout, narrowing a column, moving a chunk of text from here to there became a matter of point-and-click.

People who have come on the publishing scene since the early 80's take this sort of thing almost for granted—those of us who tried publishing prior to "desktop" publishing know just what an incredible boon computers are.

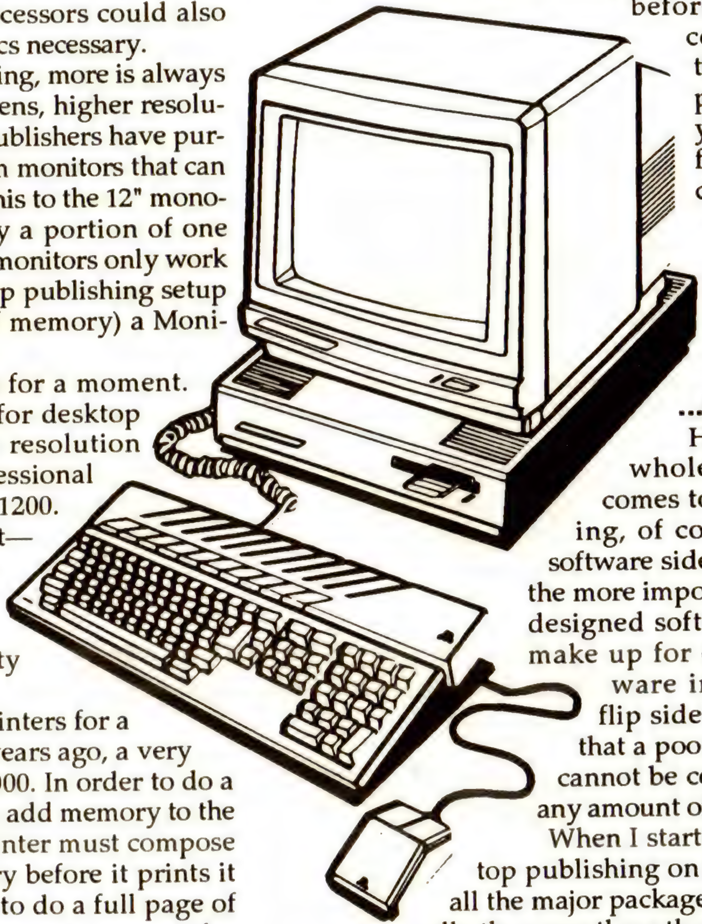
Hardware...

As with many other tasks that have been computerized, desktop publishing has proceeded through a number of phases, and we are by no means done yet. The phases could, in large part, be measured by the power of affordable computers and the capabilities of affordable printers.

With the early 8-bit computers, such as the Atari 400/800/XL/XE series, desktop publishing was pretty limited. You could select some fonts and lay out single pages for posters and cards, but multiple columns and other sophisticated effects were out of reach. Software such as Typesetter, Pagemaker and The PrintShop were available to do page layout.

The next big phase came about when computers took the big jump from 8-bit processors (such as the 800's 6502) to 16-bit processors (such as the ST's 68000). Not only did the processing power of these new machines allow for the massive calculations necessary to handle things such as graphics and multiple columns, but the new processors also could address much more memory.

Desktop publishing requires large amounts of memory to hold the information and display it on the screen looking as closely as possible to the way it will print out. The more powerful processors could also handle the higher resolution graphics necessary.



Of course, with desktop publishing, more is always better—more memory, bigger screens, higher resolution, more fonts. Serious desktop publishers have purchased the bulk of the 19" Moniterm monitors that can show two pages at once. Contrast this to the 12" monochrome monitor, that shows only a portion of one page at any given time. Moniterm monitors only work with Megas, so a typical ST desktop publishing setup consists of a Mega (with 4 meg of memory) a Moniterm monitor, and a laser printer.

Let's talk about laser printers for a moment. Lasers are really the *only* choice for desktop publishing. Their 300 dots/inch resolution looks almost as good as the professional typesetters such as the Linotronic 1200. They are also generally pretty fast—though they slow down considerably when you add graphics to a page. However, they are faster, quieter and of higher quality than dot matrix printers.

The real problem with laser printers for a long time was their cost. Several years ago, a very basic laser printer cost around $2000. In order to do a lot of graphics, though, you had to add memory to the printer. This is because a laser printer must compose the entire page in its own memory before it prints it out. About 2.5 megs is necessary to do a full page of graphics at 300 dots/inch. The laser printer must also have its own microprocessor. This cost put a real laser out of the reach of most Atari desktop publishers.

Then Atari came along and announced a "low cost" laser printer. They got the cost down by using the microprocessor and memory in the ST instead of duplicating these items in the printer.

As with most of the rest of Atari engineering, they got it *almost* right. The problem was that, with this design, the Atari laser printers can work only with Atari computers. Then, there was the nonsense that the laser printer had to be on all the time, even when you weren't using it. And, of course, they could only work with Megas with lots of memory, of which there weren't that many around at the time.

At any rate, there was a lengthy delay between announcement and delivery of the laser printer—just long enough for the cost of other laser printers to come way down. This occurred because of a number of manufacturing advances that lowered the production costs of these printers as well as the fact that both memory and microprocessor costs took a sudden nosedive.

Today, you can buy a fully equipped 8ppm laser printer for under $1000. The HP DeskJet (quiet, 300 dots/inch, but slower than a laser) sells on the street for $399. The advantage of an HP laser over an Atari is the fact that you can hook other computers up to it and it works with 1 and 2 meg Ataris.

It also frees up your computer to continue working before the printing is complete because the printer does the page set up outside your ST. Drivers for HP and HP compatible lasers are available for all ST Desktop publishing packages available today.

...and Software

Hardware is not the whole picture when it comes to desktop publishing, of course. In fact, the software side of things is by far the more important. An elegantly designed software package can make up for quite a few hardware inadequacies. The flip side of this, though, is that a poor software package cannot be compensated for by any amount of hardware!

When I started out doing desktop publishing on the ST, I looked at all the major packages. There were basically the same three then as there are now: Timeworks Publisher ST, Soft-Logik's PageStream and Calamus. My choice was Publisher ST—it combined an ease of use that Calamus lacked with a stability (no crashes) that PageStream couldn't touch.

But, where Publisher ST has been unchanged in the years it has been available, the developers of Calamus and PageStream have continued to improve their packages, adding features, fonts, graphics, etc. Both are now powerhouse packages. PageStream in particular has advanced to the point that there are things that are impossible or difficult to do with other packages (including Mac and PC packages) that PageStream handles with ease. I will not go into the details here (this is covered very well in other places in this issue of AIM), but it is this software excellence that has brought the ST to the forefront of desktop publishing and kept it there.

Other Considerations

As the ST and its more capable brother, the TT, have matured, there has been a general advance in the level of power present in the desktop publishing community. No longer is the "normal" computer a 520 or 1040. Two meg and 4 meg (and bigger, with the TT) machines abound. So, too, do accelerators, with the new 68030 accelerators starting to take a real foothold. What this advancing level of power has done is make it more reasonable to write and market software that requires the extra power.

Examples of this abound. The new scanner software makes it possible to bring in graphics for use in your publications. But the hardware and software necessary to handle 300 dots/inch greyscale graphics (such as photos) is considerable. Another example is Migraph's OCR (optical character recognition) software that requires 2 meg just to work. OCR software takes scanned images of text (which is just graphics to the computer) and attempts to convert those graphics into actual ASCII text. Over the last few years OCR has gotten better and better, and the price has come down to be within reach of the average desktop publisher. OCR is a boon to people who need to bring in blocks of text where the only version is a paper copy.

Some of the new graphics manipulation software that is being imported from Europe lets you convert between graphics format (such as bit images to vector) as well as do sophisticated drawings. CodeHead's Avant Vector is a good example of this. Again, significant amounts of memory are needed, and it doesn't hurt to have a fast processor either. As I said earlier, however, these commodities have become less and less rare in the ST community at large, and in the desktop publishing community in particular.

I have one last thought to leave you with before turning you loose. There is a critical piece that goes with desktop publishing that has nothing to do with either hardware or software. That piece is expertise—"knowhow."

Don't be under the impression that you can become an expert desktop publisher by buying the hardware and software. You can't. In fact, you may have seen the work of people who erroneously believed this to be true. As with anything else, you need to learn how to be an effective desktop publisher. This takes training and practice. The computer—whether an ST or another one—is just a tool to automate the difficult and tedious parts of the job. It is no more a substitute for knowing what you are doing than having a word processor is a substitute for being a good writer.

See you next month!

Has your Atari read any good books lately?

Introducing Migraph OCR

With Migraph OCR and a scanner, you can now give your Atari all kinds of interesting reading material — typeset articles, laser-printed reports, even NLQ dot-matrix-printed manuals — without retyping the originals.

The story you've been waiting for.

Our professional-quality optical character recognition software lets you turn scanned IMG & TIFF documents into editable ASCII text files, ready for export to your favorite desktop publishing and word processing programs.

Great plot, memorable characters, nonstop action.

Omnifont technology — the leading edge in OCR processing — gives Migraph OCR the power to recognize text quickly and accurately.

It automatically recognizes more than 20 popular typefaces, including Courier, Helvetica, and Times. And you can easily train our smart software to recognize — and always remember — other typefaces, numbers, symbols, and special character sets.

Unusual, defaced, and questionable characters won't slow you down.

Migraph OCR uses context-sensitive lexicons (for English, French, Dutch, and German) to make intelligent, time-saving decisions as it processes your text.

Teach your Atari to read today.

Please see your dealer today — or call our toll-free hotline — for all the dramatic details. Ask for the story of the Migraph Hand Scanner and Scanning Tray, too.

Migraph OCR. The desktop publisher's favorite reader.

PageStream 2.1

Patricia Snyder-Rayl

An issue about DeskTop Publishing (DTP) wouldn't be complete without an article about a DTP package. This article deals with Soft-Logik's PageStream. While ISD Marketing's Calamus SL is now shipping, we have not yet received it. Hopefully, there will be a review of Calamus SL in a month or two.

As old Atari ST owners know, Soft-Logik's DTP program was originally called Publishing Partner. As clunkly as Publishing Partner looks today compared to PageStream, it was a revolutionary package. Bill and I cut our "DTP teeth" and first started publishing Michigan Atari Magazine (the precursor to the magazine you're now reading) with it.

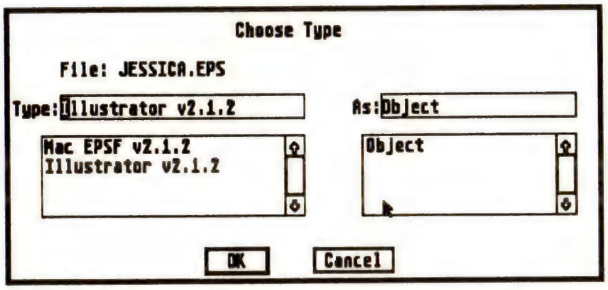
PageStream has come a long way from Publishing Partner! PageStream 2.1 allows users to print PostScript fonts and clip art to non-PostScript printers, use Adobe Type 1 and Compugraphic fonts, bleed objects off the page and a whole lot more!

PostScript Fonts and Clip Art

The biggest improvement over PageStream 1.8 is the addition of Type 1 and Compugraphic fonts. This means Atari owners can now choose from literally thousands of IBM and Macintosh PostScript fonts. There are hundreds of sources for both commercial and public domain/shareware Adobe Type 1 fonts—available on CD ROMs, removable media and floppy disks, not to mention online services. (As an aside, when Atari releases MetaDOS, anyone with a true SCSI port, whether on a TT or ICD host adaptor, can use Mac High Sierra CD ROMs full of EPS clip art and PostScript fonts.)

Additionally, Soft-Logik has given users the ability to print those PostScript fonts and EPS (Encapsulated PostScript) clip art to ANY printer. No more need to run UltraScript with an Atari laser printer to use those great fonts and clip art. Any Hewlett Packard DeskJet or LaserJet, as well as 24-pin or 9-pin printer, can print quality "PostScript" output through the new version of PageStream.

Older versions of PageStream imported EPS clip art, but PageStream 2.1 has gone one better by allowing editing of Adobe Illustrator EPS! This means vector graphics created or compatible with Illustrator can be colorized and taken apart piece by piece.



File: JESSICA.EPS

Type: Illustrator v2.1.2

As: Object

In fact, this was how the EPS clip art on this issue's cover was colorized. The brick pattern was ungrouped, and then the brick rectangles were colored in our specific shade of reddish brown. This process was repeated with the Mega ST system and the DTP tools, using various colors from the PageStream color palette. These were all originally black and white graphics, but PageStream 2.1 and its Illustrator import module allowed us to change that.

Color Definition

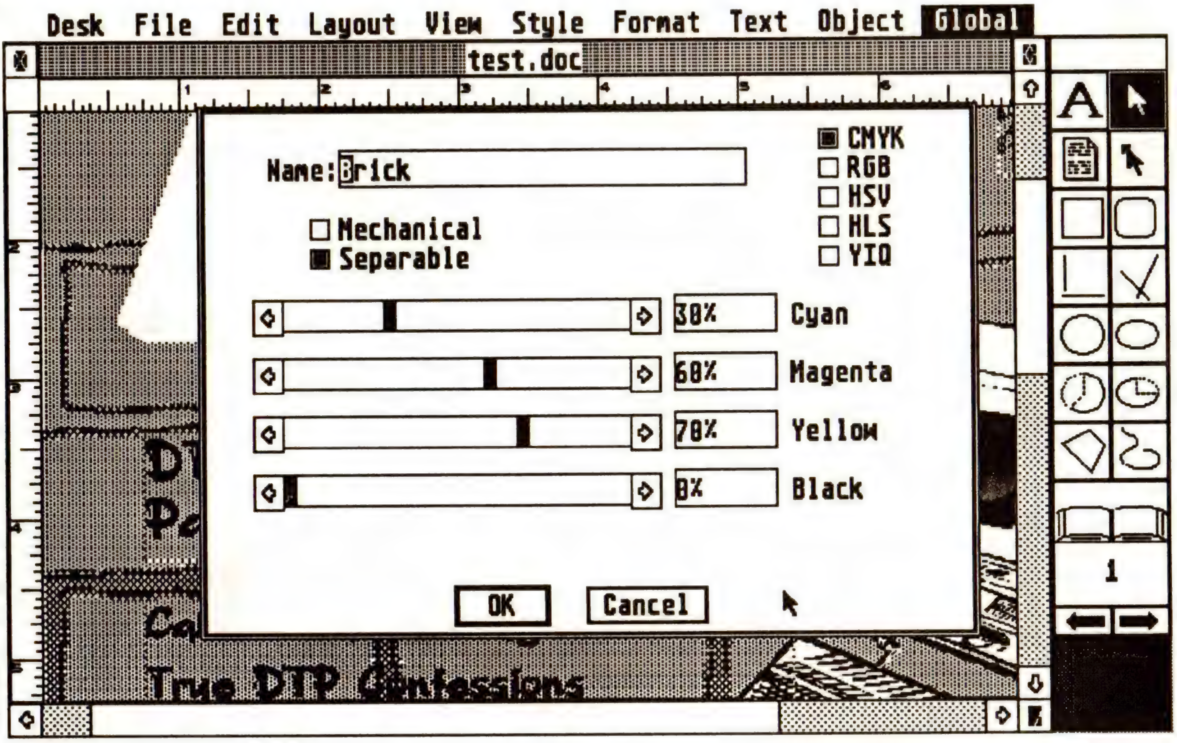
By our specific color shade, I mean our own color! That's another feature of PageStream. PageStream ships with a palette of 14 pre-defined colors and an additional palette of 64 colors based on the Crayola crayons colors is available (We'll include it on this month's ST Disk).

Using the Edit Color Palette feature, you can create your own colors. We use a book called Computer Color: 10,000 Computer-Generated Process Colors (by Michael and Pat Rogondino) to add colors to the PageStream palette. The book then gives the CMYK (Cyan, Magenta, Yellow and Black) values that combine to create the chosen color.

The ability to define colors by CMYK percentages is an important addition to PageStream. This allows you to not only use standard books such as the one mentioned above, but also to create Pantone colors. The Pantone Matching System (PMS) is the standard color matching system used by printers for "spot color" or "adornment color."

There are two ways to get Pantone colors into your PageStream color palette. First, Pantone color charts/books are available through many sources. Most graphics supply stores, and many mainstream bookstores, carry them. These charts give you the Pantone color number along with the CMYK percentages. Using the percentages, you can manually add these colors to PageStream.

The other, and far simpler, alternative is to load an

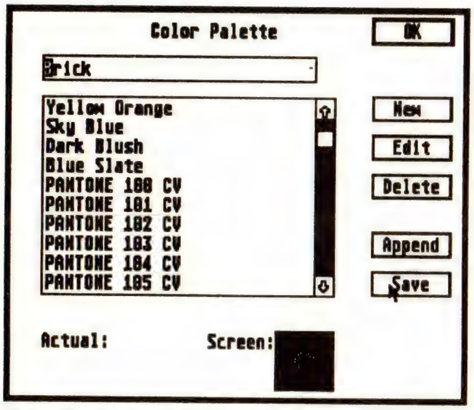


Name: Brick

■ CMYK
☐ RGB
☐ HSV
☐ HLS
☐ YIQ

☐ Mechanical
■ Separable

30% Cyan
60% Magenta
70% Yellow
0% Black



EPS graphic that already contains the Pantone color definitions. While the PageStream manual details the process of saving these Pantone colors to you new palette, PageStream does not come with such a graphic. This month's ST Disk contains an EPS graphic with all 700+ Pantone colors pre-defined. You will still want to pick up a Pantone color chart—at a cost of around $45—in order to effectively use these colors.

Graphics

In addition to EPS clip art, PageStream allows import of GEM, IMG, PCX (IBM picture format), GIF, TIFF (standard for scanning) and MacPaint, as well as ProDraw Clip, AEgis, IFF and IFF DR2D (Amiga picture formats). This really gives a lot of variety. And, even though you can't see the colors displayed on the screen in the bitmap formats, PageStream accepts 24-bit color graphics in the formats listed above that support it.

Bleeding

Because PageStream 2.1 now allows you to set up a "bleed workspace," graphics and text can now be placed so they extend past the edge of the printed page (called bleeding).

The average PageStream owner probably doesn't have a lot of use for bleeding, but we use it a lot when working on the covers of AIM and it's very important for anyone doing professional DTP work.

Again, this feature was important in layout of the background on the cover this month. The graphic—from Soft-Logik's Volume 18 (Backgrounds) in their Image Club clip art library—was enlarged to the point where it overran the edges of the page on the left and right side. In older versions of PageStream, this would have been impossible to do.

One unexpected benefit we got from defining this bleed area is easier detection of spurious "empty text objects." These are just empty text cursors that appear on the page somehow—most likely from trying to move the right GEM window bar up or down when viewing the document page.

I've noticed PageStream has trouble knowing when I've gone over the right edge of the window to the scroll bar. So much so, that I've taken to changing to the object (arrow) pointer when moving the window around the page instead of staying in text pointer mode.

If I stay in text mode and click on the scroll bar, PageStream sometimes thinks I'm still in the page window. So, it creates a text object *under* the scroll bar, in the bleed area. While these generally don't cause any problems, cleaning them up is now fairly easy.

Other New Features

Another new feature of 2.1 is the ability to create Bezier curves. This option gives you nice, smooth curves. This is particularly useful for making text run around circular bitmap objects or in creating artwork in PageStream.

Also, you can now create pages up to 1200x1200 feet. I haven't actually done that, mostly because our laser printer doesn't have a paper tray that size! Actually, this feature would be used in conjunction with PageStream's Tiling option to create posters, signs or even billboards. The Soft-Logik poster of Image Club fonts/clip art is 17x22 in size and is an excellent example of can be done.

Lastly, a new feature to PageStream 2.1 that I haven't used is the ability to make templates. These work almost the same as documents and are a great help if you regularly use the same exact layout. Once you make a template, you don't have to recreate all the work.

For example, if you want to make a letterhead, you could lay out the company logo and address and any other pertinent information, including text columns. Then you could save the document as a template. Later, you (or anyone else) would load in the template as you would a document, and start writing the letter or whatever on the letterhead. The template is loaded in as an untitled document, so it can never be accidentally overwritten.

This template feature could be very useful for any type of standard forms layouts such as invoices and letterhead. It is also useful if you publish a newsletter and want to use the same format from issue to issue.

Speed Tips

One of the biggest complaints when PageStream 2.1 first came out was how slow it was redrawing the

screen. We experienced this problem, but resolved it with the advice of Soft-Logik's Mike Loader who recommends deleting the import/export modules you won't be using in PageStream. PageStream loads all those modules into memory when it boots up, and all this spare baggage only slows the system down. If you have TOS 1.4 or higher, it is recommended that you also set the Fast Bit on the modules you do use. This will allow them to load faster.

Also, the more fonts you have installed—especially Type 1 fonts—the slower the system can become when using many of them. This is partly because of the way PageStream 2.1 caches fonts in memory and partly because of PageStream's improved font display. You now get extremely good font display, but you pay a price in screen redraw time.

By removing unused import/export modules and carefully planning the way you install and use fonts, you can dramatically improve the screen redraw speed of PageStream 2.1. Of course, any of the available hardware accelerators will also help tremendously, and PageStream is *very* nice on a 32MHz TT.

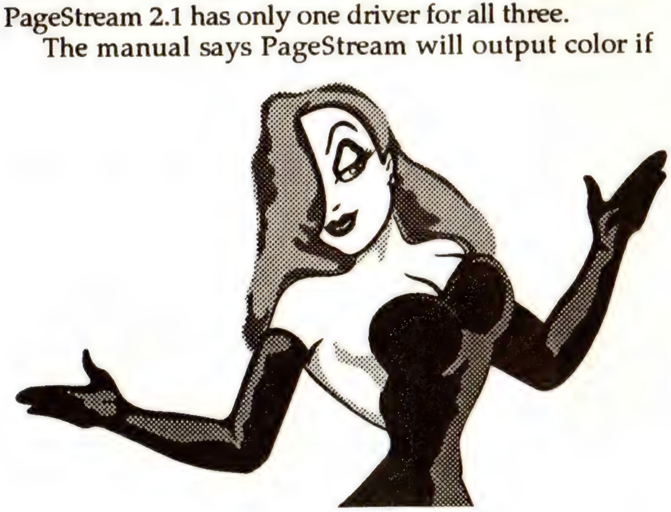
Another tip for PageStreamers outputting to PostScript printers only deals with the Compugraphic fonts. PageStream comes with Times, Triumvirate (Helvetica) and Garamond Compugraphic fonts. But, if you're outputting to PostScript printers, those printers have Times and Helvetica as internal fonts. PageStream will use those internal fonts instead of downloading the Times and Triumvirate font info.

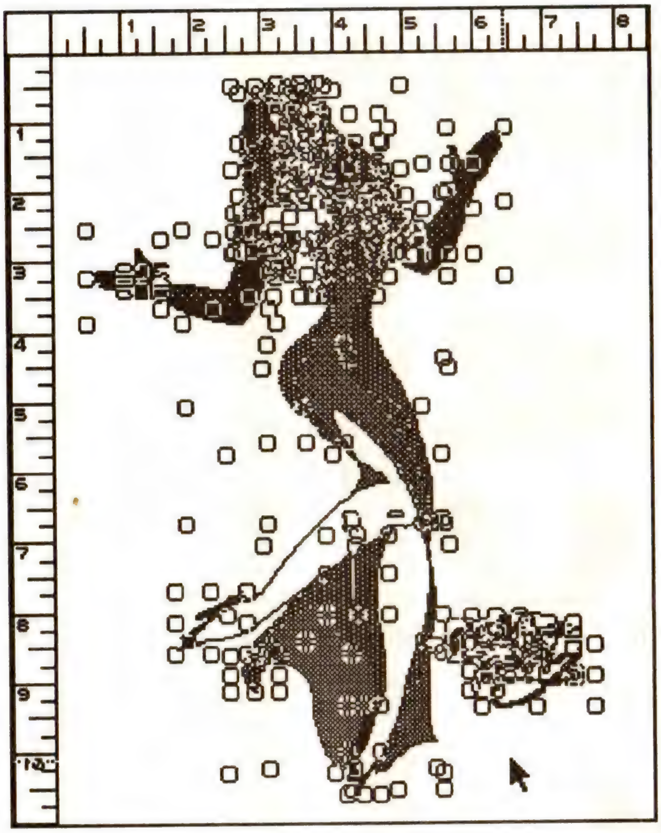
So, if you are using a PostScript printer, you might as well not install those two Compugraphic fonts. This will also speed up PageStream 2.1 a small amount. Unfortunately, this does cause some problems if you regularly accept PageStream 2.1 documents from other people who *do* use these fonts.

Miscellaneous Observations

Finally, if you plan to do any color printing directly to a color PostScript printer, you need to know something that isn't covered in the manual. If you used PageStream 1.8, you know there used to be separate drivers for Linotron, color and "normal" printers. PageStream 2.1 has only one driver for all three.

The manual says PageStream will output color if the No Separation option is selected in the Print dialog. There is actually one other thing that needs to be done for PostScript color printing. You must enter the word *color* in lower case in the Special text field of the Printer Configuration dialog.





We ran a detailed review of PageStream 1.8 in the Fall of 1990 and the December 1990 issue had an article dealing specifically with color DTP using PageStream. If you're interested in more details, you can look up those articles or see PageStream at your local Atari dealer. Also, Soft-Logik can be reached at (800) 829-8608 for sales, (314) 894-0431 for technical support or via their BBS at (314) 894-0057 (3/12/24/9600). Soft-Logik also maintains online support in their RoundTable on GEnie and in the AtariVendor and AmigaVendor Forums on CompuServe.

Bill and I use PageStream to produce this monthly publication and various other DTP jobs, so we're pretty familiar with its nuts and bolts. However, because of that familiarity, I may have overlooked the simple things because they are so commonplace to me. If you are interested in solving a particular problem you're having with PageStream, drop us a Letter to the Editor spelling out what you're trying to do, and what results you have or haven't been getting. We may be able to help.

Delicious Monitors!

The "TOAD RGB" Display

☛ These are the most popular monitors on our menu. And for good reason! The truly spectacular thing about the monitors (excepting the price) is that they support ***three*** kinds of inputs! They have an ST compatible *analog RGB* port, a PC-CGA compatible *TTL digital RGB* port, and a *composite video* input with separate chroma and luma too! Ponder it: using the same monitor on your ST, a PC compatible, an Atari Eight Bit or VCR! They even have an audio input and speaker! The monitors have a beautiful glossy twelve-inch screen and a picture quality which surpasses even the best SC1224 monitors! The monitors are reconditioned (but are factory fresh), and that means that we can offer a complete (parts & labor) six month warranty! The quantity is limited though, so order yours ***toaday!*** Specify cable for ST, Eight Bit, PC, or Cray X-MP.

TOAD-RGB Color Monitor: $239

MONITOR EXCHANGE

☛ Do you have a broken SC1224 or SM124? SC1224's can be exchanged for the SC1435 for $239. Call for the new SM124 to SM1438 exchange price, available soon.

☛ The Atari ST's have always been finicky about monitors. With a seemingly endless array of color monitors on the market (at reasonable prices, too), why should we be bound to Atari brand color monitors? That's a good question. The answer is that the Atari uses *analog* RGB and until very recently, *TTL (digital)* RGB was the norm. Now that the analog systems of VGA and Super VGA are more popular, the analog RGB monitors those systems require are more popular too. So you'd think the problem would be solved. Lo, a quandary still exists. Now, the mainstream monitors are too fast for the Atari's to use! Most VGA and Super VGA monitors have a fixed horizontal scan rate of 31.5KHz, and the Atari runs at 15.75KHz. So, while the RGB standard has changed in our favor, the speed issue is still boxing us in. So when you boil all this down, you get a relatively small set of monitors which will actually work on an ST. This set includes the Atari SC1224 (12") and SC1435 (14") monitors, a few "multisync" monitors (which have the ability to lower their horizontal sync rate to 15.75KHz), and the handful of monitors that, for whatever reason, were made with compatible specifications. We sell them all. If you like the Atari name brand monitors, (including the new SC1435 14" color monitor and the SM1438 14" monochrome monitor) that's cool — we have them. We also have great deals on multisync and other compatible monitors, like the Magnavox 1CM135 and our own refurbished *Toad-RGB* color monitors. So weigh the options and see what fits you best. Any questions? Call the chef!

Thanks for 1991

☛ We had an unbelievable year in 1991. While every other Atari reseller was whining and shrinking, we've kept our chin up, advertised like crazy and reaped exponential benefits. Some companies talk about pushing their sales envelope; we busted ours. We'll be expanding even more in '92, thanks to folks like you: people who appreciate value, humor, and support.

NEW Little-Toad-20 Drive

☛ We've had numerous requests to lower our standards. So we did. But we're doing so openly, so that those of you demanding the highest quality can still get the best products available worry-free. But we've got a cheap hard drive now, the Little-Toad-20, and it's a relatively decent 20MB setup, in a small portable case. Using the Supra Host Adapter and a 3.5" 20MB Drive, it's only **$299!**

GET OUR CATALOG

☛ For our complete menu listing, be sure to call or write us to get a copy of our most recent catalog and to be placed onto our mailing list. No Atari connoisseur should be without our insightful reviews of hundreds of Atari products. Call us at Toad Computers TOADAY to get onto one of the most hip-hoppingest mailing lists around toaday! Get postcards, catalogs and more! All you have to do is call!

True (DTP) Confessions

Ralph C. Turner

(C) Copyright 1992 by Ralph C. Turner

Here's a confession I've never made in public before: the camera-ready copy for my first Atari ST Book was produced on a Macintosh computer. Before you brand me a traitor, let me give an explanation. While I'm at it, I'll also tell you about some of the complications I faced during the course of self-publishing three different books.

For my next book (not yet completed), I decided to work on the cover...

Although I wrote the first book on my 1040 ST (using Regent Word II for some of the chapters, and Microsoft Write for the rest), I owned, at that time, only a dot-matrix printer (a Panasonic KX-P1092). I wanted to send laser-quality, camera-ready output to the printing company I'd chosen, but I wasn't ready to spend what seemed like a lot of money to buy my own laser printer for the ST.

After all, most of my friends had already told me I was a fool to be writing a computer book about anything other than IBM computers. I worried that I wouldn't ever recoup the cost of printing a thousand copies of the Atari ST Book, let alone make enough to cover the cost of a laser printer.

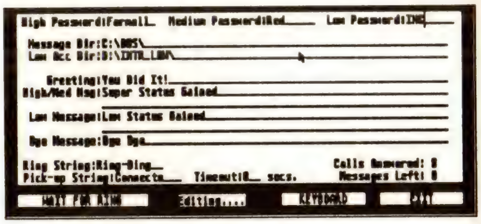
The solution was to use the Apple LaserWriter printer at the company I worked for. Although I could have brought my 1040 ST to work and connected the LaserWriter directly to it, I decided to do the page composition on one of the Macintosh computers at work. I had been using Aldus Pagemaker (on the Mac) to create advertisements, but I was worried that doing the whole book in that program would be a complicated task. Therefore, I decided to try to simplify the job by doing the project in Microsoft Word (on the Mac).

Transfer to the Mac

Since I didn't own a Macintosh emulator for the ST, and since the Macintosh at work couldn't read ST disks, I used two modems to transfer the book from my 1040 ST at home to the Mac at work.

But there was a problem. I was able to use the Macintosh equipment at work, provided I did so in the evening, when no one else was there. If I could have elicited the help of someone at work, I could have stayed at home to operate my ST's modem, while the person at work operated the Mac's modem. Instead, I had to figure out some way to perform the whole operation myself.

Before leaving home, I hooked my Avatex 1200 modem to the ST and ran the Interlink telecommunications program on my ST, then set up that program's "Answer Mode," which turns Interlink into a mini-BBS. I designated the word "Farmall" as the password for the answer mode, then drove the two miles to work.



```
High Password:Farmall  Medium Password:Red  Low Password:[illegible]

 Message Dir:C:\BBS\
 Low Acc Dir:[illegible]

   Greeting:You Did It!
High/Med Msg:Super Status Gained

 Low Message:Low Status Gained

 Bye Message:Bye Bye

Ring String:Ring-Ding                              Calls Answered: 0
Pick-up String:Connecta   Timeout:0  secs.         Messages Left: 0
```

There, I hooked a modem up to the Mac, ran the Red Rider telecommunications program, and had the modem dial my home phone. The phone rang, my ST picked up the line, Interlink asked for the password, I typed it in.......and nothing happened.

To make a long story longer, I ended up driving back and forth between home and work at least six times before I discovered the proper parameters and settings to make the transfer work. I had saved (on my ST) each chapter in its own ASCII file, so I ended up transferring 17 files from the ST to the Mac.

Document Size

Once in the Mac, I loaded the files

into Microsoft Word. It was there that I made my first major mistake: I decided to create one big file containing the whole 158-page book. This resulted, later on, in delayed printing (in other words, it took a heck of a long time to print) and, at times, corrupted printing.

After I had done all the page layout in Word, and after I had printed the whole book, I found certain mistakes on selected pages. But after correcting a mistake, (say, on page 148) then telling the printer to print the corrected page, the page would emerge with one or two words missing that should have been at the beginning or end of the page.

Apparently, the 158-page document was too large for the program (or too large for the computer's memory, or something) and the mere act of making an alteration that was deep into the file messed up the pagination. (Of course, to be fair to Microsoft Word, it should be noted that the Macintosh/Laserwriter combination was not known for its speed, at least in comparison with, say, an Atari laser.)

It was a real headache, but I worked around the problem by creating a new, one-page document containing just the page that I wanted to reprint. If I had to do it over again, I would make each chapter its own document in the word processor.

Soliciting Print Bids

After soliciting bids on the print job (the highest bid was twice the amount of the lowest bid), I finally decided on a large book printing company 180 miles away from where I live, but in the same state. I'm the sort of person who worries about everything that can go wrong, and I reasoned that, if the printer messed up the job but wouldn't return my deposit, it'd be easier to sue them if they were in-state.

I remember vividly the moment I hung up the telephone, having just told the printer to go ahead and start the job. As soon as I was off the phone, I started shouting "Rebel yells" and jumping up and down. I hadn't been that excited in a long time, and it was wonderful knowing that "the die had finally been cast."

In typical Midwest fashion, the printer had agreed to do the job with 1/3 down, the remainder to be due one month after delivery. He didn't perform a credit check, as far as I know, but rather, apparently, relied on his reaction to the sound of my voice. We had been dealing with each other only on the phone.

A few weeks later, I received the call that the books were done, and I decided to make the 360 mile round trip in my car to pick up the books. I think the printer thought I was crazy, since everybody else uses UPS or a freight company. But I was afraid that the job might have been botched up, and that if so, it'd be better to find out *before* the books were shipped.

Proof It Before You Pay

Sitting in one of the executive's offices at the printing company, I took my time checking each page of the book. I made sure each page was in order, and that the contents of each page was positioned properly. Although I had received proofs a week before, I was still nervous. But everything was OK, and I stuffed the boxes of books into the car and headed home.

Have you ever loaded a car with 1,000 pounds of baggage? Well, I'll never do that again. I ruined the car's shocks and springs during that harrowing drive, and I now rely on truckers or UPS.

The DTP Program

Soon after completing the first book, I decided I needed my own desktop publishing program, to be run on the ST. I tried Timeworks' DTP, found it was cumbersome on a floppy drive system, built myself a hard drive system, then discovered Timeworks was still not to my liking. The single most important thing a DTP program must provide me is good output (what does the page look like when it comes out of the printer?), and Timeworks didn't satisfy me.

Many people recommended PageStream, but I bought Calamus. It was sort of hard to learn how to use and the manual was a little strange, but once I got the hang of it, I loved it. And I still do. It's a superb DTP program.

The HP DeskJet

By the time I wrote the second book, I owned a Hewlett Packard DeskJet inkjet printer, but still didn't

NO EXCUSES!

20 MEG Hard Drive

$269

☑ Complete system, plug 'n go
☑ Premium Quantum Case
☑ Supra SCSI Host & Clock
☑ Case holds 2 hard drives
☑ Free PD Software on HD

Still running from Floppy Drives?

40meg $319

Space for 2 Drives

Same size as Megafile

If your excuse for not purchasing a hard drive is the high $400+ price tag your wait is over. This complete ready to run system costs just a few bucks more than a bare drive! You won't have to give up quality or speed. We use top components such as Seagate, Conner, Sony & Quantum, Supra & ICD hosts. The deluxe 2 drive capacity undermonitor style case is built by Quantum, & is ready for use on the Atari ST/TT computer. (List price for case is over $200 without a drive!) Access times from 40ms to as fast as 4ms, warranties up to 5 years available. *Limited Quantities !*

Case only w/cables etc.	$ 89
Case, Supra host/cables	$169

own a laser printer. My plan was to use the DeskJet at home during the page layout process (using Calamus). Then, when I was finally ready to make the final copies of each page, I planned to drive 150 miles to the closest Atari laser printer that could be rented.

I had promised the printer I'd get the copy to him on Monday, and two days before (Saturday), I arrived at the Atari store that had the Atari laser. The printing went fine until halfway through the book, at which point the laser ran out of toner. The store didn't have any more.

I drove home and completed the job on the DeskJet. So, the second book was done partly on an Atari laser, partly on a DeskJet. Actually, the comparison between these two printers is interesting. Although the Atari laser did a much better job on most of the text, the thin lines that constitute the outlined letters at the beginning of each chapter were done better on the DeskJet. Of course, the Atari laser was lightning fast, and the DeskJet's smearable ink provided a potential problem. (Hewlett Packard supposedly has non-smearable ink now.)

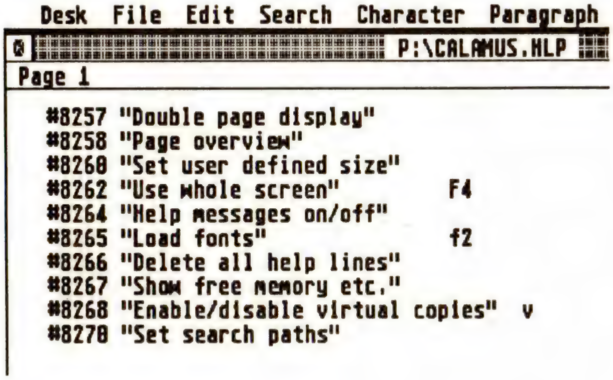
The HP LaserJet III

For the third book, I bit the bullet and bought a laser printer. Although I was sorry to forgo the Atari laser's speed, I decided to buy Hewlett Packard's LaserJet III. Its output is superb, and it works beautifully with Calamus (but of course, so does the Atari laser).

Define Keyboard Layout

By the way, among a number of Calamus features that I like, I especially appreciate the fact that the program allows you to define your own keyboard layout. Although I have nothing against using the mouse, I *don't* particularly like a program that *forces* me to use the mouse to make menu pull-down choices for commonly performed tasks. I'd rather use the keyboard.

Calamus allows me to assign any task or function of the program to any function key (with shifted function keys, that means 20 possibilities) or to any "Alternate-plus-any key" combination (that provides an additional 56 or so possibilities). The assignment is done by using a word processor to edit a file called CALAMUS.HLP.



```
#8257 "Double page display"
#8258 "Page overview"
#8260 "Set user defined size"
#8262 "Use whole screen"            F4
#8264 "Help messages on/off"
#8265 "Load fonts"                  f2
#8266 "Delete all help lines"
#8267 "Show free memory etc."
#8268 "Enable/disable virtual copies"  v
#8270 "Set search paths"
```

Flash, the telecommunications program, also allows program functions to be assigned to specific keys, and I wish more program were like Calamus and Flash.

Reducing is Better than 1 to 1

For the third book, I deliberately made the camera-ready copy larger than the ultimate size of the book's pages. Specifically, although a page in the book was going to be 8.5x5.5 inches, I made the printing area on my camera-ready copy approximately 10.5x6.5 inches. In the process of photographing these pages, my printing company had to reduce them, but the reduction process resulted in more sharply defined characters and images.

Linotronic Images

The covers of all three books were linotronic images: for the first two books, I hired a professional graphic artist who created his work on a Macintosh and gave me a Macintosh floppy disk with a Pagemaker file on it. I took the disk to a printing shop, and the cover was printed on the Linotronic (the Linotronic for the second book cost about $20).

For the third book, I used Calamus to do the work myself. I sent the Calamus file to a printing service bureau on the West Coast, and they returned the Linotronic image to me by Federal Express (the image cost about $15.00).

For my next book (not yet completed), I decided to work on the cover even before writing a single word of text. I now have the cover done, and I like to look at it each day before I start writing. It allows me to visualize the finished product, and that can be useful, especially with a project that can take a year or more to complete!

Ralph C. Turner is the author of three books about the Atari ST and TT computers: "The Atari ST Book of Tips, Instructions, Secrets and Hints," "Intermediate and Advanced Atari ST Topics," and "Turner's Third Book of Atari ST Topics," all published by Index Legalis, P.O. Box 1822-68, Fairfield, IA 52556; (515) 472-2293. This column is copyrighted 1992 by Ralph C. Turner.

Turner's Third Book of Atari ST Topics covers connecting musical instruments to the MIDI ports, modems, the TT030, telecommunications software, laser printers, BBSs, database transfers, CompuServe & GEnie, public domain & shareware programs, null-modems, MIDI keyboards, and much more. Also available: *The Atari ST Book*, and *Atari ST Subjects*. Each book, $16.95 + shipping (US:1 or 2 bks, add $2.00; $3.00 for 3 bks). (Canada: add $3.50 for 1, $4.75 for 2, $6.50 for 3 bks). DTP Building Blocks

Bill & Pattie Rayl

Excellent DTP packages like Calamus and PageStream have been available to ST/TT owners for years. Until recently, though, the ST lacked many of the DTP tools that Mac and IBM owners enjoy. These "DTP building blocks" are the foundation necessary for a complete DTP environment—B&W and color scanning software/hardware, OCR software and vector graphics drawing programs to name a few examples.

If you've chosen an ST or TT for your DTP work, you no longer need to wish you had the tools available to those other guys. They're here on the ST and they're available now, many of them at prices well below what Mac or IBM owners pay.

In this article, we'll try to outline what's available in the various general categories of Fonts, Font Editors/Designers, Clip Art/Graphics, Scanning and Drawing. We'll rap up with a look at some of the new, high-end products being released. Ready? Well, let's go, then!

Fonts

Once you get into DTP work, it seems you never can get enough fonts. Sure, you can get by with a few of the traditional fonts, but what about those special occasions? Like doing a brochure for a local Star Trek convention—sure would be nice to have a Trek-type and a Klingon font (Computer Safari has both).

AIM in Klingon Font

PageStream and Calamus users have never lacked good font support. There are about a dozen different sources from which fonts can be purchased at very reasonable prices. For the absolute highest quality fonts, Soft-Logik and ISD Marketing both sell superb font packages for their respective DTP programs.

ISD has a full line of AGFA Compugraphic fonts ranging from $99.95 to $299.95 per disk (all prices in this article are in US dollars). ISD is currently running a "buy one get one free" special on these fonts!

Soft-Logik is marketing packages of Type 1 fonts designed by Image Club, one of the premier Macintosh font producers. Their Starter, Newsletter, Designer and Classic font sets contain a total of 48 popular fonts that are perfect for most DTP jobs. If you're looking for a specialty font, though, you can pick from 600 Type 1 fonts. Each font is available for just $25 per weight/style. Best of all, Soft-Logik is promoting these fonts with a "buy one get one free" limited offer, as well!

ISD and Soft-Logik don't have a monopoly on high quality fonts, though! For excellent body type fonts for Calamus, Cherry Fonts (now marketed by the CodeHeads) can't be beat. Other good Calamus font sources include Mainstream Fonts and Ideal West.

Alien Nation Font

If you're looking for PageStream fonts or you use both PageStream and Calamus, you'll want to pick up a few packages from MegaType, Computer Safari, Dennis Palumbo, MS Designs, Fonts by Guber and FontAbility. These companies all produce great headline and specialty fonts, as well as some of the more down to earth font families. Most of their fonts have Calamus and PageStream versions.

MegaType and Computer Safari have both recently released Type 1 font packages for use with PageStream 2.1. Computer Safari has an incredible $119.95 deal on a package of 250 Type 1 fonts! We've been showcasing the MegaType Faces Paks in our DTP Resource section for the past few issues.

If you want to keep abreast of the ever-growing list of font vendors and font packages available, we suggest you get a copy of the Calamus Font Resource Guide. The Guide focuses on Calamus, but also covers PageStream fonts. It's put together by Page Design & Consulting Service of Holland Landing, Ontario, Canada and is distributed by PDC of Lynnwood, WA.

Font Editors/Designers

The "average" DTP user may never have the desire or need to resort to creating a font for some special purpose. Being able to manipulate or create your own fonts can be important, though, especially in a commercial DTP environment. Many magazine publishers or advertising copy design firms have a font design artist on their design staff.

Here, the ST has also had excellent support for some time. The premier font design program for Calamus is the Genus font editor. Genus allows editing of all Calamus fonts, including the AGFA Compugraphic fonts sold by ISD. Options include the ability to load bitmap images (IMG or DEGAS formats) for character tracing, as well as the ability to load two fonts and swap characters between them. Genus also gives you the ability to convert PageStream fonts to Calamus format, as well as import and export CVG vector graphic files. CodeHead Software has recently taken over distribution of this excellent program. Retail price for Genus is $175.

On the PageStream side, MegaType has a number of offerings. Font Designer ($124.95) supports import of DEGAS or IMG bitmaps for tracing, a "segment" feature for building parts libraries to speed font design and font templates. With Font Designer, you can create Type 3 (PageStream) format fonts.

One step up, Font Designer Plus ($249.95) adds the

ability to create Type 1 fonts with hinting, as well as Type 3 fonts. FD+ can output directly to a PostScript printer for testing your output, as well as save your font characters to disk as EPS graphics. The package includes Type 1 Converter ($39.95 separately), a program to convert any PostScript Type 1 font into Font Designer's internal ECF format.

For DTPers who only want to convert fonts between Calamus and PageStream formats, MegaType offers FontVerter. At $49.95, this package gives you everything you need to transfer fonts from Calamus to PageStream, or vice versa. Users of both DTP packages will find this tool indispensable!

Another useful PageStream font tool from MegaType is Bit Maker ($39.95). Bit Maker automatically creates screen fonts (in 12, 24 and 36 point sizes for the ST and 14 point for Amiga) from the DMF file created by Font Designer, FontVerter or Soft-Logik's own Shareware editor.

Clip Art/Graphics

Sources for line art and bitmap graphics have been available almost since the ST was released. It has taken some time, though, for high quality graphics—the kind usable in professional DTP layouts—to be available for the Atari.

The first company to release commercial quality bitmap IMGs and vector graphic (GEM) clip art was Migraph. Migraph was, and still is, a leader in the DTP support market for the Atari. They were the first to release a hand scanner with editing software and the first to market vector graphics editing software.

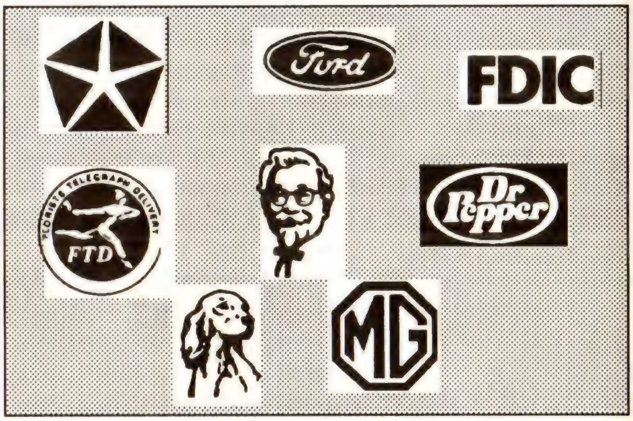
Migraph's DrawArt and ScanArt packages pioneered the ST professional clip art market. With the release of Calamus Outline Art, ISD also began selling professional clip art disks, in both GEM and CVG (Calamus Vector Graphic) formats.

IMG Bitmaps

Today, the Atari DTPer has a multitude of high quality clip art choices, and the options are expanding. For bitmap, scanned IMG graphics, Electronic Spinster is the ultimate source. Their recent catalog contains hundreds of IMG clip art disks, and they are adding many vector graphic (GEM, EPS and CVG) disks. Electronic Spinster sells their IMG disks for $15 for each volume (4 disks) or three for $40. Vector graphic disks currently range from $12 to $25.

CHQ, Inc. is another source for quality IMG disks. They have over 50 DS/DD disks with IMGs for nearly any occasion. At $12.50 per disk, you really can't go wrong.

Sterling Connection, a company most known for its spreadsheet templates, has released Logo Library, a collection of over 600 company logos and over 450 graphic symbols in IMG format. These 300 dpi graphics come on six disks, along with a 72-page manual displaying all the images. While some of the images are small and may need touching up, the whole package is only $39.95.



Vector Graphics

Vector graphics—EPS, GEM or CVG formats—give the best quality output at any resolution. Because these graphics are resolution independent, they can be enlarged or reduced without any ill effects. On linotronic output (1270 dpi or higher), these graphics can be quite impressive.

For Calamus Vector Graphics, the two best sources are ISD and Electronic Spinster. There are not very many new packages being released in the GEM format. ISD, Migraph and Electronic Spinster are the best places to turn for those.

Time Savers!

New! LogoLibrary™

LogoLibrary consists of over 1060 images for desktop publishing. Includes over 600 printer's logos for business advertising, stationery, etc. In addition there are 460 symbols and graphics for charts, posters, shirt designs, signs, etc. All images are hi-res 300 dpi graphics in .IMG format for PageStream, Touch-Up, Calamus, Publisher ST. 6 d/s disks & 72 page directory. $39.95.

Qwikforms™ for PageStream™

The key to quick and easy, professional-looking forms and documents is Qwikforms™, the only package of business and personal forms with over 100 different, adjustable layouts. Just choose the one you want, insert your name, logo, or text, and print. Business forms include invoices, inventory control, real estate forms, job estimates, applications, organizers, ledgers, charts, etc. Page layouts include newsletters, letterheads, business cards, brochures, booklets, envelopes, press releases, resumes, etc. Legal forms include wills, deeds, claims, bill of sale, power of attorney, etc. Personal forms include announcements, cards, architectural symbols for home planning, mail lists, invitations, etc. There are also guides and many other unique and unusual uses of PageStream. Includes 2 free disks of PD clip art, symbols and logos, and other useful desktop publishing accessories. State which computer you have. $39.95

Cliptomania™ 10 full d/s disks of hi-res PD clip art in .IMG format for use with PageStream, Publisher ST, Touch-Up, and Calamus. Categories include Advertising, Animals, Cartoons, Fantasy, Holidays, Letters, People, Restaurant, etc. Over 360 images! $39.95

Templicity™ Home and Small Business Spreadsheet Templates for LDW and VIP Users!

Now you can instantly use your spreadsheet to calculate and analyze mortgage rates, do your bookkeeping, calculate your income tax, estimate the maximum affordable price for property, design a savings program for education, count calories, create invoices, etc. This package of 104 prefabricated spreadsheet templates covers everything from accounting and budgets to inventory and real estate. Tax templates are upgraded each year for $5.00. Available in separate versions for LDW Power and VIP Professional. $39.95

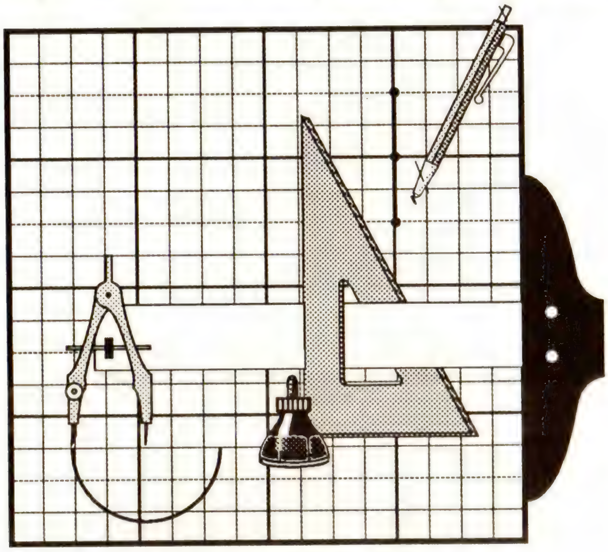
Encapsulated PostScript (EPS) is, by far, the most widely supported vector graphics format. With PageStream 2.1's ability to edit Illustrator EPS files and print them to *any* printer, a whole new world has opened up. And, companies have moved to support the demand.

Computer Safari released their Professional Logo Series of over 30 images over a year ago. They were the first to offer EPS clip art. A recent flyer from Computer Safari had the package listed for only $18.88.

By far, the biggest market for EPS clip art has been for the Macintosh. So, it should be no surprise that ST developers have begun licensing these Mac EPS clip art packages and releasing them on ST disks. Again, Computer Safari led the way with Clipables, over 600 professional EPS graphics on 17 disks licensed from C.A.R. Inc. Some months back, Computer Safari ran a special on this package for only $124.88, but the price is probably a bit higher now.



Not to be outdone, Soft-Logik is marketing 21 different volumes of Image Club clip art. Each volume has a specific theme, such as World Maps or Celebrity Caricatures. The brick background used on this month's cover came from Volume 18, Backgrounds. Prices may vary for individual volumes, so contact Soft-Logik for details.

AlohaFonts, primarily an Amiga developer, has released their Eclips I and II packages of EPS graphics for the ST. While these graphics are not Illustrator-compatible and cannot be taken apart/colored in PageStream, they are very high quality and cover a wide variety of topics. Eclips I has over 300 graphics, while Eclips II contains over 200 illustrations. At $99 per volume, Eclips II works out to 50¢ per graphic and Eclips I even less expensive!

Other sources for EPS clip art are available in the Macintosh and IBM world and even the Amiga market. Most of these companies producing EPS clip art sell the packages on IBM 3.5" disks. Spectre GCR owners have the added ability to directly use Macintosh disks. Check out recent magazines catering to those computers or pick up the latest DTP magazines to find out more about these sources.

Bitmap to Vector

If you already have a library of bitmap graphics—DEGAS, IMG, IFF, TIFF, et cetera—you might want to think about converting this library to vector images.

The first bitmap to vector convertor to hit the ST market was Silhouette from Maxwell CPU. Silhouette is actually a vector graphics drawing program with autotracing capabilities, so it's more than just a conversion utility. The program can load DEGAS, IMG, MacPaint or TNY format bitmaps, as well as GEM metafiles. Silhouette's autotracing function uses b-spline or Bezier smoothing. Graphics can be saved as IMG bitmaps, DXF (CAD format), GEM or EPS vectors. At $94.95, Silhouette is a good bargain.

At the high end of the market, both in price and performance, is Avant Vector. Sold in the US by CodeHead Software, Avant Vector is packed with features. It has all the drawing/editing capabilities of Silhouette and a few more besides. Avant Vector can load DEGAS, IMG, IFF, TIFF and other bitmap graphic formats. It can import or export in Calamus CVG, GEM/3 and EPS vector graphic formats. No matter what DTP package you use, Avant Vector won't let

SHAREWARE & PD

A great PD catalog with great prices!

It's true! Our catalog offers full multi-line descriptions for over 150 double sided disks packed to the brim with the very latest public domain and shareware software—all archived to give you the most for your hard-earned money. Each disk is also protected by a virus guard to eliminate any worry about system problems.

Send $6.00 for your 80+ page catalog and receive a bonus $6.00 coupon for a complimentary first purchase. Our everyday low price is $6.00 per disk.

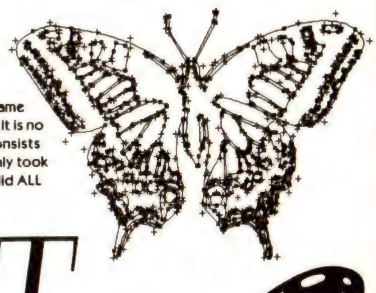
OakSprings Software

This small butterfly is unremarkable. The others are a new species you can breed on your Atari computer.

Automatic vectoring has arrived.

To the left is a pixel-based .IMG picture. In other words, the picture is made up of dots. It's a 58k file. The image can't be enlarged much more than this without the ragged edges showing. (In fact, they're showing already.)



To the right is a snapshot of the same image after it has been vectored. It is no longer made up of dots. It now consists of lines and bézier curves. This only took a few minutes and Avant Vector did ALL the work for you.

AVANT VECTOR

Avant Vector is a cutting-edge graphics tool that's fast, easy to use and surprisingly versatile.

The large butterfly wing on the right is a vector image created by Avant Vector. Using "automatic tracing," a bit image graphic (the smaller butterfly) was converted to a vector graphic, resulting in the smooth output you see here.

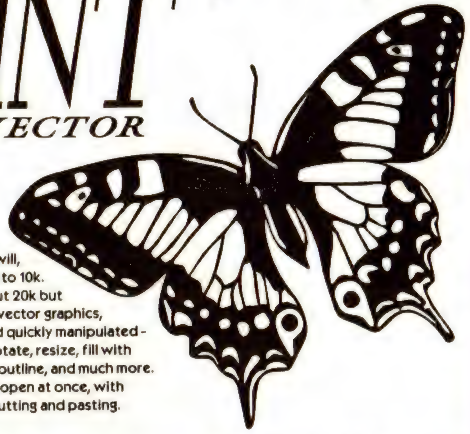
Vector graphics have big advantages over bit image graphics - they make much smaller files, and they can be scaled to any size without losing resolution or looking blocky. And Avant Vector's tracing routines are highly sophisticated; in a recent review of 7 Mac, PC, and ST auto-tracing programs, Avant Vector was rated best of the bunch! This means there's less editing after tracing an image, and you get more work done in a shorter time.

Avant Vector supports .PI3, .PC3, .IMG, .BLD, .PIC or .PAC formats. You can trace Mac, PC or Amiga graphics, in .TIF, .IMG or .IFF formats. The plotter version (Avant Plot) can also load and save HP plotter files.

No matter which DTP package you use, Avant Vector is a wonderful companion. It creates .CVG files for Outline, Calamus or Repro Studio. And .GEM files for use in programs that support GEM3 metafiles. Avant Plot allows EPS importing and exporting, and a full range of professional plotting, drawing and cutting options.

Since Avant Vector is a full featured vector graphics package, you can touch up any picture you've auto-traced, or draw pictures from scratch - with an intuitive, speedy interface you'll learn in a matter of minutes!

Call or write CodeHead Software for more information about Avant Vector (and its amazing cousin, Repro Studio). Special introductory pricing is available until December 31, 1991. Act now and save!



This is the .CVG vector version: it can now be enlarged or reduced at will, and the file size is down to 10k. The .GEM version is about 20k but otherwise identical. As vector graphics, the images are easily and quickly manipulated - you can stretch, skew, rotate, resize, fill with gray scale percentages, outline, and much more. Up to 7 windows can be open at once, with clipboard features for cutting and pasting.

CODEHEAD SOFTWARE

P.O. Box 74090 • Los Angeles, CA 90004 • (213) 386–5735 • fax (213) 386–5789

you down. Avant Vector currently retails for $495.

If you're just looking for a program to convert bitmaps to vector images, Gribnif Software has Convector. Convector doesn't contain the drawing and editing capabilities of Avant Vector or Silhouette. Instead, it is more focused on graphic conversion and has a retail of $99.95. As of this writing, Convector has not yet begun shipping and we have no details on what graphics formats are supported.

All these programs mentioned above deal with monochrome/grayscale images only. Silhouette and Avant Vector both have "fill" functions, but they do not support color.

For PageStream users, adding color to Illustrator EPS graphics is a fairly easy process. With the imminent release of Calamus SL, ISD has also announced availability of a Vector Graphic Editor module for $99.95. This module allows creation or editing of vector graphics, including the ability to add color.

Drawing Packages

When it comes to DTP, a typical drawing package like DEGAS just isn't enough. When dealing with bitmap images, you need a program that can handle high resolution scanned images and/or vector graphics. For color DTP work, you really need 256+ color and high resolution support.

Finding a drawing package that supported both bitmap and vector graphics was pretty tough until recently. In fact, Migraph's Easy Draw (GEM) and ISD's Outline Art (CVG) were the only available vector graphic options, and they don't support bitmap graphics. Now, thanks to a couple German imports, you have a choice of packages.

Arabesque Professional, marketed by Gribnif Software, supports IMG, IFF, DEGAS, NeoChrome and Doodle bitmap formats. On the vector side, you can load and save GEM/3 and Calamus CVG graphics, as well as use Arabesque's own compression format. Suggested retail is $199.95.

Competing head-to-head with Arabesque is MegaPaint Professional from CodeHead Software. MegaPaint itself supports IMG, PCX, Degas and STAD format bitmaps an Calamus CVG vector graphics. Add-on modules for MegaPaint (recently released to the public) add the ability to import DEGAS Elite and TNY format pictures, as well as interface to the Scan Lite scanning software from WizWorks!. Retail price for MegaPaint is $175.

Both programs are very powerful and highly sophisticated monochrome graphics tools. For Calamus owners, either one is a good buy. PageStream owners will have to look elsewhere for EPS support, but the CodeHeads have indicated that an external EPS module for MegaPaint isn't out of the question.

ISD's Outline Art, with a retail of $289.95, does come with a utility to convert CVG files to PostScript ASCII EPS graphics. While you cannot view, edit or colorize these images in PageStream, they do load in and work fine.

There is currently no vector drawing program available that saves EPS graphics, let alone Illustrator-compatible ones. For that ability at this time, you must either use Macintosh tools via Spectre GCR or opt for one of the bitmap to vector conversion utilities.

Image Scanning

Migraph introduced the ST community to the joys of scanning with their Touch-Up and hand scanner combo. Aside from Migraph, only Navarone (with their Canon flatbed scanner interface) was supporting this important part of the DTP scene.

A newcomer to the scene, WizWorks!, released MultiViewer (Graphica). MVG supported a number of hand scanners via external modules and was an instant hit. The latest release from WizWorks! is Scan Lite. Existing graphics programs can be updated to interface with Scan Lite, turning your paint program into a graphic scanning package! As mentioned above, MegaPaint Professional already supports Scan Lite via an external module.

MegaPaint also directly supports the PrintTechnik Universal Scanner and Professional Scanner 2, as well as the HAWK CP14 scanner. These scanners, along with their ST-specific drivers, are not generally available in the US.

Color Graphics

In the color arena, the only bitmap drawing package available for practical DTP work is Prism Paint from Lexicor. Prism Paint supports the ISAC (Dover Research) and Matrix color boards, as well as the TT resolutions. The ability to output IFF or GIF bitmap graphics allows Prism Paint illustrations to be directly imported into PageStream. Retail price on Prism Paint is $79.95, but RIO is currently selling it for only $49.95!

High-End Color

A few years ago, color DTP was just starting to emerge as a force to be reckoned with. Today, good color DTP tools are available for any serious DTP platform. These tools, while carrying a hefty price tag, perform some pretty incredible things that make them well worth the cost.

For color scanning, the only option currently available to US ST/TT owners is from Goldleaf Publishing. They have a package which includes Epson ES 300C 24-bit color flatbed scanner, scanning software (from 3K Computerbild in Germany) and interface. For those not up on the terminology, 24-bit color graphics can have 16.7 million colors. Retail price for the package is $2100. While the ES300C can be purchased from many sources for around $1300, Goldleaf does not sell the interface and software separately. The interface plugs into the serial *and* parallel ports of the ST/TT.

TEC

Tos Extension Card

Upgrade your 520ST, 1040ST, Mega ST, or Stacy to Atari's new TOS 2.06!

TOS 2.06

The equivalent of a brand new computer for less than $140!

CodeHead Technologies is proud to announce the TOS Extension Card! This amazing device lets you install the very latest version of Atari TOS (2.06) in your 520ST, 1040ST, or Mega ST!

That's right! Now, you can have the same excellent system software that owners of Mega STes and TT030s are enjoying, without spending megabucks for a whole new computer system.

TOS 2.06 is a major upgrade, including a completely rewritten GEM desktop that incorporates most of the features of the popular alternative desktop programs, but with two big advantages: it doesn't gobble up large chunks of memory, and because it's in ROM it takes no time to load from disk!

The TEC is a tiny card that fits in any model of ST computer, regardless of design. It works with existing upgrades, like MS-DOS emulators or hardware accelerators. If you have a Mega ST, or an ST with a socketed 68000, you can choose one of the solderless plug-in versions. You can even flip a switch and return to your older TOS, to run software that's incompatible with TOS 2.06. And the low price of $139 includes the ROM chips!

Step into the future and order your TEC today!

CodeHead TECHNOLOGIES

PO Box 74090 LA, CA 90004 213-386-5735 Fax 213-386-5789

For touch up and editing of 24-bit color images on the ST or TT, there are currently three professional packages—two available now from Goldleaf and another, from ISD, shipping shortly.

3K's Retouche Professional CD is available now from Goldleaf Publishing. The software can deal with 256 colors from a 16.7 million color palette at one time. The software has full color correction and separation support built-in. Retouche uses its own proprietary "screening" method and can handle resolutions up to 394 LPI. (To give you an example for comparison, photos in magazines are usually produced at around 120-133 LPI, newspaper photos at around 85 LPI).

Retouche CD is specifically designed for creating, editing and reproducing halftone and color pictures for imagesetter output. It does *not* support PostScript. With a retail price of $1,999.95, the package is targeted to professional design studios, service bureaus and large magazines or advertising agencies. Basically, if you can afford to have an imagesetter (approximately $30,000) on-site, Retouche CD is a good front-end to it.

For smaller firms, Goldleaf has a package called Didot Professional. While Didot is actually a page layout program (like PageStream), it actually has many bitmap and vector graphic editing capabilities. Didot Professional includes a vector graphics editor and can combine scanned images with vectors. you can even "texturize" vector graphics with natural surfaces like marble or wood. Again, unfortunately, Didot does not support PostScript, so you can't just output your pages or graphics to a local service bureau. Didot outputs in a format usable with Retouche Professional. Suggested retail is $999.

The color image manipulation program for "the rest of us" is tms Cranach Studio, soon to be released in North America by ISD Marketing. Cranach Studio is perfect for retouching, enhancing or color correcting 24-bit images or editing grayscale pictures. The modular package can import and export a wide variety of graphic formats and is compatible with Calamus SL. It can even do 4-color (or 3-color CMY or RGB) color separations.

The Draw and Paint modules for tms Cranach Studio offers crayon, watercolor, airbrush, lacquer and other special effects. You can take advantage of paint functions to simulate fingerpainting or oil painting. As an add-on module, tms Vector Studio provides autotracing bitmap to vector conversion, as well as vector to bitmap—including color support! This package has not yet begun shipping and suggested retail has not been announced. We have, however, seen it in action and it is *impressive!*

Observations

It's been a long time coming, but the ST and TT platforms finally have all the tools needed for a professional DTP environment. Some of these tools are only now reaching the market. They aren't as "mature" as some packages available in the Mac or IBM market, but they do stack up favorably against them. And, it seems that the general DTP community is starting to take notice.

At the recent Seybold Electronic Publishing show, Atari made a big impact. With a spotlight article in the Seybold Report, followed by coverage in the latest issue of Business Publishing, Atari has the attention of some important and influential people in the DTP marketplace. Hopefully, Atari can keep that attention focused!

Running with the Stars

Interviews with Greg Wrenn and Jon Willig

Bob Komives
(FRAUG)

[First published in The Lilly Pad, newsletter of the Front Range Atari Users' Group. Reprinted with permission. Greg is a Lockheed engineer working with NASA; Jon is the Atari dealer who sold NASA Greg's New TT030.]

"I just sold a TT to NASA," Jon Willig said as he hung up the telephone.

After more than ten years of having no Atari Dealer within seventy miles of my home and office, I enthusiastically walk the seven blocks to Run PC since it opened here in Fort Collins, Colorado earlier this year. I had found Jon, the owner, to be competent and believable. Yet, I did not want to believe him on this one. Nobody buys Atari computers. Almost nobody has seen a real TT.

We local Atarians found RUN PC quickly—but the National Aeronautics and Space Administration? He finally convinced me. Then, my disbelief turned to curiosity. We all know it takes either a strength of conviction or a touch of rebellion to use Atari computers for serious work these days. What does it take to open a store or a high-tech bureaucracy to Atari computers. Why not ask?

I gave Greg Wrenn, the recipient of NASA's TT, some time to use his machine before calling him to satisfy my curiosity. Then, I walked over again to Run PC where I got a brief, but insightful, interview with Jon. Greg's answers to my questions have to hearten the most discouraged Atarian.

In a high-powered environment where IBM PCs and compatibles have been mostly discarded in favor of Macs and Sun workstations, three Atari 1040 STs and one bright new Atari TT030 have found a niche and held it well.

Jon's words will be most encouraging if they prove to sound a successful counter attack by Atari in the American market. Run PC sits across the street from an 18,000-student technical university, Colorado State. Jon did his homework before becoming one of Atari's newest dealers and AEGIS Strategic Partners.

He and Atari face the same lull in the computer market that has hit the big guys hard. Jon is realistic about the risks, but also enthusiastic and optimistic. Enough said by me. Greg and Jon speak for themselves.

Komives: Greg, as I understand it, your new system is an Atari TT030 with 8 megabytes of RAM (4 in ST and 4 in TT Fast RAM), a 50 megabyte hard drive, the high resolution PTC1426 color monitor and a Spectre GCR Macintosh emulator.

Greg Wrenn: Yes, that is correct.

What do you and your computers do for NASA?

I work for Lockheed Engineering and Sciences Company at NASA's Langley Research Center in Hampton, Virginia. I'm a staff engineer in a section called Multidisciplinary Analysis and Optimization. We use an awful lot of computer systems here, mostly UNIX. We develop computer programs and, more importantly, methods to design aircraft or spacecraft structures that use all the various engineering disciplines. We're concerned at the moment with aerodynamics, structures and performance.

Do you personally use the TT030 system?

Yes.

How did you come to pick ATARI?

Well, I've been an Atari user for quite a few years. We have three 1040 STs in the office here, too. We wanted something with high resolution and more speed, so we convinced our NASA people to let us purchase the TT. We would not have purchased another Atari if we had not been able to get something at this level. Every piece of equipment we have here is owned by the government. It has to be on their approval that we purchase anything.

How do you use the 1040s?

We convinced NASA to let us buy those—primarily to use as dumb terminals to the NASA mainframe computers. We also do all of our word processing on them, some FORTRAN program development, spreadsheets, and database—the generic office-type work. We use the LDW Power spreadsheet, which turns out to be a really good choice. We use Prospero FORTRAN. For word processing on the 1040s, we used WordPerfect and, more recently, Wordflair II.

Are you pleased with Wordflair II?

Yes. It's not particularly good on the 1040s, because we have the color monitors. The resolution is not particularly good with those. On the TT, it is a wonderful program. I've thrown away WordPerfect. I don't intend to use that anymore.

Do you run mostly in the Mac emulation mode or Atari mode?

It turns out that I use the Mac mode very little—mainly because it is not quite perfected for the TT yet. I can run some things off the floppy disk, but it does not recognize the internal hard drive of the TT. I sent David Small a FAX to see if I can be high on his list of people who desperately need his first 3.1 software, but I don't have any idea when this will be out.

Do you have other Macs in the office?

All of our secretaries use Macs, and at least half of the people in the building who have personal computers on their desks have Macs. We have very few IBM PC-type machines left. Most everybody else uses Sun workstations or MicroVAXes.

What are your priority uses once you get Mac emulation working?

The main purpose is to take work that has been published previously that is on our secretaries' Macs (text or graphics or both) and bring it into PageStream, the desktop publishing software for the Atari.

Is PageStream your principal program for the TT030?

Yes, I use PageStream, and then Wordflair for the simpler documents. I currently use Easy Draw for the graphics, but I am in the market for a higher performing graphics program. I just got the demo for Avant Vector and am checking that out while inquiring about some of the others. I also use LDW Power. Those are the programs that I am going to be using and am already using for any publishing work I do. We write a couple of papers a year. I need to get them printed on our QMS PS410 PostScript printer and photo-ready for publishers. I should also mention that I communicate with all of NASA's Cray and VAX computer systems using my Atari as a terminal. I use Uniterm, a public domain program. It's one of the best I've seen. It's especially useful for me because it emulates the necessary terminals and the VAX-type keyboard very well.

Are you pleased with PageStream?

Yes, I am. The more I use it, the more I learn about it. I haven't actually gone all the way through the document that we are working on now, but I am getting better with it. I really do like it. There are a couple little features that it would be nice to add, but I think those have already been brought up to Soft-Logik.

How do other people react when they come by and see you working on an Atari?

The people in my group have all been exposed to Atari for three or four years now. They know what it can do, and they're really pleased. The outsiders who walk in and see this on my desk kind of give me an odd look. The experienced users, the so-called experts, just make a few comments and ask "Why would you buy such a thing as that? Why didn't you buy a Mac?" Others are more open minded about it—the secretaries in particular. They say, "Oh, that's nice. It looks a lot like a Mac." The bottom line is that I usually tell them it does most everything as good as a Mac or any other computer for about half the price.

The purchasers at NASA must be pleased with the savings.

I don't know that they pay close attention to the good deal you think you're giving them. It doesn't matter. I'm happy. They're happy. That's all that counts.

Are you networked to any other systems?

The TT030 itself is not networked to anything. When we get some software to use the Appletalk LAN port, depending on how good the software is, I can connect it to our secretaries' network of Macs.

What is the future for you and your TT030. Will you upgrade to UNIX?

I probably wouldn't—although, we use a lot of Sun workstations here. We have Ethernet networks in the building that are connected to NASA. If I were to get an Ethernet card and software that would allow me to use this as an X-Windows terminal, that's probably the only reason I would get UNIX. All of our Suns are switching over to X-Windows. The TT would not do me very much good as a stand-alone UNIX machine if it does not have a FORTRAN compiler.

Are you generally pleased with the system?

Yes, I am. It runs good, looks good. Compared to the 1040ST's color monitor, this is wonderful. I would probably throw away the Macintosh emulator completely if I could get two more pieces of high-end graphic software for this machine.

One is something that does graphs, ala Cricket Graph. It allows you to input numbers, essentially like a spreadsheet without calculations, and then generate all kinds of graphs. It lets you annotate them with different fonts, and also freehand in some lines. I need that for a lot of my technical reports. I haven't been able to find anything like that for the Atari.

The other thing I need is something to represent equations for technical reports. My favorite program of this type on the Mac is called the Expressionist. It's just a desk accessory that lets you produce the functions and symbols necessary for an equation. Once you've finished entering the equation, it lets you cut it and insert it into your document. As a desk accessory, even a stand-alone program, if you could just create a metafile or something that could be imported into at least a few of the word processing programs on the TT, that would help.

Do you see your office buying more TTs in the future?

In my immediate group, there are four people in this Lockheed building and another three or four that are one-half mile away at NASA. I think that if the next Spectre software behaves as well as most MacIIs behave, the TT is a real good candidate for our future Mac purchases. I know of only one other person in the group who would be interested in buying one as an Atari. He has used this one some. Our NASA division is switching over to Suns almost exclusively. We don't care that much for the desktop publishing capabilities of the Sun—what I've seen of it so far. So, we will be keeping at least one machine like this around to do our reports on. I guess, it all depends. If we demonstrate that this thing just runs circles around the Sun for desktop publishing, then perhaps we will get at least one more.

Might you upgrade your 1040STs with accelerators?

I don't think so. We already upgraded them to 2.5 megabytes. They're almost four years old now. After using TOS 3.05 on the TT, I almost prefer it to NeoDesk—which we all use here. In any future machines I would like to see that new TOS. If we are going to buy more, they will probably be TTs.

Do you have any final thoughts?

I can tell you that this is probably 1000 percent more reliable out of the box than any Mac we purchased here. When our secretaries first converted to Macs, we bought, I think, eight machines. Four of them had to be sent back because they just didn't work. Over the year, the other four have had some kind of a failure that required a maintenance person to come in to fix it. We haven't had any problems with any of the Ataris we have here—except the one 1040ST that got flooded when the roof leaked.

A Talk with Run PC Owner

Komives: What attracts you to a market which many of your competitors see to be dying?

Jon Willig: Primarily, it's the hardware. As a longtime Atari user myself, I always realized what an incredible value Atari computers have always been, and still are. As an educational dealer, I can offer my customers a complete, powerful and user-friendly system for under $600. No other system we sell [Jon also handles some PC clones] can offer the same amount of functionality for under $1000.

I also feel very good about the reliability of the product. I have experienced far fewer problems with Atari equipment than any other alternative on the market. Finally, the Atari is a much simpler platform to support—in terms of the time we must dedicate to

Put the Power of the Latest Computer and Color Desktop Publishing Technology to Work for You!

What Is Desktop Publishing?

There's a revolution going on out there. In the past, you had to pay top dollar for B&W and full-color, camera-ready copy. Traditional typesetting and paste-up was a time-consuming and expensive process.

Today, Desktop Publishing (DTP) software has the power and flexibility to give you low-cost, high-quality documents, even in glorious full color!

The personal computer of today can run circles around the mainframes of ten, or even five, years ago. The DTP software of today equals or surpasses the capabilities of today's mainframe page design software.

There's a revolution going on out there, and Desktop Publishing is winning.

Use the Power!

At Unicorn Publications, we put the power of today's personal computer and desktop publishing software to work for you.

From textual reports to full-color, graphic-oriented documents, we can give you quality output that pleases the eye and the pocketbook.

Join the revolution today!

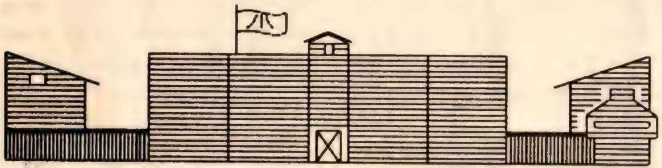
AAAUA ATARI 8-BIT USER GROUP

PRESIDENTIAL PONDERINGS by Alvan Sherrill

Is your user group a club? It comes so trippingly off the tongue. Our Club. The Club. The Club's PD Library. The Club's newsletter. It is not uncommon. Even our beloved AIM uses "participating clubs" and "participating user groups" interchangably. Are "club" and "group" synonymous? I would suggest that they are not! And AAAUA is certainly a club in the accepted sense of the word. If the term "club" did not detract from what AAAUA is and does, I would let it go as being inconsequential. However, it is inconsequential, as I shall attempt to illustrate. I say this in the full recognition that the word "club" is firmly entrenched in the vocabulary of most user groups and it may prove difficult to dislodge. "Club" is even a part of some user group's name. Each user group will have to decide if "club" describes their activities or not and whether they decide to eliminate the word in reference to their group or not. Those with "Club" as part of their name may have a harder choice.

Webster describes a club as "...a group of people associated for a COMMON PURPOSE OR MUTUAL ADVANTAGE (emphasis mine) usually in an organization that meets regularly:..."Sounds ok so far. Let's see, we have sewing clubs, bridge clubs, stamp clubs, book clubs and ball clubs. Do we fit in this category? Are these the limits of our objectives? From my own experience which appears to be supported by references, "club" seems to apply to groups organized primarily for the mutual benefit of its members. Our objectives are for the mutual benefit of our members, but, we also have objectives which place us on a higher plane than a self-serving "club". Our objectives include providing a service to the community and society. We welcome the opportunity to speak before civic and educational organizations and welcome young members into our user group to help them not only to better understand their computers, but also improve themselves in a number of personal ways such as language, art, music, writing, public speaking, mathematics, and other academic disciplines. We support the family and help provide guidance and assistance to the members. I therefore submit that we do what a club does, but a whole lot more! We are an educational association or group dedicated to community service and education, with our interests and activities centered around computers, specifically the Atari computer. Each user group may want to consider similar objectives. In short, the objectives of AAAUA include, but are not limited to the study and support of the Atari 8-bit computer. The Alamo Area Atari User Association is a user group. We are not a club. If this describes YOUR user group, will you join me in purging the word "club" from our vocabulary in referrence to a computer user group?



ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

ACORN—The Atari Computer Owners Resource Network of Ft. Wayne Indiana

The January meeting began with additional nominatons for offices and names were added and withdrawn for several of the offices. After the additional nominations voting was done by a show of hands after the nominees left the room.

The following is the results of the elections.

President	Bob Kelley
Vice-President	Barry Tracy
Treasurer	Kim Stahn
8-Bit Librarian	Phil Volkert
16-Bit Librarian	Jim Keller
Secretary/Newsletter	Mark Garrison

Once the formal business was out of the way the remainder of the meeting was the annual Gamefest. Several of the members brought machines to the meeting. There were nine STs and one 8-bit computer being used. Six of the STs were used for MIDI MAZE II and the original MIDI MAZE. The other computers were used for head to head FLIGHT OF THE INTRUDER, and assorted single player games. Karl Fadus brought an animation of a police chase that I believe was done using DELUXE PAINT.

Atari Exchange of Louisville

AEL—PO BOX 34183 LOUISVILLE KY 40232

Atari Scene! BBS (502) 456-4292

Dues: $20/yr per family

DC (8-bit) Sig meetings 1st Wednesday, 7:30 P.M., Leader: Rich Link

ASTRO (ST) Sig meetings 4th Wednesday, 7:30 P.M., Leader: Jan Wilt

Mailed subscriptions to AELien Transmissions, our newsletter, are available for $1.74/yr. (6 issues) for members.

ASTMUM
ATARI ST/MEGA USERS
(Montreal)

Our users' group consists of MIDI musicians, composers, videographers, artists, writers, technicians, students, teachers and business people. We also welcome new members, interested in learning about the ST/MEGA (even STE, MEGA STE and TT) models, and their applications, before purchasing.

Founded in 1987, ASTMUM provides its productivity-minded members with technical support, training and emergency assistance (24-Hour, Repair Hotline), laser printing and graphics services, as well as discounts (through participating dealers) on original software, computer hardware and music industry-related equipment.

To benefit its members, and the visiting public, our group has participated in these shows and expositions:

CEGEP Rosemont AtariFest, Montreal, September '88 WORLD OF ATARI, Dearborn, MI USA, June '89 PRODUCTION '90, Montreal, May '90 SIIM '90, Montreal, June '90 Windsor/Detroit International AtariFest, May '91 PRODUCTION '91, Montreal, June '91 SIIM '91, Montreal, June '91 WAACE AtariFest '91, Reston, VA USA, October '91 Chicago ComputerFest, Rosemont, IL USA, November '91

We have kept our members informed of Atari's progress on their most recent models (TT, MEGA STE, ST Book and STylus) through our large periodicals library, videotaped show-tours and interviews with software and hardware developers.

Encouraging members to form special interest groups, we hold monthly meetings (usually the last Sunday of each month) and offer seminars and demonstrations.

Some members teach others, in "hands-on" recording studio environments, at generous discounts. Masters of piano tuning, computer repair and instrument restoration work their magic. Incoming members are impressed by the efficacy with which our specialists troubleshoot the previously unsolvable. Even singers find help for their vocal problems!

In addition to helping ASTMUM musicians market their CDs, LPs and cassettes, at exhibitions and retail outlets, we have assembled a "sampler" cassette highlighting some of their work. You can order this extraordinary, chromium dioxide wonder (ASTMUMusic Sampler, '91-'92) for $12.00 postpaid! Please specify your choice of noise reduction: Dolby B, Dolby C, DBX or Super D (this list will get longer because at least one, new, noise reduction system will be introduced this year). Make your Money Order (in U.S. dollars if you live in the U.S.A.) payable to K. Carter-Morgan and send it to our address, below. Your return address should be complete and clearly printed.

If you use your Atari in creating or performing music, and would like help in launching and publicizing an independent release, our group may be just the ticket.

Membership information, advice, product list and sampler cassettes may be obtained by writing to: ASTMUM, Attn: K. Carter-Morgan P.O. Box 966, Station B Montreal, PQ Canada H3B 3K5 or by phoning (514) 272-6631 (voice only).

Executive Exhortations by Kest Carter-Morgan:

First, let me point out that, due to space considerations, my Chicago ComputerFest article, "MIDI IN THE MIDST", is slated to continue in the April issue.

Second, I want to thank those ASTMUM members who, in recent months, have given their time and energy in making stimulating and informative demonstrations, as well as assisting in other club functions.

Third, we are forming a Montreal AtariFest committee in order to rev the FestEngine up to speed. However, it needs fuel... so keep those cards and letters coming!

Adieu for now!

KCM (ASTMUM)

BRAG ST

Buffalo Region Atari Group for ST's

Minutes of the December 19, 1991 General Meeting

By Dane Stegman

The meeting was open by Chairman Mark Pierro at 7:35 pm. This was our annual Christmas Party. We had Christmas cookies and Egg Nog and Gum balls to hand out. We also had demos of THE SNOWMAN and SNOWBALL FIGHT by Codehead Software. MIDIMAZE games were played and people who brought their LYNX's started to play them to show the new model (LYNX II) and the original LYNX.

After the demos were shown, MIDIMAZE games and LYNX battles, we had our door prize raffle. Our first winner was Karl Miller (a new member) who won a copy holder. Our second winner was Michael R. Burkley who won a pack of Static Free Wipes for dusting off your monitor and our third winner was John Forgettee who won a 3 1/2 Diskette Storage Box. Then we had our regular raffle and our winner was Carl Barron who won a Beetle Mouse.

CUSTUG Champaign-Urbana ST Users Group

The Champaign-Urbana ST User's Group (CUSTUG) meets at 7pm on the second wednesday of each month in the Auditorium of the Urbana Free Library at the corner of Elm and Race streets in Urbana, IL. Membership dues include a subscription to AIM and ATARIUSER magazines, as well as access to our PD software library. All who are interested in the ATARI ST & TT computers are welcome.

Lee Johnson	President
Menno Rapson	Vice-President
Bill Magro	Secretary/Treasurer
Tim Brumleve	PD Librarian

Contact address: CUSTUG, PO BOX 3442, Champaign, IL 61826-3442 Contact telephone #: 217-356-7916

Layton ACE of Utah

The Layton Atari Computer Enthusiasts (L.A.C.E.) membership cost $20 per year. Privileges include the AIM Monthly Magazine, access to the 8-Bit and ST club libraries, monthly meetings, monthly AIM public domain disks, free issue of AtariUser Magazine (available at club meetings), help and friendship. If you are presently not a LACE Club member and wish to join contact the one of following persons or write to LACE, c/o Irwin Brooks, 3897 South 2275 West, Roy, UT 84067 or call (801) 731-1516.

Your 1992 elected L.A.C.E. Club Officers are:

Marshal Walker,	President	(801)545-7152
Lee Hatchell,	Vice President	(801)776-6687
Quhid Izatt,	Secretary/Treas	(801)544-4399
Richard Clark,	8-Bit Librarian	(801)825-5823
Mark Seegmiller,	ST Librarian	(801)773-8555
Dave Young,	Publicity Co	(801)776-6273
Irwin Brooks,	Publications Co	(801)731-1516

The L.A.C.E. Club Meets in the basement of the Clearfield Library every second Wednesday of the month at 7:00 p.m. Mark your calendars for the next three meetings. March 11, April 8, and May 13, 1992. SEE YOU THERE!!!

If anyone asks, tell 'em you saw their ad in AIM!

P3ACE

The Prez Sez by Steven Leser

Well, it has been an eventful first month in office. Due to a huge amount of expenditures in late 1991, the club's treasury was getting pretty low. We had an officers meeting to discuss ways to improve our cash situation. One of the things we came up with is that we would like to raise the dues to $20 per family. We have looked around at other users groups and discovered that we were among the only people charging less than $20 so we didnt feel too bad about the increase. We refuse to raise dues without a corresponding increase in services however! And, with that in mind, the SIG vice Presidents are redoubling their efforts to bring in more and better guest speakers, the Librarians are beefing up the size, and quality of offerings, and the BBS SysOp (me) is cleaning up and providing the BBS with a more polished look. Along with increasing revenue, we have decreased expenditures by trimming away some of the fat. These measures should put the club back into good economic health by mid-year. (Yuck, all of this economic talk makes me feel more like a U.S. president than a club president!)

The other thing that has kept me extraordinarily busy is that our treasurer Rick Mount has been away for the past few weeks, and I have temporarily taken over his duties as well. Talk about busy!

In one of my first few trips to the mailbox, we got a letter from a gentleman in Algeria wanting to joining the club! Neat! I will have to get a membership form and such out to him right away! Hey, AIM how many magazines do you get to send to Algeria???

Anyway, the presidency has been a tough job, as I expected it to be, but a heck of a lot of fun too! Don't forget to call Laser BBS at (719) 527-1374. We have a qwickmail system that allows you to download your new messages, and read and reply to them offline! (Neat for all but especially you long distance callers, eh?)

ST SIG Notes by Terry Quinn

There was no December ST SIG meeting so there isn't much to report. We will be having a demo of the new club BBS and the qwickmail features at an upcoming SIG meeting.

8-Bit Tid Bits by Rick Reaser

With the threat of a heavy snow, it was a wonder that anyone even showed up for the January 8-bit SIG meeting. We covered two basic items -- Selected educational programs and the new library catalog program we bought.

First we looked at a fascinating offering by Dorsett Educational Systems. It consists of a cartridge and a cassette tape. The basic program is on the cartridge, while the lessons are on cassettes. The cassettes use both tracks, one for data, which is put onto the screen and the other for voice which talks you through the lesson. Each course consists of 16 lessons or cassettes and costs $39.95 ($2.50 per 30 minute lesson). If you are interested, you can call Dorsett at (800) 843-5242.

Next, we looked at A+ Spelling by American Educational Computer, available from American Technavision. I use this program every week with my own first grader. In addition to providing its own spelling lists, up to eighth grade level, you can also type in your child's weekly spelling list from school along with a sentence using the words and misspellings. It is a great program with tons of flexibility. We also looked at some Public Domain educational programs. Some were good others were dogs. This was the lead in to a demonstration of the new disk cataloging program we bought, The File Information Program. We developed short program descriptions and used the disk that the PD educational programs were on as part of the demonstration.

The File Information Program was written by a member of the Denver Atari Club, Larry Richardson. It was written in Action! specifically for club 8-bit disk librarians. It has lots of neat features. It can read the program titles directly off the disk and also allows you to add a short description of the program as well. If now someone could only figure a way to combine the the features of SAGECAT with this excellent program. The program is $12.50, shareware. We saw it advertised in the November AIM which led us to buy it. Call the Denver Clubs BBS (303) 343-2956 and leave E-mail for Larry if you are interested. Or see our 8-bit Librarian, Roger Meston, for a demo.

Editor E-Mail by Sam Cherry

We've still got 3 1/2 inch disks available for 40 cents each or $8.00 per pack of 25. New 5 1/4 inch disks are also available for 30 cents each. If you have any questions or would like to put in a group order for labels or disks, please contact me at my new number (719) 598-7309.

Be sure to let us know if you change your address so you can continue to receive AIM. If you do move and want to continue to receive AIM, you need to tell the postman that you will pay for the forwarding of third class mail. Failing that, we always get a few extra issues of AIM mailed to the club P.O. Box in case the postman loses your copy or there is a mix up somewhere. Please check your mailing label to see if your dues are due.

See you at the next SIG meeting!

PHAST

Well, the first PHAST meeting of 1992 has come and gone. The meeting started out a little slow with only a handful of members showing up at the 10 am starting time. Somewhere around 10:40 we had around 19 members present.

The meeting started with a discussion of what the user could expect from Atari and other developers as far as the 1.44 Meg Kits and the TEC board was concerned. This discussion was then followed by a discussion and demonstration of the PHAST library by our librarian Dave Thorson. Dave talked about what was in the library and demonstrated some of the software found in the library such as Color Space, and a few other games.

Once Dave had finished with the library, our VP, informed the club that our only local dealer Computer Works was dropping the Atari and Amiga line completely. Although we will not have a local store to go to, we will have a dealer. That dealer is Richard Phillips a VAR who talked for about 20 minutes on what he had to offer our club and the Arizona community in general.Several people expressed concern about being able to get upgrades, and repairs done on their ST/STEs and our VP explained that Cory Chapman is now doing repairs, upgrades, etc... for very reasonable prices. Afterwards Brien King, our VP, gave a very informative demonstration of the new STereo Replay digitizing off of a CD player.

Once this demo was completed our President, Mike Aubrey, set up and demonstrated his new SLM605 Laser printer and his new T25 Accelerator made by Jim Allen of FAST Technologies. Needless to say, both pieces of hardware were very impressive. During the demonstrations Mike interjected several informative tidbits about Atari and the Atari community in general. At the end of the meeting everyone gathered up front to get a closer look at the equipment, get disks from the library and just to chat.

President Michael Aubrey (602) 870-8360
Vice President Brien King (602) 841-7136
Recording Secretary Adam Ceton (602) 266-2128
Treasurer Wayne Myers (602) 788-5165
Disk Librarian Dave Thorson (602) 954-6033
Cory Chapman (602) 246-6144
Richard Phillips at Analytical Computer Solutions (602) 780-4717

Our Local BBSes are: ST Base (official Club BBS) (602) 285-9246
RDS BBS (VP's BBS) (602) 841-7196
Wild Thing BBS (Recording Secretary) (602) 277-8225

RACC
ROCKFORD ATARI COMPUTER CLUB

WE'RE NOT JUST PLAYING GAMES ANYMORE!

New at RACC & LCACE

Our XANTH store has a new location. Xanth Software 1957 Harlem Road Loves Park, IL 61111 (815) 633-8300

Andy Learner has relocated in Milwaukee, and has a job, a new birthday, and is now a member of MILATARI. George Luhman has completed the enormous job of cataloging all of the 8 bit library disks, and has them all on a Disk Database. Call the BBS 815 226-2388 for club information. This is operated by his 2 boys, (HANDLES) King Arthur and Zethan. They have recently remodeled and relocated their BBS in their basement. Things keep growing and needing more room. And the calls keep coming from INDIA and other far away places.

RACC Jan. 18th meeting will have been about "Word Processing. RACC Feb. 15th meeting is scheduled to be "DESK TOP PUBLISHING". And we finally got a newsletter published. (Thanks RAY). Ray Smith our EDITOR is resigning from the ST Librarian. Dennis Renner is working hard on getting his new Migraph OCR and scanner up and running. Dennis is scheduled to demonstrate this at the Feb. 8 LCACE meeting. In this situation, reading text is more difficult than writing it.

RACC is scheduled to provide the program for the LCACE March 14 meeting in Gurnee. Come and a see the Terri, Dennis and Jake show on Educational Programs. Terri, Educational Program Design; Dennis, Transformer 8 bit to ST; Jake, 8 bit Basic Programmer. This will be a shortened version of the Seminar that got bumped from the LCACE show in Chicago.

Teachers welcome.

Sincerely,
H. Jake Olbrich

R.A.C.E.

Pres. Lewis Midyette 828-4319
Vice Pres. Eric Schofield 851-5134
Secretary Don Nelson 942-2764
St Librarian Tony Manino 851-8092
8-bit Librarian Arthur Katz 881-0247
Treasurer Robert Yates 552-7053
BBS SYSOP Robert Yates 552-7053
Galaxy BBS 552-0974

Well, so far the year is going very great, our attendance has been very good. We have had several new members, a few of these have been 8 biters. We are always happy to expand our group. So far this year we have covered Pagestream 2.1, Terminal programs,and this month we will be talking about data base programs. The next meeting will be held on Wednesday March 18that Richard B. Harrison Library on Newbern ave. Club dues are $20/ year which provides access to the Club BBS, subscription to AIM, access to the club Library. If you have any questions call Lewis Midyette 828-4319.

SCAT SUBURBAN CHICAGO ATARIANS
AN INDEPENDENT COMPUTER USERS GROUP

February 1992 SCAT club news.

Meeting on February 1, 1992, the demo will be an Atari TT with IBM and Mac emulators. We as a club have not had a production TT at one of our meeting or looked at a TT in great detail. Greg LaBrec, who works for Atari in lombard, did bring in a pre-production model in the spring of 1991. The computer being brought to the February meeting is owned by a club member.

The March 7, 1992 meeting will include a demo of an IBM program from Parsons titled Tax Edge. Al Conley will demo this program. He will run the program using PC Ditto II installed on an Atari 1040ST. I have seem this program run and it is impressive. This program also has the capability of sending by modem the tax forms to the IRS.

On tap for the April 4, 1992 meeting will be GAMES. We will have 8bit, 16bit and LYNX games. The titles have not been put in stone, but I am sure there will be something for everyone who attends. The May 2, 1992 meeting will feature the Portfolio hand held computer.

All meeting will be in the K building College of DuPage. I will try and get room K157.

A reminder from the Officers, Members dues of 20 dollars for 1992 are now payable since most membership runs out in March. If you can not come to the meeting please send the dues to our mail Box in Roselle. Hope to see you at the meetings.

Alvin Riesbeck, President

San Diego Atari Computer Enthusiasts

General Meetings are the 3rd Monday of each month at the North Park Recreation Center Social Room, 4044 Idaho Street at 7pm. ST/8-bit workshop meetings are on the 1st Thursday of each month at the North Park Adult Center, 2719 Howard Street at 7 pm. All meetings are open to the public. Annual SDACE subscription dues are $18 which includes increased BBS access, AIM subscription, SDACE newsletter subscription, and reduced rates on the Disk of the Month.

SDACE's address is PO Box 900076, San Diego, Ca 92190.

President	Dan Phillips (619) 462-1289
Vice President	Dean Smith (619) 582-6749

BBS - 24hrs, 300-2400 baud, 80 MB (619)689-8157

Back-to-back federal holidays (Martin Luther King Jr. Birthday and Presidents' Day) have forced us to combine our 8-bit and ST meetings for January and February. Despite the misgivings of both groups, there has been no culture shock as both 8-bitters and ST enthusiasts were forced to confront the fact that the other's computer is a very capable machine. Of course, those of us fortunate enough to own both could have told them that!

San Diego ComputorEdge magazine, a local MS-DOS-oriented publication, has asked SDACE to man several booths at the planned first San Diego Computer Fair tentatively slated for September. Members will spend the next six months planning how to put our best foot forward, and we expect to have both our ST/Mega/TT and 400/800/XL/XE platforms represented in strength. It wil be an exciting opportunity to bring the quality of Atari products before an unsuspecting public.

ComputorEdge has also been giving Atari unaccustomed attention of late, with articles detailing the future of Atari, an overview of Atari-compatible joysticks, and a history and description of Atari computers.

Beginning in March, we will revert to having two meetings monthly, on the first Thursday and third Monday. Hope to see you there!

SEVAC

SOUTHEAST VALLEY ATARI CONNECTION

The South East Valley Atari Connection meets the third Saturday of each month at the Dobson Ranch branch of the Mesa Public Library, 2425 S. Dobson Rd. Depending on meeting room availability, meetings usually begin at 10 a.m. Please call a club officer for exact time. Yearly membership is $12.00. Membership includes reduced prices on PD ST and 8-bit software libraries, Atari Interface Magazine, and club bbs.

President	Dennis LaFontaine	
Vice President	John Rojewski	(602)978-2362
Secretary	Marc Dyer	(602)897-0314
Treasurer	Lee Whiteside	(602)962-9415
BBS 24hrs, 2400bd, 70md		(602)833-9216

STAG
Saginaw / Tri-City
Atari User Group
"where the deer and Atarians play"
ST

The Saginaw/Tri-City Atari User Group meets the 2nd Saturday of the month, at 9 am, at the Rudy Zauel Memorial Library, on the corner of Center and Shattuck in Saginaw Township, Michigan. Upcoming meetings are January 11th, 1992, February 8th, 1992, March 14th, 1992, and April 11th, 1992. NOTE: We communicate by postcard with our members before each meeting to confirm the location and time of the meetings.

President	Bryant LaFreniere	(517)835-2234
ST Librarian	Jim Fleming	793-9792
Treasurer/Secretary	Marty Schmidt	792-6029
8 Bit Librarian	Ted Beauchamp	686-8872

Club dues are still only $20.00, which provides support for both the 8 Bit and ST, and full access to the club's Public Domain library, along with a year's subscription to the Atari Interface Magazine. PD disks are $3 for a double-sided disk packed full of goodies (2 for $5, what a bargain!). Check your mailing label, if you need to renew, (or haven't joined us yet!). A free PD disk is included with each new membership or renewal! DO IT NOW!

At the JANUARY MEETING:Only 5 people were present at the library for the meeting. Various members will call some inactive members to see if we can get the meeting up to at least 10 people. The people at the meeting enjoyed some good conversation on Atari-related news and advice. I hope we can get more people coming to the meeting because it is discouraging and disappointing for the people attending the meeting, especially the equipment volunteers who had to disconnect and lug their computer equipment to the meeting for nothing.

In FEBRUARY: We will decide on an agenda before the meeting. We will communicate equipment volunteers and the agenda of the meeting by a note in the postcard sent to the members before the meeting.

WAUG

WAUG GENERAL MEETING MINUTES 1-14-92

The January WAUG meeting wasn't as well attended as we had hoped that it would be. Our topics that evening were Portfolio and emulators. Our guest speaker was unable to attend owing to the weather, so Mike O. began the meeting with a demo of Spectre GCR running on our club STE. When started, Spectre lets you configure the amount of memory used for Mac emulation, the type of printer (including Atari Laser), SCSI device number and other parameters for any attached hard disks, and whether or not sound is on (Spectre slows down considerably for sound). Mike showed us around the ST-like Mac HFS file system . The first Mac program that he ran was Speedometer, which thought that it was running on a Mac with 11% faster CPU speed, 94% faster disk access, and an overall rating 25% faster than a Mac Plus. Mike's own ST with an ICD Adspeed accelerator reports that it is 94% faster overall than a Mac Plus.

The X10 controller software for Mac that was demonstrated next was a far cry from the rudimentary X10 software available for the ST, so I guess that it's possible that maybe some Mac software can be worthwhile. The Mac version came complete with configurable MacPaint rooms and fixtures that could be easily programmed to do different things at times on different days. While we would probably have been more impressed by seeing Spectre run on the TT that was supposed to be at the meeting, Mike did a very good job of giving us an idea of what this emulator was capable of.

President Dave B. brought out the WAUG SX212 modem complete with Vanterm software and announced that it would be made available for any members who wished to try it out on loan. He did tell us that the Black Box hard drive interface for our 8 bit did in fact arrive, but our 130XE is still out for repairs.

Next months meeting will feature reviews of UIS III and the ST graphic program, Chronos 3D. On the schedule for March is educational programs and Dave solicited both demos and requests for this meeting from the assembled membership. April's fare will be telecom as there have been a number of new programs that have come on the market as well as the fact that KA9Q/Internet was finally figured out and put to use by some of our members. Since he did such a fine job with the emulator portion of the meeting, Mike O. also got stuck with doing the Portfolio portion of the meeting. Since it would be rather difficult to show the Portfolio's tiny screen to anyone further away than a couple of feet; its capabilities as a palmtop computer and its ability to transfer files to and from other computers, including Mac and IBM, and its wide variety of programs were the subjects of Mike's presentation.

V.P. Craig Harvey announced to the meeting that the next major Atari show would be in Toronto on April 4th and 5th. He also made available some IAAD brochures for anyone who was interested.

Mike O. as ST Librarian and Ralph S. filling in as 8 bit Librarian gave brief synopses of the contents of the featured disks from our library.

The monthly drawing was held next with the program Trivia Arcade going to the 8 bit winner and UIS III and Epyx World Karate going to the ST winners.

While the STE was still hooked up and turned on Mike O. was kind enough to give us some short demos of some of the programs that he had compiled for the library. Two new utilities disks, a ready to run game disk with some very nice STOS programs, a new library disk with a faster and more flexible version of STD Cat, and three disks full of Portfolio programs were offered for sale.

The meeting was adjourned at 9:10 PM

Respectfully submitted,Dan Cable, Secretary

WIZARD'S ATTIC BBS (716) 681-1654

The Western New York Atari Users' Group, based in Buffalo, New York, serves owners of Atari ES computers (ight-bit chip, ixteen-bit addressing...Atari 400, 800, Xl, XE, and XEGS!). We meet on the first Thursday of each month at: Bacon Hall, Rm. 116 East Buffalo State College 1300 Elmwood Avenue Buffalo, NY

WNYAUG members receive subscriptions to the POKEY Newsletter Disk and Atari Interface Magazine, discounted prices on disks from the WNYAUG Software Library, and access to the WNYAUG members Only section on the Wizard's Attic BBS.

All correspondence is encouraged. Our address is as follows: WNYAUG, P.O. Box 59, Buffalo, NY 14216.

WESTERN NY ATARI USERS' GROUP NOVEMBER, 1991 MEETING MINUTES

The November, 1991 meeting of WNYAUG was called to order by Mike Husband, President, at 7:30 PM in Room 116E Bacon hall on the Buffalo State College campus. The November issues of AtariUser Magazine and the POKEY Newsletter Disk were distributed.

Mike noted that Unicorn Publishing had informed him that the group was in arrears on payments for Atari Interface Magazine as well. Dave indicated that he would check his records and take proper action.

Mike noted that it had been suggested some time ago that we hold a Swap Meet at one of our meetings, and that a combined Swap Meet/Christmas Party will be conducted at our December meeting. The group agreed on two rules, namely (1) that all software offered for sale must be original (NO illegal copies), and (2) that hardware is sold on an "as-is" basis but that it is preferable for hardware to be in working condition.

Wayne Maracle Sr. has been typing in articles from old hardcopy issues of the POKEY Newsletter which nobody seems to have on disk anymore. Wayne submitted the first fruits of his labors, a disk with articles from several 1983 and 1984 POKEY issues in ARC format, which he gave to John to be put on the group's hard drive and possibly reprinted in the new POKEY Newsletter Disk.

NOTICE TO ALL MEMBERS: If anyone has ANY articles from the hardcopy issues of POKEY on disk, please speak up!!! Not only will this help us build up our library of text articles, but it will also spare Wayne from doing a lot of needless typing.

New Business: Dave informed us that his records show a current balance of $548.06, with two checks outstanding.

Dave also announced that as a by-product of the group's purchase of floppy disks in bulk quantities for use by the Librarian and newsletter Editor, WNYAUG is now able to make 5-1/4" floppy diskettes available for sale to members at the low price of just $4.00 for a package of 10 disks with write-protect tabs included. This price is lower than any available locally, and several members took advantage of it at the meeting. Members who wish to purchase disks through WNYAUG should contact Dave at 875-5350.

John passed around a copy of a flyer he created using The Newsroom, advertising our upcoming Swap Meet/Christmas party. In order to maximize participation in this event, it was decided to extend mailing of this flyer to those former WNYAUG members that we are able to locate in the area. We were planning to contact ex-members anyway, so by doing this we will be killing two birds with one stone. John will compare listed addresses for former members with listings in the local telephone directory to come up with a list for the mailing.

Christine Hess advised us that she plans to contribute to the Swap Meet by baking Christmas cookies and offering them for sale by the dozen at the Swap Meet, then donating the profits to the group.

Program Demonstrations: Mike began the demo portion of the meeting by showing the group three different hockey game programs. The programs were displayed in chronological order from oldest to newest so that we could observe how the programs became more sophisticated as programmers' abilities improved with time.

The first program was simply titled "Hockey" (Gamma Software, 1981). This game can be played by two players or, on a 400 or 800, four players. Each side has three skaters and a goaltender, and play on a rather small rink, both ends of which are visible on the screen throughout the game. Play action was nice for an early implementation of hockey on the Atari, but the graphics left something to be desired and there was no option for a single player to play against the computer.

The second program was "Major Hockey League" (Thorn EMI Video, 1983). This game also requires either two or four players, with no option for a single player to play against the computer. However, the graphics are somewhat better, and the game uses a full-length rink with horizontal scrolling to center the screen on the end of the rink that the puck is in. The play is better (you can even knock the opposing players down!), but the goaltenders in this game are TOTALLY USELESS: It is virtually impossible for the goalie to make a "save" in this game.

Following the hockey demos, Mike showed the Antic Graphics Converter, a utility that works with Graphics 7, 7-1/2, and 8 pictures. Mike is looking for artwork in this format, so if you have a collection of same, bring them to a meeting or F-Mail them to Wildstar on the Wizard's Attic.

(Editor's Note: I have a BASIC routine to display GR.8 and GR.9 pictures in a program, so if Mike gets any good response to his request, you may see the results in some future POKEYs.)

Following the break, Mike showed the Disk Of The Month, a collection of public domain game programs assembled by Librarian Betty Knab. After watching Mike attempt to play WORM.BAS we discovered that he is not the expert game player that he would like us to believe he is. Stick to Archon, Mike!

The Split Club drawing was then held. At last we have some genuine competition for Kevin Packard! Doug Tolkacz was this month's winner, which makes him 2-for-2 in Split Club drawings.

The meeting was adjourned at 10:15 PM, after which Dave did an informal demonstration of a home-built EPROM blower. A formal demo of this device had been planned, but was squeezed out due to time constraints. The formal demo of the EPROM blower will be presented at a future meeting.

November 8, 1991 John Kasupski, Secretary

WESTERN NY ATARI USERS' GROUP DECEMBER, 1991 MEETING MINUTES

The December, 1991 meeting of WNYAUG was called to order by Mike Husband, President, at 7:35 PM. The business portion of the meeting was limited, for two reasons, one being the fact that we wanted to conduct a Christmas party and Swap meet, and the second being that "Old Man Winter" picked our meeting date to rear his ugly head and dump some extremely rotten weather on us.

Those of us who did brave the elements, received the December issue of AtariUser Magazine and a copy of the POKEY Newsletter Disk, while Mike announced that there would be no January meeting because Buff State College was going to be closed on our regular meeting date.Our regular meeting for February will NOT be affected, there WILL be a regular meeting on February 6, 1992.

Treasurer Dave Shane reported that our account balance now stands at $820.81 with a few checks still outstanding. This balance also includes the refund for the club's 40Mb hard drive (The original died under warranty, and the dealer's replacement never had a chance to die because it didn't work when we received it!). We will now seek a suitable replacement.

The kickoff of the membership drive was discussed. Over the past month WNYAUG has mailed over a hundred letters to former members of the group to see if they are still interested in their Atari ES (8-bit) machines. We did get some favorable response from a few members, although the inclement weather definitely put a damper on most response we would have gotten in terms of people attending the meeting. However, we did get one new member immediately as a result of the letters we sent. Daniel Soborowski is again a member in good standing. Welcome Back! Dan works nights, but his wife and son attended the meeting and made some new acquaintances. We look forward to seeing the Soborowski family more often.

Copies of the 1991 WNYAUG Informative Survey were distributed. The purpose of this survey is chiefly to allow users of Atari ES (8-bit) equipment to provide us with feedback about the way in which they use their systems. The information we obtain will hopefully go a long way toward helping the officers plan meetings during the upcoming year, and so, all members who received the survey are urged to PLEASE complete them and get them back to the Secretary, either at the February meeting or in the mail.

Our SysOp, Don K!, confirmed what many of us had known for a few days already, namely that The Wizard's Attic BBS was temporarily down. The problem stems from a dead hard drive (like the flu, this seems to be going around nowadays), and Don hopes to have the board back online within a few days, although the capacity will be reduced until the dead drive his 40Mb MiniScribe) is repaired or replaced.

Business was then set aside while we took advantage of the free coffee and conducted the Swap Meet (such as it was, with the weather limiting the turnout). Among other things, an XEP-80 and AtariWriter Plus 80 changed hands, another member got a line on a Star SG-10 printer, another got Flight Simulator II (only to discover it won't run on an XF-551 drive...XF-551 owners WATCH OUT FOR THIS!), some more blank disks were sold through the group's bulk disk purchase offer (members may buy a package of 10 disks for $4.00), and the members got to exchange some small (and some not-so-small) talk as well.

A split club jackpot drawing was held, and your humble Secretary/Editor made off with the loot this time around, though the weather undoubtedly reduced the size of my "take" <grin>.

It has already been suggested that we try the Swap Meet idea again sometime this spring, when cold and snow are less likely to reduce participation as they did this time. If you think this is a good idea, let the officers know (the comments area in Section 4 of the 1991 Survey is a good way to do this).

Also, I noticed (too late) that the copies of the surveys handed out at the meetings were stapled together in the wrong order. Hopefully this won't confuse anyone too much. All the pages are there, but the second of the five pages should have been last. This merely proves that our Treasurer is human after all, despite what you may think when you see his computer system.The formal meeting was adjourned at about 9:40 PM. As usual, many of those in attendance stayed around awhile and visited with one another, exchanging ideas, information, bouquets, brickbats, and all the other neat stuff that you miss out on if you don't attend our meetings.

For many, this decision is voluntary. For others, it's mandatory - some members work nights and can't attend meetings. But this month, in two instances illness kept members from attending. Best wishes for a speedy recovery, therefore, to Christine Hess (A.K.A. Mother Goose), who's in K.M.H. recovering from acute bronchial pneumonia, and also to Kevin Packard (a.k.a. The PACK), the nature of whose illness is not known to me but whose presence was missed nonetheless.

December 6, 1991 J. Kasupski, Secretary

PRESIDENT'S NOTES by Mike Husband,

The Western New York Atari Users' Group will be having it's first ever (that I can remember) Great December Christmas Party and SWAP Meet. Having never been to one myself, I hope it is a great success. If we have a good turnout for this event, it WILL be so. Plus it should be a good time for all. More on this in next month's article.

We will be needing an audit in the future. What this entails is that the user group knows the whereabouts of all its equipment. The group just has to have it written down. The User Group has had many pieces of equipment misplaced over the years. I don't want to see equipment & things get misplaced like they have been a long time ago.

Our POKEY Newsletter Disk may be getting a little thinner, article wise that is. Our Secretary & POKEY Newsletter Editor has a work obligation that will impair his abilities to impart the same amount of his free time into the POKEY Newsletter. If no one pulls in the slack it might show. I am hoping that it won't.

I also would like to thank our POKEY Newsletter Editor for clearing up the misunderstanding about our licensing agreement with ICD and the POKEY Newsletter program.

Thursday, December 5,1991 our first annual Christmas Party and SWAP meet was held. We had a good turnout and a new member joined the club. The weather was awful. Next year it will be bigger and better.

I have been in contact with AIM magazine, we should all be getting an issue soon!!!

The Club received a package from DORSETT Education Systems, Inc., "The Talking Tapes that Teach". They sent the club a cartridge and a cassette tape. I tried to demonstrate them at the December Meeting. I needed an ATARI 410 or 1010 Cassette Recorder and did not have one. I will demonstrate The Dorsett Education System at the February 6,1992 meeting. DORSETT is closing out the Atari line of their inventory. I believe the club should add some of these fine products to our Library. The club can not get all the tapes but a few would be nice. I am going to be typing up an inventory list of the products which are still available.

John Kasupski, our Newsletter Editor and resident Writing Machine, did an outstanding job on the December Pokey Newsletter Disk.

I demonstrated three different hockey game programs at the November 7, 1991 meeting. There was some misinformation about these programs in the December POKEY Newsletter, November Meeting Minutes. I blame myself for the misinformation. I did not know our Secretary was taking notes and I forgot to mention some of the features of the Games. The first program was "Hockey" by Gamma Software, 1981). The second program was "Major Hockey League" (Thorn EMI Video, 1983). The third Program was "Showdown Hockey" by (Aussemware, 1991). I have an article which lists all the options available in each program.

An Atari User CALLED me from out of state wondering why the WIZARDS ATTIC BBS was consistently busy. I informed him that the BBS hard drive had crashed and was being repaired out in California. He informed me that the ATARI clubs in his area were hit hard by apathy. He gets AIM Magazine at his local bookstore which receives only TWO copies a MONTH!!!

I am looking for an electronics part called a THERMISTOR. It should decrease in resistance as the temperature increases. Many catalogs and manuals list the resistance at 25 degrees Celsius in Ohms, I do not know this value. I know that it MUST BE a 1 MEG THERMISTOR and have a range from -5 degrees Celsius to 45 degrees Celsius. Any help would be greatly apperciated in this quest.

(Note: Remember to KEEP the First Thursday in the Month of April OPEN on your Calendar. This will be the Western New York Atari Users' Group Second Annual (10th Year) Anniversary Party. It will be even better the second time around!!!))

I hope that one of our members and newest writers for the POKEY Newsletter Disk, Christine Hess, is feeling better after her run in with Acute Bronchitis and Pneumonia.

STAR TREK VI was GREAT!!!

teaching our customers how to get their new systems to fulfill the intended purpose. There is no disk-based operating system to fumble with, no multi-layer operating systems to install, no command line interface to contend with. It simply works. Most people purchase a computer to make their life easier, not more complicated.

Where do Atari computers fit into Run PC's product line?

Essentially, I see the Atari platform as a cost effective alternative to the Apple Mac or IBM clone in the general market—and the platform of choice in some specific market niches. The strengths of the Atari platform make it the logical choice in the music, desktop publishing and educational markets. That is not to say that the ST/TT is not capable of satisfying the needs of the general business market. On the contrary, we run the entire business on a MEGA ST4. However, segmenting the market based on your strengths is a fundamental marketing strategy, and one which I believe Atari is realizing.

In what areas do you use your ST to run your business?

The MEGA ST4 is used daily, mostly as a desktop publishing platform. This machine, along with an Atari SLM804 laser printer, a Migraph scanner, Calamus, PageStream and Touch-up, provides me with all the tools necessary to create professional camera-ready promotional materials. The MEGA is also used for all of our inventory control and invoicing.

What do you see in your future and Atari's?

I think with the introduction of the new products, and lower prices on current products, Atari is on the road to recovery. They have repositioned themselves and will be a major contender in the personal computer market. The dealer program has recently undergone reorganization, and I have found Atari to be very responsive. Both Atari's pricing and product elements are currently sound. It may take some time to rebuild the distribution system, but many new dealers are being added. The key will be to focus on specific markets—for both Atari and its dealers.

Bob Komives is a land-use planning consultant who has used Atari computers since 1980.

Greg Wrenn is a Staff Engineer with Lockheed Engineering and Sciences Company at NASA, Langley Research Center, and Jon Willigis the owner of Run PC, located at 524 W. Laurel #2, Fort Collins, CO 80521, (303) 493-5565, 1-800-326-2344.

Ralph Turner's Third Book of Atari ST Topics

Tom Brantmeier

Index Legalis has recently published Ralph Turner's third book of helpful information for Atari ST users. This third book, like his second one, covers a variety of all new topics in detail. Several of these new topics were of particular interest to me.

In his characteristically clear and concise style, he gives us the necessaries of laser printers, MIDI, modem use, file transfers, upgrading to TOS 1.4, Public Domain and Shareware software, an introduction to the Atari TT and Mega/STE, and a few miscellaneous topics (including an information packed "test" of what you know about the ST and Atari).

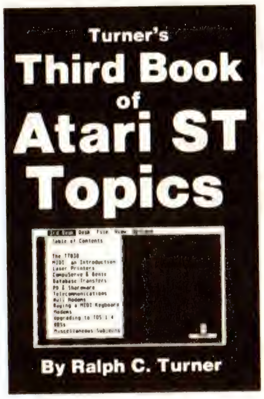
MIDI Chapters

I was particularly grateful to have so much well organized information about MIDI all in one place. Mr. Turner devotes three chapters to MIDI. The first is an introduction that clearly describes some important aspects of the subject. He starts you with a straightforward definition and a brief history of MIDI and then works you through "channels" to "reception modes." This chapter gives you a sound footing in MIDI from which to work.

The second chapter details what you need to get started and even works you through buying an electronic keyboard. This chapter is where you learn about "degree of polyphony," "multitimbral capability," and MIDI In, Out and Thru, among many other things.

The third chapter describes how to use a sequencing program step-by-step. The program Mr. Turner uses as an example is one of the best and most accessible 16-voice Public Domain sequencers available.

This is the one by Henry Cosh of England. Mr. Turner's concise description allows you to have a completed 4-track recording by the time you're through.



I have had my keyboard for a couple years, and though I had learned a great deal about it, I hadn't taken the time to learn all of the MIDI features. I mostly like to spend what little spare time I have in playing. Since the keyboard's MIDI instructions were sparse, I missed some of the less used MIDI features, until I read "Atari ST Topics."

TOS 1.4 Details

I am also very thankful for Mr. Turner's description of TOS 1.4. Nowhere else has the virtues of TOS 1.4 been so clearly delineated. My ST was in the shop getting a memory upgrade when I read this part of the book, and I immediately called and requested the TOS upgrade. Now that I have TOS 1.4, I love it!

Telecommunications

Telecommunications has always been one of the more daunting elements of computing. Mr. Turner presents four compelling reasons why someone would desire to get into telecommunications and he covers all the pertinent details from cables to baud rate. He explains modem settings, file transfer protocols and discusses other aspects of telecommunication programs.

To make you confident and make it perfectly clear, he runs you through a call to a bulletin board step-by-step. I've watched an experienced BBS user friend of mine call up a BBS for his Mac and saw him goof up the process twice, costing him five minutes in long distance charges. So, a hand-held walk-through is very comforting for a cost-conscious person like myself.

Although I like the detailed coverage of several topics in this book, and they were some that I was interested in, I would also have liked some coverage on the new products out for the ST. Like scanners and the new monitors, etc. There's a lot of variables in these products and they could add a lot to a person's computability. Unfortunately, at this time, the only place to find out about these products is in the ads.

Mr. Turner has an incredible facility to explain complex computer material in a way that a beginner can understand, yet he's thorough enough that experienced users will better understand what they're doing after reading his books. Mr. Turner has the ability to immerse himself in a subject and get to know it well. More importantly, he has the uncommon ability to express this understanding clearly and concisely. I think Mr. Turner's talents would be very much appreciated in writing the manuals for some commercial programs.

"Atari ST Topics" is certainly another important and highly readable addition to the library of any ST computer owner who wants to get more out of one of the most versatile computers on the market.

A Second Look

Jerry Belfor (FRAUG)

[This review first appeared in The Lily Pad, a publication of the Front Range Atari Users' Group (FRAUG) in Fort Collins, CO. Jerry Belfor is president of that club.]

I previously had the good fortune to review Ralph Turner's books "The Atari ST Book" (September, 1988 Lily Pad) and "Atari ST Subjects" (March, 1990 Lily Pad). After the second book, I thought Mr. Turner was done. After all, what else was there to write about?

What else? How about MIDI, modeming, and the differences between the TT, Mega STe, and the ST. All this, and more, can be found in Turner's "Third Book of Atari ST Topics."

This book, like the previous two, is written for the non-expert. The information is clear and understandable. I would especially recommend the book if you are new to either MIDI or modeming, as these two topics fill a total of eight of the 16 chapters in the book.

Included in the MIDI chapters are topics such as how MIDI and word processing are similar, a history and explanation of MIDI, how to get started in MIDI and how to buy a synthesizer. The modeming chapters include what a modem is, how to connect one, communication programs, terminal settings and information on connecting and using a general BBS and both CompuServe and GEnie. Wow!

But that's not all, folks. There is information on TOS 1.4, laser printers, transferring files between databases, and more. There is even a trivia quiz (which I did fair on) in the middle of the book for a nice break.

As I said in my previous reviews, I think Mr. Turner's first two books definitely belong on the bookshelf of all Atari ST users, and this book should be there also, especially for those interested in MIDI and/or modeming. The other topics covered are also of value and the book is certainly worth buying. Our favorite local Atari dealer, Run PC, even has it in stock.

CalAssistant

PageAssistant
For PageStream 2.1

DTP Help from Spar Systems

Bill Rayl

The included tips and hints can make you more productive and improve your layout skills. This fact alone makes the software well worth the purchase price.

Calamus and PageStream are two of the best desktop publishing packages available for any computer platform. But, for the "average" user, these programs can seem a bit intimidating. Both programs are very complex and powerful, but it takes a significant time investment to learn how to harness that power.

Spar Systems offers two desk accessories that can help you master PageStream or Calamus. These accessories give you a quick online reference to all the features hidden away in Calamus and PageStream, along with some very useful tips and hints for getting the most from your DTP package.

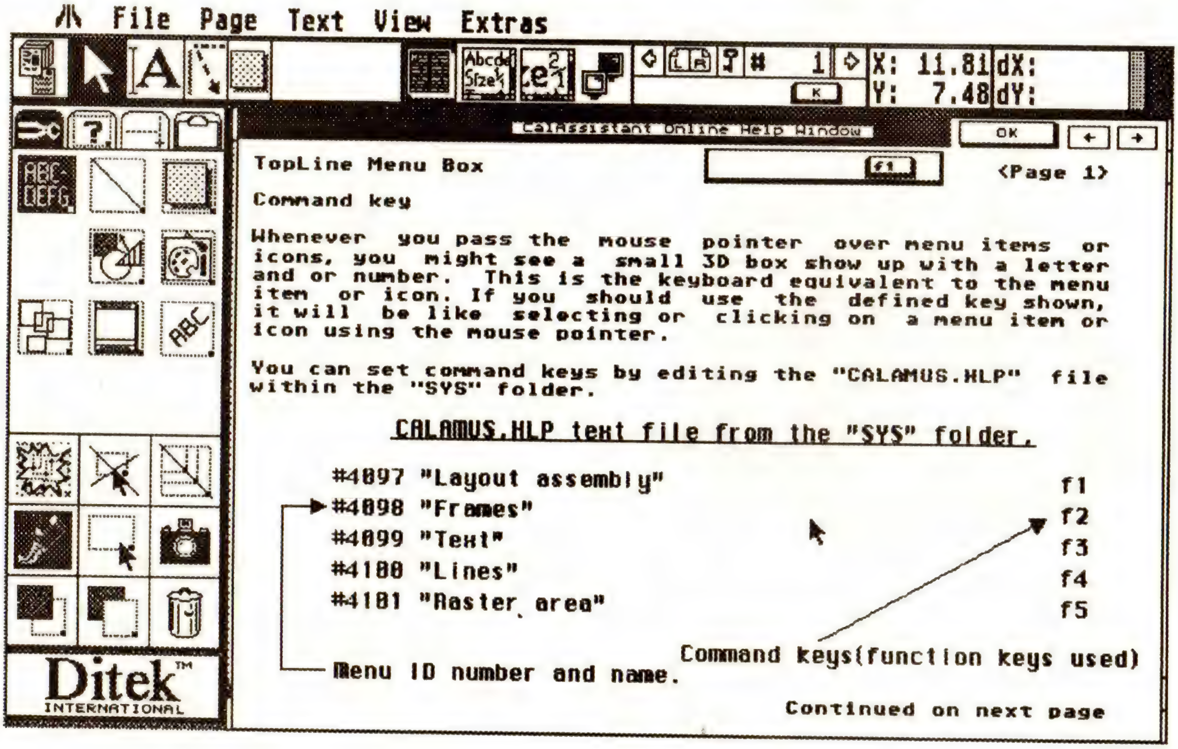
CalAssistant

Spar Systems first released CalAssistant in early 1991. Since then, the program has been updated several times, and a version for Calamus SL is currently in the works.

You can think of CalAssistant as an online manual for Calamus. As a desk accessory, CalAssistant is always available right when you need it—during your DTP session at the point you have a problem!

The software is very easy to install and a breeze to use. A system with 2MB of RAM and hard drive is highly recommended. CalAssistant can, however, be booted from floppy or used on even 512K systems. However, on low memory machines, you won't be able to use CalAssistant while in Calamus. CalAssistant takes up about 90K of memory—not much considering what you get! CalAssistant, like Calamus, only works in ST monochrome resolution. Unlike Calamus, however, CalAssistant does not support big screen monitors like the Moniterm.

CalAssistant is designed around a "submenu" approach similar to Calamus itself, only CalAssistant doesn't directly use the Calamus icons. Instead, you



TopLine Menu Box

Command key

Whenever you pass the mouse pointer over menu items or icons, you might see a small 3D box show up with a letter and or number. This is the keyboard equivalent to the menu item or icon. If you should use the defined key shown, it will be like selecting or clicking on a menu item or icon using the mouse pointer.

You can set command keys by editing the "CALAMUS.HLP" file within the "SYS" folder.

CALAMUS.HLP text file from the "SYS" folder.

```

select text items from a menu. Then, CalAssistant either presents you with textual and visual help for that item or takes you to a submenu.

The actual text items found on the submenus are based on the "Help Messages" defined within Calamus. In Calamus, these messages appear in the upper right corner of the screen, assuming you have Help Messages turned on.

Once you've traversed the submenus and selected the item for which you want help, CalAssistant displays one or more on-screen pages of text pertaining to your selection. Most of the time, the text is accompanied by graphics showing you the Calamus icon or illustrating some important point.

The text you're given is detailed. Usually, you are also given step-by-step instructions on how to best use the selected feature. Tips on how to save time are also included. At the end of each textual help, CalAssistant refers you to the exact page number(s) in the Calamus manual that you should turn to for more instruction.

The 20-page manual that comes with CalAssistant was created entirely in Calamus and includes an 8-page Calamus tutorial. The tutorial covers all the basics for creating a newsletter layout. It also takes you through the process of defining text columns and importing text and graphics.

CalAssistant comes with a number of useful CDK documents, PD/Shareware utilities and a complete Helvetica font set (regular, italic, bold and bold italic).

PageAssistant

For users of PageStream 2.1, Spar Systems offers PageAssistant. PageAssistant is similar in function to CalAssistant, as one would probably expect.

However, PageAssistant also has a number of additional features over CalAssistant. One of those extras is a built-in print function for obtaining hardcopy reference sheets of the help screens. PageAssistant comes with printer drivers for Epson, Panasonic, Star and JUKI 9-pin dot matrix, as well as HP and Atari lasers.

The 52-page PageAssistant manual includes discussion of color separation and macros. Each topic is

Layout Tips

When doing page layout, it is important to develop a style and follow it consistently throughout. This is to avoid confusing the reader. Almost always, your layout will consist mostly of text columns. Before attempting to start your document, take sometime to create a ruff design. Doing design mocks or comps (ruff draft of layout), will certainly help guide you throughout your layout.

If your design consists of multiple text columns, keep in mind the type size, tracking (character spacing) and leading (line spacing). Try not to cramp or clutter your text columns. Meaning, not to make type sizes too small or too large, adding unnecessary elements, etc. Watch out for triple or more columns, for they tend to make your layout look a bit over crowded. You should adjust the proper leading (line spacing) according to type size. Using the correct leading, will allow the reader eyes to flow line-by-line and not having to revert to the last line read consistently. Multiple column layout on the correct page size, will give a more stable appearance to your document.

An excellent exercise would be to take any magazine, scan it through and decide what you would change to give it a better overall appearance. If no fault is found with the magazine, analyze its appealing qualities and ask yourself, why does it appeal to you?

Continued on next page

covered in detail with an accompanying tutorial. the manual is filled with excellent tips on layout, graphics, halftones and much more.

The software itself has a "Special" menu where you can get information on fonts, PostScript printing, the various mouse pointers PageStream uses, some excellent layout tips and more. On the PageAssistant disk, you also get a couple Type 1 fonts, example PageStream .DOC files and a public domain utility or two.

There is really only one problem I've come across with the software. The manual claims PageAssistant is "resolution independent" and works in TT medium (640 x 480) and high (1280 x 960) resolutions.

I've been able to get the software to run without problems in ST high resolution. The software works in ST medium resolutions, but the textual help does not display properly. In TT medium, PageAssistant displays help menus fine, but dies when attempting to display the helps. In ST high resolution, though, the software performs flawlessly.

Spar Systems is upgrading PageAssistant fairly regularly—they upgraded it three times before I could even get this review finished—and the display problems should be taken care of soon (possibly by the time you read this).

Print Postscript to Paper or Disk

The PostScript language provides the necessary interface for desktop publishing programs to communicate via different outputs. This is important, since most page layout programs save their documents in different formats. You will find this feature useful if you need to print your document file using a higher resolution printer such as the Linotronic L-300. Or, print your work using non Atari desktop publishing systems, like the IBM and Macintosh.

The output achieved using PostScript is quite extraordinary, because information is processed with precision due to the language powerful commands. PostScript printers have their own fonts, memory, processor and can be expensive. This is one of the main reasons why they are not popular in homes and small businesses. Thanks to a company called Imagen, it is now possible to output PostScript files to non-PostScript printers. Their product UltraScript, is a PostScript clone interpreter that relies on the ST, STE or TT internal processor and memory to process the PostScript code, after which it is sent to the connected printer for printing.

PageStream will print the generated PostScript document file directly to a PostScript printer or you have the option to save the PostScript file to disk. If your printer does not support PostScript, you won't be able to print directly, and for that reason your documents will have to be saved. Files saved to diskette or hard drive, can be processed at a later date or printed at any typesetting service bureau that supports PostScript.

Continued on next page

Conclusion

Both CalAssistant and PageAssistant are valuable additions to your DTP setup. These tools can help you unlock the power of Calamus and PageStream. For people who use both, CalAssistant *and* PageAssistant help tremendously in switching back and forth between environments. The included tips can make you more productive and improve your layout skills.

CalAssistant $34.95, PageAssistant $49.95. Spar Systems, 381 Autumn Ave, Brooklyn, NY 11208 (718) 235-3169.

CompuServe puts the whole world at your fingertips.

When you connect your computer to CompuServe, you join the world's largest international network of people with personal computers. You have access to more than a thousand services that offer a source of support, information, entertainment, communications, and benefits of all kinds.

A world of advantages.

CompuServe lets you take advantage of your personal computer in a thousand different ways.

For instance: communication. You'll get invaluable personal computer software and hardware support from other CompuServe members, as well as product manufacturers, all over the world. Meet in special interest forums to discuss everything from science fiction to sharing software. And keep in touch through electronic mail and faxes, as well as by "talking" over 72 CB Simulator channels.

CompuServe also lets you shop coast-to-coast at hundreds of nationally known stores and take advantage of a world-class reference database. It gives you access to the latest national and international news. And our special financial files offer complete statistics on over 10,000 NYSE, AMEX, and OTC securities. You can even trade online with local discount brokers.

Global travel and world-class fun.

CompuServe also offers airline schedules, so you can check out the bargains and book your own flights on almost any airline worldwide. You can get travel news, frequent flier information, and country and travel facts. As well as listings from over 30,000 hotels.

Plus, there are games. Sports, trivia, educational, space fantasy… you can go it alone or compete against players from all over the world. Only on CompuServe can you test your wits in the only online TV-style game show with real prizes, or leave the earth entirely in one of our interactive space adventures.

Just give us a call.

To become a CompuServe member, you need a computer and a modem. We'll send you everything else, including a $25.00 usage credit with your Membership Kit. In most places, you'll be able to go online with a local phone call.

To buy a CompuServe Membership Kit, see your nearest computer dealer. To receive our informative brochure or to order direct, call us today.

And put the whole world at *your* fingertips.

DATA ANALYSIS
WITH YOUR ATARI CLASSIC 8-BIT

Michael Dalto

The Challenge: Use an Atari Classic 8-bit to determine if variations in experimental data occurred by chance alone by using *t*-test analysis for dependent samples. The BASIC program accompanying this article works on all 8-bit Atari computers with 48K, compatible printer and disk drive.

Data can be analyzed from any experiment based on two sets of observations that are paired either because subjects are matched or because the same subject is measured twice. In this type of experimental design, the paired measurements from control and test groups of the same experiment differ only with respect to the parameter being examined. Any variation due to individual differences cancel, making the results more meaningful.

Background

This program determines the validity of the null hypothesis, which states there is no difference between the mean values from two sets of paired measurements. The decision concerning the acceptance or rejection of the null hypothesis is made by comparing a test magnitude calculated from experimental data with a test distribution.

The test distribution employed in this program is a two-tailed *t*-distribution. Since *t*-distributions are used when the sample size is 30 or less, up to 30 paired measurements may be analyzed by this program. The value of the *t*-distribution which is to be compared against a calculated test value is affected by the confidence level which the operator selects. This is the probability of rejecting the null hypothesis when it is true. For scientific purposes, a probability error of less than five percent should be used.

Getting Started

When the program is run, it initially presents the user with a probability selection menu. The probability of error chosen will be used by the program until reset. The user is then presented with a main menu from which several options may be selected.

The "Analysis Of Data" option alternately enables or disables printing of intermediate values used in the calculation of the test value. The "End Program" option terminates the program. The "Probability Reset" option returns the program to the probability selection menu.

The "Recall Data" and "Store Data" options are similar in their operation. When either option is selected, a file directory is displayed and a line from the program will be listed followed by a "Ready" prompt. At this point, the user has been returned to Atari BASIC. The listed program line may now be edited and saved to the filename being recalled or stored. After editing, press the return key and type "Cont" to proceed with the program.

The contents of a recalled file will be printed before returning the user to the main menu. Once a file has been recalled, the program will be reset to whatever probability of error was stored in the file. The probability reset option should then be used to change this value if needed. After storing files, the program returns to the main menu.

The "Return To Continue" option allows the user to input the next data set.

Input of Data

The program allows for entering of a report title. If a previous data set was analyzed, the displayed title may be edited. The number of paired measurements to be analyzed must be entered before the input of data. For each paired measurement, a number is assigned. After entering data, the program allows for correction of any erroneous entries. The paired measurement number is used to refer to the particular measurement(s) to be corrected. If a non-numeric character is input, the routine is aborted and the user is returned to the main menu.

Report Generation

The program generates a report which can be easily pasted into a laboratory notebook. The first section of the report consists of the title and a list of the paired measurements entered into the program. If the data analysis option was selected, the next section of the report consists of all the intermediate values calculated for the generation of the test value.

The last section indicates the null hypothesis tested. This is followed by a comparison of the test value and the table value, with a concluding statement indicating if a difference exists between the pairs of measurements. If the observed variations in data values occurred by chance, no difference exists between measurements.

NOTE: Whenever the } character appears in this listing, it indicates that you should enter the ESC-SHIFT-CLEAR combination—press Escape, then hold down the Shift key while pressing the Clear key.

Inverse text (white text with black backgrounds) should be entered by pressing the Reverse Video Mode Key at the start of the text, then once again after you've typed the text in.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

SHIPPING And HANDLING is always just $3 in North America and $5 Internationally, regardless of quantity of *KE-SOFT* products ordered. NO State Sales Tax is due.

All Advertised ATARI Software Products are Distributed in North America and the Western Hemisphere by:

A-T-A-R-I
(ANSWERS, TIPS AND RELEVANT INFORMATION)
SOFTWARE HACKING

Paul Alhart (AFED)

It all began when I got my first 1200XL back in '83 and started typing in all the magazine programs I could find. There was a little voice in my head that constantly said things like "What does that CHR$ (125) in line 100 do? Change it to CHR$(124) and see what happens."

Later on, as my knowledge of programing progressed, the voice got me to start tampering with commercial programs by asking "Why should you have to load a TRANSLATOR program just to get this program to run?" or "Why not make this program's default settings fit your system?" It wasn't long before I was a hard-core software hacker, modifying software for members of our computer club as well as my own software.

Like most computer clubs, ours has the usual problem of low meeting attendance during the summer months. Also, I noticed other members of our club were interested in software hacking too, even if they didn't all have the knowledge or nerve to tamper with their own favorite programs.

Putting these two facts together inspired me to write The Atari Federation Hackers' Challenge. "The Challenge" is a disk full of tricks and traps and a multi-part secret message. The idea was simple. The club sold the disk as a DOM at a regular meeting and offered fame, fortune and assorted prizes to the first person that was able to call me and quote the entire secret message correctly.

What wasn't so simple was hacking through "The Challenge." It was four months until we had a winner. Members who came to the meetings received hints. Meeting attendance set all time record highs that summer and everyone learned a little bit more about their Ataris and what makes them tick.

The Atari Federation Hackers' Challenge is included on this month's AIM 8-bit DOM as TAF-HC.DCM. Use Bob Puff's DISKCOM3.UTL program from the March/April 1991 AIM DOM to decompress this file to a freshly formatted AtariDOS 2.0 compatible single density disk.

Hack away for your own enjoyment (No prizes are offered this time). I will print the solution to The Challenge here in my monthly A-T-A-R-I column a few months from now.

Your club may make a contest out of "The Challenge" or get ideas for their own Challenge. You'll be surprised how many members will show up when they are challenged. *Note: Cash awards help, too.*

Rules

There are *none.* You may use anything you have to help try and solve "The Challenge."

Requirements

The only things you *need* to solve "The Challenge" are:

- An 8-bit Atari computer
- A disk drive
- Atari BASIC
- Knowledge of your Atari and its Operating System

Tips

"The Challenge" does not write to disk and you should not either. Use a write-protect tab to be safe.

"The Challenge" is auto-booting. Boot the disk with BASIC installed. You will see a title screen after which DOS is loaded. The Atari DOS 2.0 menu will show you something is wrong. A directory listing will show the only thing on the disk is DUP.SYS and there is only 001 free sector.

Happy Hacking!

Qwikforms & Business Forms

Patricia Snyder-Rayl

While there are many packages with clipart or fonts, there are only a couple of packages that give you ready-made PageStream documents that you can use as templates. I'll be looking at Soft-Logik's Business Forms and STerling Connection's Qwikforms. The only other documents package I know of is Idea Forms from Canada's I Koen Design, but I don't currently have that package.

Both Business Forms and Qwikforms are very easy to use. Just load the files in like you would any PageStream document. The package from Soft-Logik comes with one disk and contains 41 different documents. Qwikforms comes on four disks—two of the disks containing a total of 284 documents and the other two disks filled with IMG clipart for your forms.

Both packages have the same sort of standard business forms—Telephone message slips, Invoices, Order Forms, Purchase Orders, Job Quotes, Sales Slips, Petty Cash forms, Interoffice Memos and Statements.

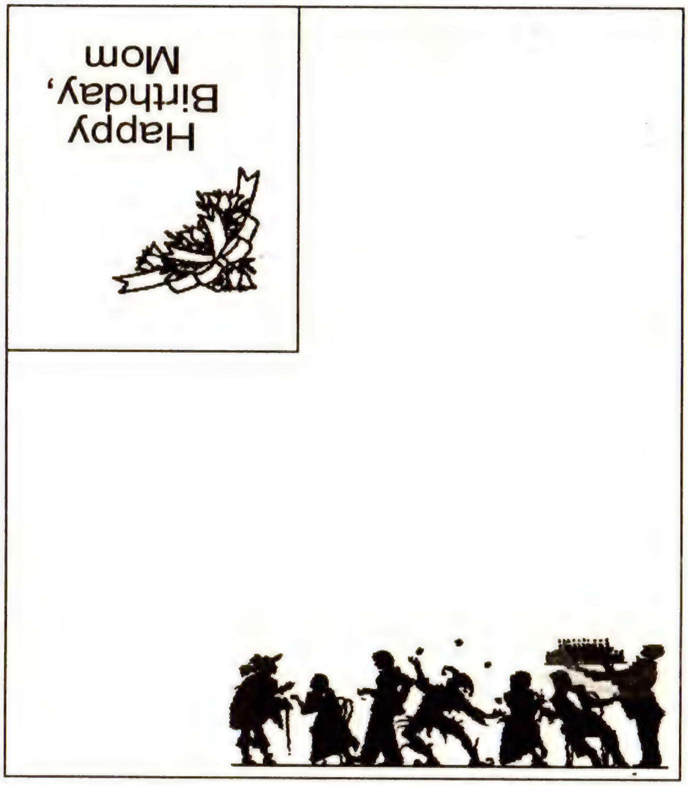
The STerling Connection's Qwikforms package goes a lot further, however. They've included Construction Estimates, Rental Applications, Inventory Forms, Return Authorizations, Accounts Payable and Receivable, and even Employee Vacation Planners.

Qwikforms also contains seven kinds of Calendars, Ledgers (General and Horizontal), Mailing Lists, Payroll Forms, Payroll Withholding Forms, Timesheets, Budget Forms, Cashflow Charts and Daily, Weekly and Yearly Planners.

Qwikforms includes some legal forms as well. These include:

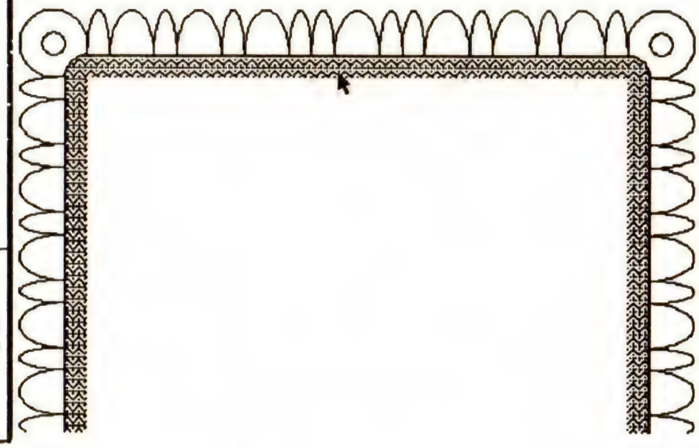
Release of Personal Injury Claims
Bill of Sale for Assets
Agreement to Sell Goods on Consignment
Demand for Payment of Invoice
Notice of Dishonored Check
Sublet Agreement and Landlord's Notice to Terminate Tenancy
Request for Information under Freedom of Information Act
Last Will and Testament



Additionally, there are ready-made forms for designing an 8.5x5.5 inch booklet, the type used for most software manuals. Two- and three-column newsletters are already laid out on grids and a Tabloid (11x17 inch) newsletter is laid out on a five-column grid. Three different types of resumes are included, as are press releases, certificates, flyers, shipping labels, raffle tickets, restaurant menus and four styles of letterhead.

Besides these DTP forms, STerling Connection has included a collection of cards: Birthday cards, invitations, wedding invitations, Valentines, Thank You and Business Appreciation cards. Accompanying these cards are 21 different frames to use as borders for your documents. These range from simple to very complex patterns.

Finally, in a folder labeled MISC, there are several architectural forms with symbols for use in designing kitchens, bathrooms, bedrooms, living rooms and more. Documents with empty grids are all set for designing your own custom brochure, card, newsletter or tabloid. There is also a management diagram chart, a stock report chart and a personal finance statement.



Don't buy another hard disk!

Rounding these all off is a document with music staffs for writing or printing music.

So, for variety and overall utility, the Qwikforms package beats out Soft-Logik's Business Forms very easily.

However, and this is rather subjective, Soft-Logik's forms seem to have been designed with a more professional eye. Their documents just look better than STerling Connection's. And, Soft-Logik's use of shading in certain documents was a nice touch.

The one thing I found annoying about the Qwikforms package was that many of the documents had a little text object with the file name at the top of the page. I personally couldn't understand the purpose behind this, unless it was to help you if you did a trial printout of all the forms. Otherwise, why make you delete an object telling you the name of the PageStream document you just loaded in?

Both packages will save you time and energy in trying to make standard business forms. Overall, Qwikforms from STerling Connection is a great package. It beats Soft-Logik's Business Forms hands down in quantity, but Qwikforms sacrifices some in the quality department to give you tons of forms. If you want completely polished and professional forms with zero effort, Business Forms is a better choice. Personally, I find the variety that Qwikforms gives more than makes up for small amount of effort I expend in prettying up the forms. Both packages retail for $39.95.

STerling Connection, PO Box 4850, Berkeley, CA 94704, (510) 655-2355.

Soft-Logik Publishing, 11131 South Towne Sq. Suite F, Saint Louis, MO 63123, (800) 829-8608.

A Star Returns...

Two special people deserve recognition. The first is my sister, **Sherry**. She has done all the shipping, every night for the last year, despite having a full time job during the day. The second, my friend **Ginger**. She's makes Rising Star shine, she takes most of the orders and keeps it running smoothly. Neither Sherry or Ginger know about their sudden fame, until this ad appears. It's my way of saying thanks and welcome back Ginger.

SST STATUS

JANUARY 16, 1991

Dave Small

[This article was originally posted in the Gadgets by Small RoundTable on GEnie. It appears here courtesy Dave Small (thanks, Dave!).]

Howdy folks! I thought I'd let you know what's been going on with the SST, and why you're not unwrapping them by now. It's been *real* interesting, like the ancient Chinese curse, "May you live in interesting times."

They've been *so* interesting that I've not been online much; I've had some real high priority interruptions here and zero time.

Interesting Software Stuff

We had originally planned to be well into shipping the SST by now, and had the software pretty well whacked. The Beta Testers were happy. Unfortunately, I was still getting *very* odd intermittent crashes, with no rhyme or reason to them. The Beta Testers were solid.

'Twas one of those things where you crash, and there is totally no debugging information available. I wasn't getting "bombs," which would have left some "blood marks" in the $380 crash area. The system would just freeze. There are so many different things that can cause this that I was really stuck as to the problem. Were MMU tables being clobbered and we were double-bus-faulting? Was there a defect in the hard disk support software? And why were my Beta Testers not reporting problems? I replaced hardware like mad (I found a slow PAL in the process, by the way) ...didn't help.

I call these bugs "hair pullers" when I can't use hideously obscene language, because you have *no idea where to even start!* I've written well over 20,000 lines of code for this project—was it there? Were two programs fighting? Was it a conflict with TOS? Already I've worn out my welcome at the Atari software developer's group discussing possible TOS bugs that turned out not to be their problem...no callbacks there!

I pulled out my hair, then ran Minoxodil over my head to make it grow back. (See, that's how the computer biz works. You pull your hair to make money; you make money to grow your hair back). But it *is* getting mighty thin in back, as Pattie Rayl pointed out.

I did many, many sessions that ended with the sky growing light outside. Those are really bad when you have kids that must be driven to school. I played Neil Young on CD, trying to help exorcise the software.

Well, a common factor showed up that was too obvious for anyone to see at the time (because I was convinced the bug was elsewhere). The Beta Testers who ran fine were running Atari's Hard Disk software, AHDI/HDX 4.03 or 5, and I was running ICD software, 5.2 or 5.4.2. The Beta Testers had no, zero, absolutely *no bugs.* They were *astounded* that I wasn't shipping—but I kept crashing!

I started looking intensely (and I do mean with a microscope) at the hard disk software interface. I made absolutely, positively (and 12 other Federal Express advertising words) sure I was feeding ICD the proper parameters for a hard disk call, including all the rwabs() parameters in the read/write flag that most people don't know about, and the buffer=0 media-change hack, too.

You see, this was deep trouble. The manual was on its final editing pass—you know, where you clean up the places where you spell "the" as "teh" and such. And I had already written up the hard disk section believing all was well, because, at the time, I thought I was fighting an MMU bug.

Sandy was *not pleased* when I told her the manual had to be put on "hold" and could not go out for duplication. We'd

> **Sandy and I are both very sorry for the delays in getting the SST out. We sure didn't plan it this way, but it happened. I'm sorry for not keeping more up-to-date online and answering questions, but as you can see, I didn't have answers...**

already been through interesting hassles on test prints of the manual. One time they got the cover SR-71A Blackbird art *reversed*, so the "USAF" was backwards—wow, I thought that would impress people a *lot!* Sandy was busy doing a good, good index on the manual (which is a *lot* of work—if you didn't know, there are professional indexers that make their living doing just that!) and I had just told her that parts of her index might change.

There are times when working with one's marital partner can be stressful. I didn't *quite* have to go sleep at the Ramada Inn after telling her I hadn't nailed the hard disk problem completely. I emphasize "quite" to show you that Sandy is really a very fine person; I told her I felt the software was okay, and I was just having some flaky machine troubles.

So, my hard disk fumble had just held up about all the shipping parts of the operation. We could not proceed on the manual without a "working" hard disk chapter; we could not make master disks, get sample duplications and get a production run. (You *must* check first items; I have been badly burned by duplications that copy, say, 9 of 10 sectors per track "because it was so obviously an IBM format disk.")

In desperation, I called up Doug (Wheeler) at ICD, who used to work here and who is no fool at all. Doug and I chatted about possibilities for bugs to show up and the _FRB buffer (a 64K disk transfer area Atari ruled Shall Exist on a TOS 2 or 3 machine) that hard disks and floppy disks worked. He gave me some very intelligent suggestions on trying to "catch the crash." In all honesty, I wish I had had Doug here during this debug; he has a devious mind that works in a different way than my devious mind, and we find more bugs that way.

GEMULATOR

Run your ST software on a PC!

Today, many ST owners use PCs at work and school. While PC emulators do a minimal job of emulating the PC software on their STs at home, they are slow, difficult to install, and can't emulate EGA or VGA graphics. What a waste of time!

As emulation experts we took on the challenge to use the power of PCs to emulate the ST. Remember, in 1987 we wrote the **ST Xformer** Atari 800 and Apple II emulators. Then we emulated the 130XE, created the cable to connect the 810 and 1050 drives to the ST, and wrote full speed TT and PC versions. ST emulation was the next logical step!

Gemulator is our ST emulator. It completely emulates the 68000 processor, and it uses the PC's keyboard, mouse, disk drives, and monitor to emulate the ST's hardware.

While PC emulators for the ST can cost over $400, we'll be introducing **Gemulator** for under $200. That makes the cost of a complete 386 system with emulator about the same as the cost of a complete ST system - with PC compatibility to boot!

System requirements: any DOS compatible PC with 386 or 486 processor, 4 megabytes of RAM, VGA card and monitor, 3.5" floppy disk drive, and a hard disk. A mouse is optional.

If you missed our Gemulator seminar at the Chicago Atarifest, write or call today for our free newsletter!

Branch Always Software
14150 N.E. 20th Street, Suite 302, Bellevue WA 98007

Compuserve: 73657,2714

I wrote a lot more software, and wrote a baby debugger (OK, I ripped part clean out of Spectre; *I was in a hurry!*) to try to catch bugs. I made self-booting floppies that rammed things into the system "Cookie Jar" at early-boot time. I pulled more hair.

I still couldn't get *any* debugger information on *where* the crashes were! If I could get that, I could look at the code and go "Aha." And the crashes were maddeningly random. I crashed a lot just loading up the debugger!

For a while, I have to tell you, I thought it was the ICD software. I eventually reached a point where I could make it bomb with 2, 3, 4 or 11 bombs fairly reliably by doing things in a certain order. (Wow! What an accomplishment! He broke it!) But this made no d*mn sense to my intuition. As I said, Doug is no fool, and he worked on that stuff with Howard.

Then, in a mad coding session, I added a *lot* more debugging code and suddenly, *BAM! All* the crashes stopped. I had added code to "catch" the 2, 3, 4 and 11 bombs, and was sitting there literally rebooting and rebooting, running Boink and NBM11 and Tempus and DB and *trying to crash,* and it wouldn't crash (to my debugger, where I could see what was wrong).

I was totally hacked off because *now I was ready* to stomp the bug, ready to see what was wrong...and it *would not crash.* I was doing every foolish thing you can do to an SST/ST to try to crash.

I'm still mad it didn't crash. It was a *wimp* way for a bug to go away and a maximum-effort way. And a very, very old thing came to mind. It was from back in CP/M days (I kid you not) when I did an 8080 emulator for a machine called the Dimension 68000. (I really ought to give that code away. Remind me. It's interesting—emulates 8080 on 68000. I learned 68000 while doing it.) Anyway, I had had a bad disk buffer problem there.

I started checking *real* carefully just where every one of the disk buffers was. Random crashouts, like I had just seen, can result when your program gets overlayed, or stepped on, by data coming in off disk. I had had that problem on the 8080 emulator, talking to the 68000 portion of the machine.

Guess what? Oh, yes, there was a problem! After getting a debugger to load (tenth try or so), I found it. One disk buffer was pointed at the heart of the disk handler code.

Adding all that debugger code had moved the rest of the code *just far enough* farther down in memory that the runtime code was no longer clobbered by a disk input to one of the disk buffers. In short, by adding debugger code, I sort of fixed the problem. (The true fix is making enough room for the disk buffer, of course).

I had been fooled by the stuff you need to do to write a program that stays in memory after it ends, a "terminate and stay resident." For some reason (which I could detail, but this is getting long), TOS was not telling everyone to stay the heck out of my program's section of memory. *Depending on how long the next program I loaded was,* it either did or did not kill off my disk handling code. DB was long; it killed things off. QIndex was short. It did not. The key size was 64K.

In addition, the Atari GEM Desktop was using SST RAM (TT RAM equivalent; Fast RAM) as a place to store files in memory while copying. And, you guessed it. If the file to be copied was too long, crash.

What really hacks me off is that I should have triple checked, after asking for *x* amount of memory to be locked away, that it really *did* lock it away...and all the time I spent tracing bugs that didn't exist, like with ICD's software. I had just never seen this lock-away thing fail and didn't suspect it.

And poor ICD. ICD's software was getting an "avalanche error," where things get so screwed up at the start of the avalanche that it was hopeless by the time ICD had any part to play. It was *not their fault.* The carefully traced-out calls were made, of course, with DB in there, shielding the disk handler by its sheer length from the disk.

I went and retested Atari's AHDI/HDX 3.02, 4.02, and 5, ICD 5.2.0 and 5.4.2, and Supra's 3.43 hard disk software (can you tell I was seriously not going to tell Sandy again that the hard disks were flaky?) and *all worked fine.* Oddly, Atari's 4.02 and 5 *do not require* the disk handler code—hey, guess why the Beta Testers were flying? The others do.

In fact, on Atari's software, someone seems to have done a particularly excellent error-checking job in their code. Ken, tell Min she did good, will ya?

Net result is that *now,* I have right here the master "SST Software 1.2" floppy disk and have re-written the manual to reflect all that I learned the really hard way. If you read that portion of it and it seems a little like I was stressed out while writing it, I was.

Interesting TOS

But then, a funny thing happened on the way to shipping...

Because we had been delayed in shipping while I researched the hard disk bug, suddenly TOS 2.06 became available. We looked over 2.06 (we were running 2.05, which required considerable "life support" for things like floppy disks talking to SST RAM and other patches) and 2.06 was really cool. Someone even bent Allan's arm and he kicked on the IFDEF equate that puts TT fastRAM for floppies into the code. (Thank you, someone; I owe you about a thousand chocolate chip cookies.) This was *seriously cool.* It fixed other bugs, too, but I was twitchy on the floppy code. And the funny thing was, because we had been delayed, there was still time to erase EPROMs and go for TOS 2.06 in the SST.

I spent some time Ultraviolet Erasing the EPROMs that hold TOS and tried to make some new TOS chips. When I stuck them into an SST and turned it on, they spat out, "ROM CRC ERROR ON CHIP E," or something like that. Atari or someone had built in a self-test for the ROM chips (*yeah!!*) and it was seeing a problem in the TOS ROMs. Applause for Atari on this one, folks...

So, I burned another set, and it did the same thing.

I "dropped back five and punted" (a phrase any Denver Bronco fan should know!), went to the original chips, and made a *very careful* copy of them through the EPROMMER, making every paranoid assumption I could think of. Gee, maybe the SCSI card in there for the WORM drive is conflicting. Out. Perhaps it's because it's an 8086 processor instead of an 8088 with effective faster throughput. To this raving paranoid approach, I added, yes, Neil Young: Live Rust CD, auto-repeat.

These next EPROMs worked perfectly. Hokay, I said, let's find out what went wrong with those other idiot ROMs. I compare/tested them on the IBM EPROMMER system.

Identical.

I stuck both sets into the SST, read them in, and did a file compare.

Identical.

I have *never seen this* before and don't know why it happened. It could be I just happened to get two bad sets of EPROMs that used to work perfectly and killed them somehow, just a little bit, enough so they still worked, but not all the way. Except the Atari cannot see the problem, the IBM cannot see the problem...except if I plug in the bad ones. I don't know what's wrong. Help! (Doug?)

All I can think of in my bag of tricks is the EPROMMER went funny with the first burn runs, when I wasn't being paranoid, and over-voltaged the EPROMs or something else really weird, so they are slow or aged or crusty. Perhaps there is sorcery involved.

Anyway, after reporting to Sandy that I could not reliably burn EPROMs on our machine, and being nearly exiled to the couch where the cat sleeps (it just smells...great...), I could now tell her I could make them.

Miscellaneous Interesting Times

When you put the new After Dark modules on to the Mac IIfx—where the manual is being edited—and your husband (choke) forgets to tell you about the Installer, they cause a *very hard to find* crash. Yes, the manual tells you to use the Installer. Looks like the System file was getting corrupted—the thing would try to wake up and would say, "Finder has been damaged, you can use System Tools to re-make it." After re-making it a couple times and selectively killing

INITs, we narrowed it to After Dark. We completely deleted and re-installed it, right this time, and got it working.

It's so easy *after* you know the problem, but there are so many things that could be wrong. For a time it looked like a SCSI termination bug, which is no easy thing to fix *at all* on the FX—even worse than the original Mac Plus, where termination is state of the art Vodun (voodoo).

This lost Sandy three days work on the manual when the main Quark X-Press file became corrupted. The manual right now is 2.5 megabytes in length, including all the EPSF diagrams and stuff. Like I tell people, Sandy graduated Computer Science with a far better GPA than I did, and she had done a good job on backups, so it wasn't a disaster—just really annoying. It runs to around 120 8-1/2x11 pages. *We Tell All.*

Then, our 3-year old collides with an 80-pound German Shepherd and breaks his nose, as they both round the corner of the stairs. Dog flees in terror when the child cries. Off to the doctor. X rays. (Imagine how much fun this is by turning your radio to, oh, Motley Crue howling on Volume=10; Jamie is *loud!*).

Turns out his nose wasn't broken; he wasn't grown enough for the bone to be out there. It was just going to be one of those Kid's Tylenol things for a week or so. (The doctor was sure it was broken, too!) Jamie looks like me—we both have "raccoon eyes," me from lack of sleep, him from That Dog.

Cat likes sleeping on the UNIX-PC (AT&T 7300, an older machine) because it is real warm. Cat also likes the FAX machines, but we were getting mad about the number of cat hairs in the outgoing faxes (*lots* of thin vertical lines), so we "encouraged" her not to sleep on the FAX.

Cat apparently took a jump to wake up one morning, and our "out in the open" phone wiring got scrangled—the wiring is only a foot above the 7300 and has some hand-twisted "pairs" where we've had to run new phone wiring for the FAX, etc.

One side of the phone wires snagged with the ground wire I keep around for de-staticing the computers. This spazzed out the phones; they would give around half a ring, then abruptly stop. It took me a few days to find this one. We thought the snow (it has been blizzarding here several times) had, like before, seeped into the underground phone wiring and screwed it up, so we expected the Telco to find it. We expected wrong; the underground portion was fine.

If anyone technically into phones (*chuckle*—not *that* way!) wants to tell me the effect of grounding one "side" of the phone line, I would really like to know. It was eerily quiet in here. I know the 48V-6V DC part; I don't know how it relates (or *if* it does) to ground.

People tell me they got weird half-rings or busy-outs or That Phone Number Sucks messages.

As of Thursday, Jan. 16

The boards have long been done. They are starting to yawn when I walk by. Ever see a SIMM yawn? "Ship me, Dave, Ship me." Honest, they're talking. It is *not* too much Neil Young. Last night it was the DRAM controllers arguing with the SIMMs, real distracting.

The software is now at 1.2 and is going into duplication.

The manual is on final-typo-edit; we laserwrite it, then off to the printers for...well, printing! (And heaven help them if they reverse the SR71 again!) We've tried very hard to make this better than the GCR manual.

Sandy and I are both very sorry for the delays in getting the SST out. We sure didn't plan it this way, but it happened. I'm sorry for not keeping more up-to-date online and answering questions, but as you can see, I didn't have answers...until that hard disk bug was found, there was *no* shipping, for example.

It's just a hard thing to say, "Well, I still don't know what the heck is wrong" when you're the Shell Answer Man, so to speak.

I hope this detailed report on where we went off the rails and got back on them will help you out.

Non-SST Stuff

As you might imagine, when I focus this tightly on a problem, I try not to switch gears. System 7 hasn't seen a lot of work other than tracking a get-extended-parameter-RAM into location 0 and above (!!) call (which is a *big* mistake for the 680x0 processor!). I need to look into it.

The MegaTalk boards have had their defective PALs swapped out and are being tested, about 75% of the way through on that. (The serial I/O PAL was bad; we have been seeing some really bad failure rates on these chips.)

I didn't do many of the dishes; need to make that up to Sandy.

Jennifer didn't do her Mt. Fuji picture (I kid you not) until the night before, up late, and *wow* was she grouchy this morning at 6:30 AM. She's doing a report on Japan and needed to draw a landmark.

And, I grew a beard. Sandy says it isn't scratchy, quote, "anymore."

When the SST boards actually, definitely are in the mail, we'll post a note. Murphy Never Sleeps, but neither does Neil.

[Ed: On January 29, George Richardson informed us that the SST boards were only a couple days away from going out the door. Getting the manual back from the printer was the only holdup, and it was "on the way."]

Has your local Atari dealer headed for greener pastures? Are ads for Mac Classics and 386's appealing to you?

We have a solution.

Atari Advantage Magazine

The editors of Atari Advantage Magazine would like to introduce you to a new way of thinking about your Atari ST/TT computer system. You don't have to feel like you own a second rate machine just because the company who built it hasn't done much to promote it. You don't have to muffle your voice with your hand when you respond to someone's question about which computer you own. You especially don't have to give in to the temptation of a PC clone or Mac.

We believe that if we can show you how to take full advantage of the things that your Atari can do right now, those doubts you might have about your decision to buy one will disappear like roaches in a Raid commercial. You don't have to be "into" music to enjoy the "Atari Advantage". You don't have to be "into" games, Desktop publishing, Desktop video, programming, education, art, business, or any of the other varied and assorted things people find to do with their Ataris. But we'd imagine you are.

In every one of our issues we intend to pack as much information as we can to help you take full advanatage of your Atari. From software and hardware reviews to helpful tutorials, to feature articles about the exciting things going on right now in the Atari market, you will find no better source for up to the minute useful information than Atari Advantage Magazine.

Experience the Atari Advantage!

AIM Mac/Spectre Disk of the Month

Each AIM Mac/Spectre Disk of the Month is a double-sided disk packed with some of the best PD and Shareware programs available each month. The disks are available in either Macintosh or Spectre formats. All files are self-extracting Compactor Pro archives. Just double click to extract!

Here is a short description of the files contained on the March '92 Mac/Spectre Disk of the Month:

CreateTextDA—This archive contains an application that will create a Desk Accessory that displays any text you wish. Handy for keeping needed information close by.

Cute Clock DAs—This archive contains three interesting desktop clock DAs...Bugs Bunny clock, Mickey Mouse clock and RKO Radio Pictures clock.

Jack—This archive contains a very good version of an ancient game, the most recent version of which is called Pente. The object of the game is to get five of your pieces in a row while blocking your opponent (the computer) from doing the same. All the while, Jack, whose face appears at the bottom of the screen, keeps an eye (or two) on you, grins when he's winning and frowns when you block him.

LightningPaint 1.1—This archive contains a *very* nice Shareware paint program that has most of the features of the commercial programs and a few even they don't have.

Little Black Book DA—Just like the name suggests. This is an address book in a DA. Very nicely done and quite easy to use.

Notify 2.1—This archive contains a control panel device (CDEV) that uses the Macintosh notification manager to place messages you've created on the screen at whatever time you select. Great for reminding yourself to take out the garbage...or whatever.

Panasonic Printer Drivers—This archive contains two printer drivers for use with Panasonic printers. One supports 9-pin printers and the other is for 24-pin printers. I have only tested the 9-pin driver and it works *very* well for either text or graphics. To use either of these drivers, place them in your system folder and then use the Chooser DA to select. There is a setup dialog that allows you to configure the driver for your system. (Note: These drivers should also work with Epson printers)

RamDisk+2.11—This is the king of the hill as far as Mac RAMdisk programs go. You name it, it does it.... if you run from a floppy (and have the memory) you *need* this program.

Reader 1.0.8—This archive contains an aplication to read documents created by other applications. This program is somewhat limited at this time but is still useful. Drivers are included to read text files, MacPaint pictures, PICT graphics and others.

SUSAN—This archive contains a Shareware game called Susan, based on a board game of the same name. It's a pretty good strategy game, also reminiscent of Pente. In Susan, though, the object of the game is to surround one of your opponent's pieces without getting yourself boxed in.

The Billiard Parlour—A game that's quite old but still a lot of fun. Lots of different combinations from 9 ball to straight pool. If you like Billiards or pool, you'll like this game.

Note: Some of these programs are Shareware. This means that if you continue to use a program after trying it out, you are expected to pay the small fee most authors ask. Please support them.

Readers can purchase this disk by sending $6 ($5+$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the March '92 Mac/Spectre Disk and which format when ordering. For credit card orders, phone (313) 973-8825.

AIM ST/Mega Disk of the Month

All files on this disk are self-extracting archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the March '92 disk. For more complete docs, see the text files contained in most of these archives.

ARCSHL31.APP—The latest version of Charles F. Johnson's ARCShell, a GEM shell for ARC and LHARC compression utilities. New features include full support of the newest LHARC programs from Thomas Quester. Note: ARC and LHARC utilities are not included in this file. Shareware. Copyright 1989-92 Charles F. Johnson & Little Green Footballs. All Rights Reserved.

BONBON.APP—Two ACC/PRG (rename as needed) games from Germany, Breakout and Kubis (a Tetris clone). They work in ST mono or medium rez color. Note: Breakout does not seem to run as a PRG on MegaSTE or TT, but it works fine as an ACC.

B_BUNDLE.APP—Decorative border maker accessory for Calamus. Creates Calamus CVG graphics from border corners and sides. Comes with five borders and documentation telly you how to get up to 100 more! Can run as an accessory or as a program.

CRAYOLA.APP—PageStream color palette containing color definitions to match the 64 crayon set of Crayola Crayons.

DISKDIAG.APP—Examines your hard disks and warns you if it finds problems. Run it when you have problems accessing files or folders on a disk. You should also run it occasionally to detect problems before they become serious. Automatically checks all the hard disks on your system. If it finds problems, it will report information about the problems and stop. May be placed in your AUTO folder to check your disks each time you boot! FREEWARE. Courtesy of Beckemeyer Development.

FILETOOL.APP—A mouse-driven file utility that lets you copy, rename, delete and move files, create folders, etc. Shareware from the UK.

FLEABYT3.APP—Three new versions of Fleabyte calculation accessories from Henry K. van Eyken of Quebec. Fleabyte\FFS is a full function scientific calculator; Fleabyte\SF is like FFS only with support for significant digits; and Fleabyte\SX is a "standard" calculator. All three have the built-in ability to export their calculations directly into window-based GEM programs (like word processors). Full documentation and GFA BASIC source listings included.

FUJIWTCH.APP—The latest enhancements to Chet Walter's popular FujiDesk. FujiWatch gives you a mouse pointer that looks where it's going and falls to dreamland after a period of inactivity! A ticking watch replaces the boring busy bee! A spinning or rainbow Fuji adorns your menu bar. All this, and a "fix" for nasty alert boxes that appear with NO MOUSE POINTER! Configurable with enclosed ACC/PRG. ShareWare from Chet Walters @ WizWorks.

GEMVLP26.APP—A working demo of GEMvelope version 2.6, the best and most feature packed envelope printing software available for the ST/TT. Lots of features.

HDINFO12.APP—Ever tried to save a file only to find out your hard drive partition is full? HDInfo can help you avoid this situation, by renaming your hard drive icons to reflect the amount of free space available on them. From GraF/X & Dixon Development.

HSFIX.APP—A high speed modem fix for owners of TOS 1.4 or higher AND a 16MHz or faster upgrade. Stops character loss and speeds up overall performance. On the MegaSTE and TT, use this and Serial Patch 2 (SERIAL.APP on the June '91 AIM ST Disk) to correct serial port problems.

INSDATE.APP—A tiny desk accessory that sends the current system date to any open application. Great for word processing or while online. Includes source code. Freeware from the UK.

LQSET.APP—A very nice utility for controlling the multitude of printer settings available on an Epson LQ printer. Control margins, text attributes, page length, etc. PRG and ACC versions enclosed. Personal Pascal source code included. This Epson LQ version was written by Forrest Blood (JACS).

MSTE.APP—A collection of four small programs to set various Cache and Speed settings for the MegaSTE computer. All of the programs will run from the Desktop, AUTO folder and in TOS Mode. The programs are: FAST (16MHz, Cache), NORM (8MHz, No Cache), FASTNC (16MHz, No Cache) and WHATAMI (tells you your current configuration). Shareware from John Townsend.

NBM21.APP—NBM v1.2 is a benchmarking program for your ST/STe/TT. It performs a group of six tests, times them and allows you to compare the results with other machines. You can optionally choose which of the six tests to run, and can print the results. Version 1.2 includes a new set of graphics tests. Program by Jim Ness, author of QuickCIS.

PANTONE.APP—An EPS graphic containing the full Pantone color palette. Loading this graphic into PageStream 2.1 gives you access to all of these colors. The Pantone Color Matching system is trademarked by Pantone, Inc.

PGSPRNTR.APP—A set of four beta printer drivers for PageStream 2.1. These drivers support the HP DeskJet 500C, HP PaintJet XL, SpectraStar CMY and Okimate color printers.

PGS_CS.APP—This desk accessory (for PageStream 2.1) is an upgrade to PGS_AP_D which allows access to those "odd-ball" characters which normally would require complex key combinations and a chart. Includes the low-end characters (card suits, etc.). The enclosed documentation is in PageStream 2.1 format.

PINHD21.APP—PinHead version 2.1 is now compatible with ALL versions of TOS in ROM, from TOS 1.0 up to TOS 2.6/3.06. PinHead is a tiny AUTO folder utility that speeds up the loading of all programs. You won't believe how much faster your bootup goes! It's similar to TOS's "fastload bit," but completely automatic and more compatible with problem programs and accessories. PinHead 2.1 is Shareware. Copyright 1989,90,91,92 Charles F. Johnson & Little Green Footballs. All Rights Reserved.

PROCALC.APP—A calculator similar to the one included in Atari's new STBook. Supports Scientific, Binary, Octal, Decimal, Hexidecimal and Time (H:M:S) calculations. Very nice interface. TT Compatible. Runs as a PRG or ACC. Shareware from John Brochu (author of PicSwitch).

SPELLONE.APP—A very good, GEM-based spell-checker for the Atari ST. Includes a 137K dictionary of common words, and lets you add your own words to the dictionary. Another great piece of software from the UK.

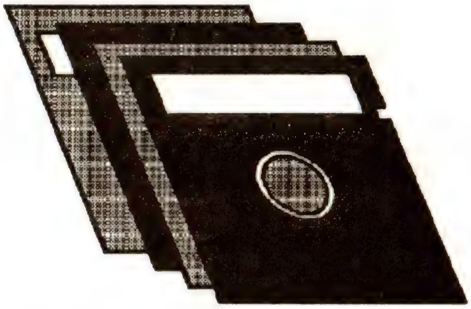
TURTLE.APP—The latest version of George Woodside's excellent hard drive backup program.

UPDMAKER.APP— Update Maker compares two versions of a program and creates a binary data file of the changes. Can create a data file including just the change info if you wish to write your own updater program, or it can create a "ZAP" file including verification information, ready for use by Superzap. Superzap (included in this ARC) can use the resulting ZAP file to perform the update for you—no programming necessary! Both programs run on any ST or TT in any resolution. Freeware from Bill Aycock.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the March '92 ST/Mega disk when ordering.

AIM

Atari Classic (8-bit) Disk March 1992



Each AIM 8-bit Disk of the Month is a single-sided, single density "flippy" packed with software. To extract files in the ARC format, you need the UNARC.COM utility. To decompress files with a DCM extension, you need DISKCOM3.UTL. Both programs are available from most BBSes, user groups or you can purchase the April/May '91 AIM 8-bit Disk.

Here's a short description of the files on the March '92 8-bit Disk:

Side 1

BABYLON.ARC—Details on a hardware modification, called the Babylon Upgrade, that can be used to give your XL (800XL, 1200XL) a truly "persistent" RAM-based OS. Not only is this operating system able to survive anything short of turning the computer off, but it's also unchangeable once activated!

JR2.ARC—JR's BASIC Games Collection #2! Original programs, written by Jeff Payne, Jr., including Test Your Memory, Splat a Brat, Spaceship Excitement, Computer Hang Guy, Knight Rider, Fortune Teller, Guess a Number, Horse Racing and JR Math.

MAGICALC.ARC—A great new program from Paul Alhart of Atari Federation. MagiCalc XL is a four-function calculator that displays results in Decimal, Hexidecimal and Binary all at once. Best of all, MagiCalc sits in the unused 12K available on an 256K XL if booted with two single density RAM-disks. Pressing a "hot key" calls up MagiCalc and, upon exiting from the calculator, whatever process was going on when you pressed the hot key will automatically resume. This is *very* similar to the way desk accessories work on the Atari ST computers.

TAFHC.DCM—The Atari Federation Hacker's Challenge, also written by Paul Alhart, is a puzzle for all you 8-bit hackers out there. The Challenge is a disk full of tricks and traps. The object is to put together a multi-part secret message. Read Paul Alhart's A-T-A-R-I column in this issue of Atari Interface for more details. Good luck!

TTEST.ARC—A BASIC program, written by Michael Dalto, that determines if variations in experimental data occur by chance alone by using t-test analysis for dependent samples. TTEST is designed for scientific use. This program accompanies the Data Analysis with Your Atari Classic 8-bit article in this month's issue (the article is also included in this ARC).

Side 2

BIRTHDAY.ARC—A BASIC LISTing of a very nice and easy to use program for keeping track of people's birthdays. Written by Calvin Franklin of the O-ACES user group.

DIAMENU.ARC—Load BASIC programs using the DIAMOND 3.0 built in file Selector routine. This program is writen in BASIC so you must exit from the Diamond desktop and run this like any other BASIC program. A good example of how to program Diamond functions from BASIC. Written by Kevin Packard (WNYAUG). Requires Diamond GOS from Reevesoft.

ETERNAL.ARC—A BASIC game somewhat similar to a popular old 2600 game called Adventure.

MATH.DCM—Mathematical analysis programs, including intervals, roots, fixed point math, derivatives, integrals, polynomials, interpolation and more. This DISKCOM file extracts to create a SD boot disk. Simply decompress this file to a disk and reboot your system with BASIC enabled.

QUEST.ARC—An outboard command module that adds user surveys or questionnaires to AtariLink BBS 2.0 or greater. Docs included. (The complete AtariLink BBS 2.0 was contained on the Nov. '91 AIM 8-bit Disk.)

SORT.ARC—A BASIC XE program that sorts text/data files. Supports 1-250 lines of 1-38 characters each. Options include sorting in ascending or descending order and sorting with numbers having priority over letters or vice versa. Sorted lists can be printed to screen or printer, saved to a new file or appended to an existing file. Lots of other features. Note: You must have BASIC XE to run this program.

Readers can purchase this disk from the local AIM participating user group or by sending $6 ($5 +$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Please specify the March '92 8-bit Disk when ordering.

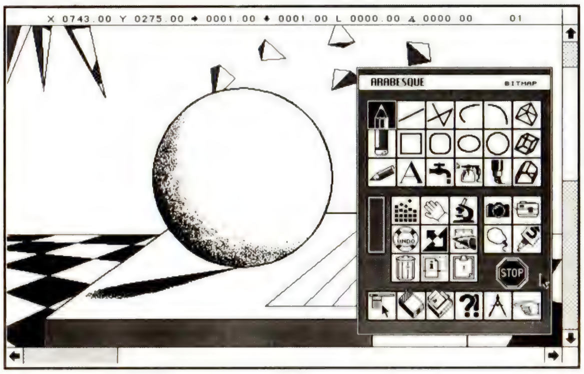
Arabesque™
PROFESSIONAL

Illustration made easy!

Arabesque Professional is a complete Bitmap and Vector based illustration program. It allows you to create, import, edit, and save graphics in the two standard computer formats, Bitmap and Vector.



X 0743.00 Y 0275.00 ✦ 0001.00 ✦ 0001.00 L 0000.00 ∡ 0000.00 01

ARABESQUE
VECTOR
UNDO
STOP

Features include:

- Easy to use, icon-driven, pop-up menus.
- Edit up to 20 drawing pages in memory.
- Draw points, lines, Bézier polygons, B-splines, circles, ellipses, arcs, 2D/3D, and rectangles (with or without rounded corners) in Bitmap or Vector mode.
- Choose from various line end styles, thicknesses, drawing modes, etc.
- 108 different fill patterns, edit your own or use an image block.
- Block operations (rectangle or arbitrary shape) including: cut, paste, mirror, rotate, bend, increase contrast, contour, smooth, enlarge, save and load.
- Outputs to 9- and 24-pin dot matrix, "Bubblejet", as well as Atari and HP laser printers.
- All functions operate rapidly in magnification mode.
- A complete UNDO feature.
- Load and save various graphic types including IMG, IFF, Degas, NeoChrome, Doodle, Calamus CVG, GEM/3 and Arabeque's own compressed formats.
- Configurable "spray can" feature.
- Complete selection of drawing modes, including: replace, XOR, AND, transparent, reverse, and more.
- Easily convert Vector graphics to Bitmap graphics, with optional use of gray scales.
- Fully illustrated manual.

Arabesque is also a program with an incredible amount of attention to detail. Its speed will amaze you, while its ease of use will astound you!

Arabesque is compatible with all Atari computers. It supports large display screens, like the Moniterm. Requires at least 1 megabyte of RAM and a monochrome monitor.

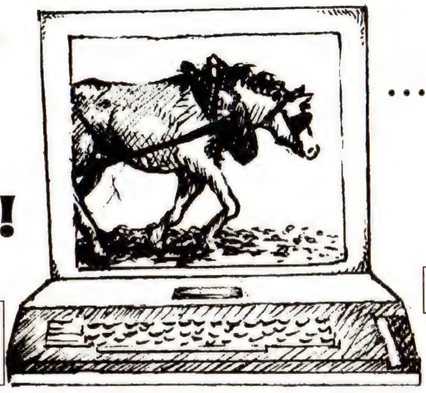
Make your 8-bit a Workhorse!



...with power products from Computer Software Services

Power Products for your XF551

$99.95 THE XF SINGLE DRIVE UPGRADE $99.95

Double the storage capacity of your XF551 with our 3.5" 720k **single drive upgrade!** Included with the upgrade is a Sony 3.5" disk drive in a 5.25" faceplate that perfectly replaces the existing 5.25" drive. The 3.5" drives are newer technology, more reliable, and easier to handle. Do NOT confuse this with public domain upgrades! The completely re-written drive OS adds these features:

- **Fixes incompatibilities** with commercial software
- **Eliminates** density **reconfiguring problems**
- Switches to second side without reconfiguring
- **Ultra Speed** I/O compatible
- Very **high speed** sector skew in US mode
- Capable of reading **IBM** and/or **ST** disks
- Compatible with 40 OR 80 track drives

Included with the upgrade is a utility program capable of reading IBM and/or ST disks, so you can import text or binary files to your 8-bit (text conversion routines are included). Minimal soldering is required; but we provide free installation for any of our products! Only $99.95 plus $8 S/H/I. If you already have a 3.5" drive, you may obtain the single drive upgrade without the Sony drive for $59.95 plus $5 S/H/I.

$139.95 THE XF DUAL DRIVE UPGRADE $139.95

Our XF Dual drive upgrade allows you to **add** a 3.5" drive to your XF551, while keeping the 5.25" mechanism. This is a totally **switchless** upgrade that turns your XF into two disk drives! The added 3.5" drive assumes the next drive number higher than the 5.25" and is totally independent, so you can copy between drives, even mixing densities! This product has all of the features of the above single drive upgrade, available for **both** drives! Complete with Sony 3.5" drive, only $139.95 plus $8 S/H/I. The upgrade without the drive is $79.95 plus $5 S/H/I. A special version to handle dual 3.5" mechanisms is available for an additional $20.

THE FLOPPY BOARD $109/149

The Floppy Board has arrived! This long-awaited Black Box add-on has been in the making for quite a while, but we've packed it with features that are worth the wait! This sophisticated device allows connection of up to four 5.25" or 3.5" floppy drives (drive sizes may be mixed). Access to these drives will be at parallel bus speed, approaching that of hard disks!

The board consists of 13 special integrated circuit chips, fully powered by the power supply of the Black Box. It has its own on-board microprocessor to take the load off the computer's processor for disk I/O. The board and fits perfectly over the Black Box (inside the custom cases!). It is not a stand-alone device; it must be used in conjunction with the Black Box.

High density disks are supported, so 1.2 meg 5.25" and 1.44 meg 3.5" drives may be connected. This is the only 8-bit controller to fully support these drives and densities! With four 3.5" 1.44 meg drives connected, you can achieve more total storage than a 5 meg hard disk! Archiver compatibility is supported! This means you can back up those titles no longer available. Although it's not as powerful as our Super Archiver, it will have the same editing power, with good backup capability.

Software included with the Floppy Board includes a utility to READ and WRITE IBM and ST disk formats! This will yield the easiest possible way to port text and data files between your 8-bit and ST or PC! This will be compatible with most all of the current formats. Also included is a high-speed sector copier designed to make extremely fast, verified copies of disks. A future upgrade to the Hard Drive Pro Backup (our hard disk backup tool) will make special use of the floppy board, and squeeze even more data on each disk than standard formats allow. It is possible to actually store 1.6 megs of data on a 1.44 meg 3.5" drive, so backing up a full 20 meg hard disks might only take 14 disks! Usage of the Floppy Board's on-board processor will allow overlapping reading and writing, making the backup really fly.

Two versions are available: the basic unit, and the Deluxe version. The basic unit provides the interface necessary for low density drives (360k for 5.25" and 720K for 3.5"), and comes with the IBM/ST transfer utility. The Deluxe version adds the high density capability, adds Archiver compatibility, AND adds the features of the Black Box Enhancer, which include a high-resolution 16 grey scale printer screen dump, and a powerful built-in sector editor, disassembler, and copier (which accesses the full 16 megs possible of hard disk partitions, and uses all available extra memory). Note: the Floppy Board replaces the ROM on the Black Box, so current Black Box Enhancers cannot be used with the Floppy Board.

The basic unit is only $109.95, and the deluxe unit is only $149.95. Add $5 for shipping/handling.

Power products for your XL/XE computer

~~$69.95~~ THE ULTRA SPEED PLUS OS ~~$69.95~~

>> *Fall special* *price* - *$59.95!* <<

The Operating System that should be in every XL/XE computer! The **ULTRA SPEED PLUS** puts unbelievable speed and convenience at your fingertips. After using it a while, you'll wonder how you ever got along without it! Use **ANY DOS** to place **ULTRA HIGH SPEED** formats on your disks (with XF551 or modified 1050 drives), reconfigure and boot any drive (1-9 or even your **RAMDISK!**), sector copy single and double density disks to your RAMDISK, activate a built-in **400/800 OS** for compatibility, and much more! Below are a list of features. Only $59.95 + $5 S/H/I.

- **ULTRA SPEED SIO** for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from RAMDISK
- Special timer circuits not required for 1 and 2 megs
- Background colors adjustable
- Reverse use of **OPTION** key
- Toggle internal **BASIC**
- Built-in drive number editor (including RAMDISK drive)
- Toggle screen off for up to 40% increase in speed
- **DOUBLE DENSITY RAMDISK** handlers
- **ENTIRE MEMORY TEST** that pinpoints defective RAM chips
- Boot any drive (1-9) on cold start
- Supports ALL XE-compatible memory upgrades up to **two megabytes**
- **THREE** Operating Systems in one **(XL/XE, 400/800, ULTRA SPEED PLUS)**
- **COLD-START** without memory loss
- Built-in mini sector copier
- **RAMDISK** exactly duplicates floppy drive so sector copying and editing are possible

$199.95 THE BLACK BOX $199.95

The **BLACK BOX** is a parallel-port device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It is a T-shaped board with two buttons, two switches, and a set of dip switches visible from the outside. The **BLACK BOX** performs three main tasks: interface to a SASI/SCSI bus (for interface to most common hard disks), a parallel printer port, and a RS232 (modem) port. You may partition your hard disk(s) into as many drives as you wish; up to 9 may be active at any given time. By pressing one of the buttons on the **BLACK BOX**, you will enter the configuration menu, where you can re-assign drive numbers, swap partitions in and out, etc. When you exit, you will be returned to your program – undisturbed! Each hard disk partition has its own write-protect flag, and may be set to single or double density. Every hard disk may be write-protected with the flip of a switch. As an option, you may use your computer's XE RAM as a printer buffer, or order the BLACK BOX with 64K of on-board RAM.Another amazing feature of the BLACK BOX is the built-in **screen dump**. By simply pressing a button, the contents of your screen will be dumped to your printer! (You can define text or graphics modes with a switch!) The RS232 port supplies the full spec signals for added compatibility. Its handler takes up no user memory, and can handle 19,200 BAUD! A **machine language monitor** has been added to allow memory disassembly, memory/register changes, and more. The basic **BLACK BOX** unit is $199.95, and $249.95 with 64K RAM (for printer spooler). S/H/I is $8. An optional custom BLACK BOX case is available for $39.95. The Black Box is a product of Computer Software Services... Not the Black Box Corporation.

HARD DISK SYSTEMS

We offer complete, ready-to-run hard disk systems from 5 megs on up! These systems include a hard disk, Black Box, power supply, controller, cables, and software. Everything is preformatted and tested, so all you have to do is plug it in and boot! Prices start as low as $399. Call for the latest prices and specials!

INSTALLATION AND REPAIRS

Althoough installation of any of our products is easy, by taking advantage of our free installation offer, you can rest assured it will be done right. All you pay is the freight charges
For repair of Atari 8-bit computers and drives at reasonable rates, contact our repair department at (716) 429-5639. All work is guaranteed, and there are no minimum estimate fees

TWO FOR ONE DEAL!

If you have two or more of the same items needing repair and don't want to spend any money send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE - we'll keep the other defective one for parts! Please call before sending anything in.

We carry many other items - call for our FREE catalog!

Dealer/Distributor/User Group discounts available–call for info.

We accept VISA and Master Card. NY Residents please add sales tax.

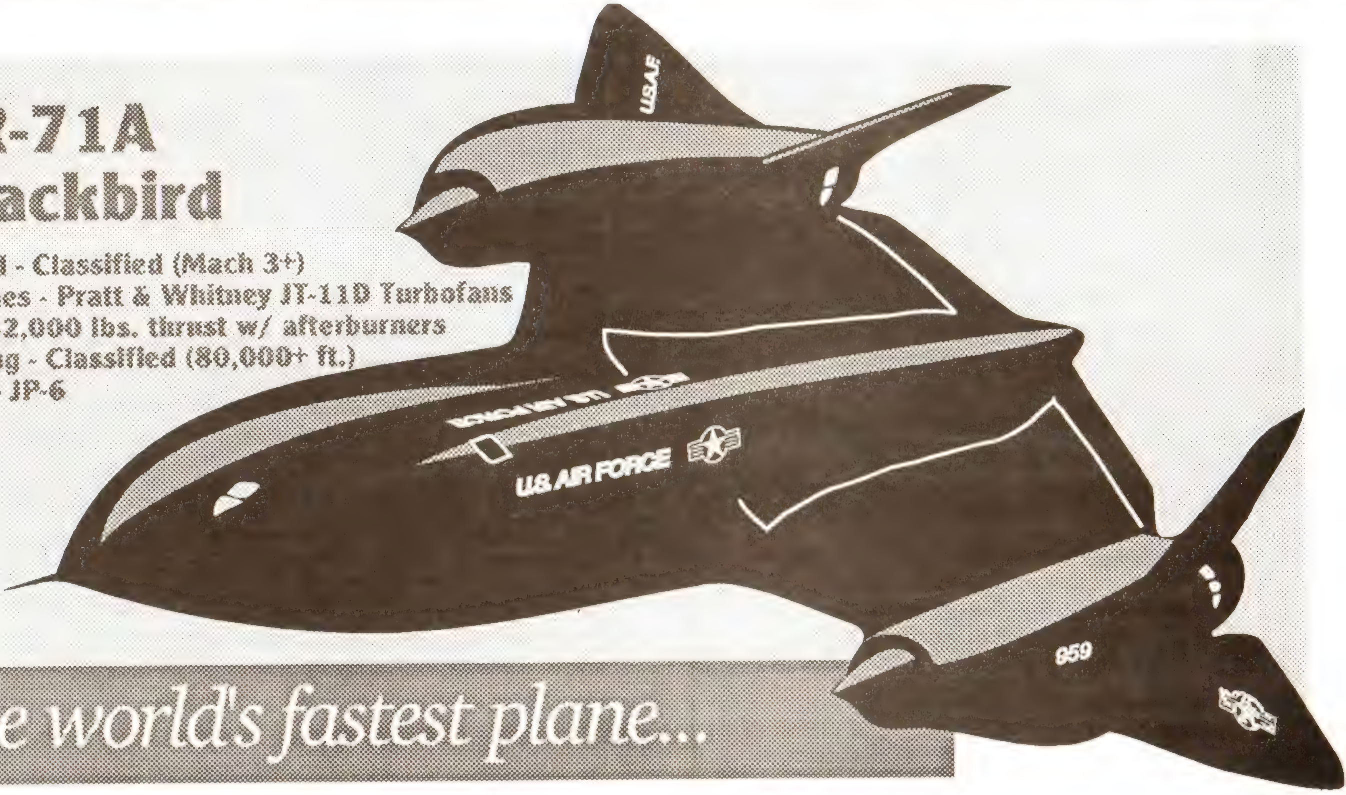
feel the need... THE NEED FOR SPEED

SR-71A Blackbird

Speed - Classified (Mach 3+)
Engines - Pratt & Whitney JT-11D Turbofans
32,000 lbs. thrust w/ afterburners
Ceiling - Classified (80,000+ ft.)
Fuel - JP-6



the world's fastest plane...

SST

...the world's fastest Atari

Introducing the fastest, most compatible, most flexible accelerator available for the Atari Mega ST: the splendiferous totally cool ***68030 SST****. With its screamingly fast 68030 microprocessor, up to 8 meg of fastRAM (to 12 meg total), asynchronous design, and special compatibility software by Dave Small, the SST is any "ST pilot's" dream...*

...The dream can be ***yours****! So bring your Mega ST into the 90's, and turn it into one of the fastest machines on the planet!*

From the people who brought you Macintosh emulation on the Atari (and whose Dad actually flew the SR-71).

SST prices start at $599.00

68030 SST

Speed - 18 to 40 MHz asynchronous design; up to 12 times faster than a Mega ST
Engine - MC68030 Microprocessor with Caches and Burst Mode Afterburner
Ceiling - up to 12 Megabytes of RAM
Fuel - up to 8 Megabytes of 32 bit fastRAM in tandem with a 20 or 33 MHz oscillator
Operating System - TOS 2.06 (Mega ST^{4}), with the new Atari desktop
Expansion - processor direct slot; Chromax Super Video board already "in rollout"
User Upgradeable - when ever you want to

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs are preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari TT/030, HP Laserjet II with PacificPage PostScript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.

Editorial Ramblings

Apparently, the firm we use to duplicate our ST disks made an error when setting up our job on the March ST disk. If your March ST disk has problems, just send it back to us and we'll replace it for you. We'd like to thank our subscribers and clubs for their patience and understanding during this fiasco.

In this issue is an ad from Fast Technology for their Tiny Turbo030. For the purpose of clarification (and fairness), we'd like to point out that figures used by Fast Technology in that ad compare their product (running at 40MHz) to an 030 board (presumably, the Gadgets SST Board) running at 33MHz. (The SST board can run using a 40MHz 68030, with considerably better benchmark numbers than a 33MHz SST.) Also, the latest figures we have from Gadgets puts the DynaCadd Cup Test at 44, rather than the 48 listed in the Fast Technology ad.

This issue sets a new record. There are over 100 clubs now participating in Atari Interface—104 to be exact! Along with the addition of new clubs, we've added two more distributors (one in Canada and one in Australia) and our "regular" magazine distributor has placed us in an additional 250 Waldenbookstores! So, things keep looking up for AIM! Watch for even more clubs signing up in the coming months.

We will be exhibiting at the April Toronto (Ontario, Canada) show at the Skyline Hotel at the Toronto Airport on April 4-5. If you're planning to attend this show, please stop in at our booth and say hello.

Bill & Pattie Rayl

What Really Happened to Practical Solutions?

Many people have talked about Practical Solutions closing up shop. The usual "low sales, high overhead" was cited as the cause of their demise.

Here's what really happened. Two years ago, we licensed our Cable-B-Gone technology to Practical Solutions (AIM—April. 1990) so they could build their cordless mouse.

They were so impressed with our line of over-the-edge, uh... cutting edge products, they wanted the rights to market our Nuclear Powered Anti-Pirate Device (NPAPD) to supplement their copy protection dongle. Practical Solutions was manufacturing the units in house and storing them in an adjacent warehouse.

One day, a computer virus that had been unknowingly burned into the control ROMs tripped all the NPAPDs simultaneously. Oops!

Sledge at COMDEX

I continuously hear "Why don't I see the Sledge Hammer Hardware & Software product line at COMDEX?"

The answer is simple. Every year when we try to get a booth at COMDEX, the local police, fire, health and DPW departments ban us from the show claiming our equipment is too dangerous for the general public.

The DPW states they have neither the equipment nor the manpower to clean up the so called "massive amount of rubble" left in the wake of our product demos. The DPW has a valid point, but how else can we sell hardware at the show without spectacular demos? People keep whispering to me, "Demo means demonstration not demolition." I don't agree.

Go check out the "Demo" at your local new or used car lot, then decide.

Attempted Burglary at SH H&S

The 1991 year was an exciting one here at Sledge Hammer H&S. Less than a month after last year's update we had an attempted burglary at our research and development complex.

The scum-suckers apparently tried to make off with some high tech equipment. Fortunately, we had integrated our Nuclear Powered Anti-Pirate Devices into our security system.

I hear the mushroom cloud was awesome. We spent most of 1991 waiting for the radiation levels to drop low enough to stop melting the cleanup personnel.

The explosion caused almost a total loss. However, we did recover all of our Magnum monitors, completely intact and in working order. These babies can really take a beating—they were scattered across seven states and part of Canada.

We also recovered the platter from our Super Hammer Hard Drive.

After the clean up, it was time to file an insurance claim. We found our insurance company doesn't cover any losses if a flux capacitor is on the premises at the time of the loss (go figure out that one). After the insurance company talked it over with my .44 Magnum, they coughed up some money. I took the settlement and $10 out my own pocket and bought a Lynx.

The Future of SH H&S

I haven't decided whether or not to resurrect Sledge Hammer H&S. It was easy competing against Atari's vaporware, but now some of their products are actually materializing. Have you any idea how difficult it is to compete against tangible products? We are looking into other product lines.

Since police brutality seems to be the in thing this year (Ah, good, my methods of law enforcement are catching on). We've come up with a modification for the new laser speed guns now available to the police.

The gun, in its original condition, is used to clock vehicle speed exactly the way current radar guns work. Instead of the gun shooting a high frequency radio wave pulse, the new laser guns use a light pulse emitted from a low power laser.

It's pretty boring to me, so we spiced it up. We've added two new settings on the laser gun: "Stun" and "Max." This gun can now help the officer make arrests. "Stun" is used on the ornery motorist who doesn't pull over, while "Max" is reserved for those choice moments when the officer really gets cheesed off.

Sledg-a-torial

Usually I don't get up on a soap box and preach. I let my .44 Magnum do it for me. Shooting and killing people hasn't gotten them to buy American, neither have other forms of mindless violence and brutality, so it's time to complain.

As I stated earlier, I decided to take the insurance settlement and buy a hand-held videogame unit. I found four to choose from: the Nintendo Game Boy, the Sega Game Gear, the NEC Turbo-Grafix Express and the Atari Lynx. Atari is the only American company of the four.

Ok, I bought a Lynx. On the bottom, it's labeled "Made in Taiwan." How can I buy American when we don't build anything here? How can I support American companies if they don't even have the pride (or guts) to build and/or assemble their products here in America?

I do own an American car (there are still two or three items built here). I can't even buy an American TV. The only American company building a TV is Zenith, but their TVs are assembled in Mexico.

A thought to all you unemployed people out there belly-aching. I'm tired of your whining. Quit complaining, band together to form your own small businesses, use American materials and labor and get some home grown products onto the store shelves and into the showrooms for me to buy. Enough said.

Trust me...I know what I'm doing.

If anyone asks, tell
'em you saw their
ad in AIM!

New! Version 2.41! With incredible Diamond SUPER faST Compression!! Faster Backups using 1/2 the disks with the NEW.....

Diamond Back II

Simply the FASTest, easily the most FLEXIBLE, and absolutely positively without question the most RELIABLE hard disk backup and restore program for the Atari ST!

If you own **ANY** other hard disk backup program for the Atari ST, then you can upgrade to Diamond Back II for only $30. **That's an incredible 40% off the retail price!** You can take advantage of this limited time offer by sending the original manual cover from your old backup program(no photocopies) and upgrade fee + $5 S&H to:

Please refer to AIM when ordering

Oregon Research Associates

Retail price: $49.95 Current Owners may upgrade to Diamond Back II V2.41 for only$10 from any version 2.20+ or only $15 from any version 2.11 or before (w/new manual). Please include your original disk with your upgrade order.

Subliminal Messages

Subliminal Messages

Subliminal Messages

I LOVE
my
ATARI

About every April you start hearing strange rumors. Some are exaggerations of the facts and some are total fabrications. The facts and rumors you are about to read should bring about awareness of a much greater conspiracy propagated by powers not yet determined.

When the 800 computer was designed, many factors were considered. Some of the most important were the human factors. The human factor considerations must have been extensive and well thought-out. The cartridge slot was placed where you could get at it. A switch was included so that when the top was opened, the computer would turn off to keep you from screwing up the cartridge.

Subliminal Messages

The joystick ports were put in the front so you could easily reach them. The RESET key had protection tabs so it was harder to press by accident. The power switch was placed where you could get at it. All these must have been considered to create a computer that could easily be used by a human being.

There is one other aspect that no other computer has that is not only a human factor but would have its psychological effect—the sounds that are generated when data transfer occurs. While listening to these sounds, you can tell if everything is going well. I have used other computers without this feature and watched the disk spin for five minutes waiting to load a program off a bad disk. Not with the Atari. One bad beep and the problem can be corrected.

But (and this is where we get to the crux-of-the-bisket), since human factors were taken into account, the designers must have known about subliminal messages. These are messages that are not perceived by the conscious mind, only the subconscious. (I remember a Columbo episode where a message was spliced into a film and made a person go out and get a drink of water so the killer could shoot him!)

I believe that underneath all those beeping sounds, a message has been superimposed. This message simply states, "I Love My Atari."

I know you can't hear it, but I think it is there. Think of the effect on your subconscious mind, hearing this every time you boot up. Day after day, month after month, year after year, your subconscious receives "I Love My Atari." This would create a group of people so dedicated to these computers that even the thought of using another computer would create mental distress.

Changes in my life started me thinking there may be some truth to this. When I first got my computer, it was hooked up to a color television with sound. Those first few months were great. I would get home from work and turn on the computer. It was on until 3AM. I would not have gone to work except I knew someone had to pay for the next program!

Then came the new monochrome monitor. This one had no sound. Slowly, I became accustomed to daylight. I laughed, I sang, I even talked to other people. But still, I could not pass by an Atari computer store, and it was a year before I could sit in front of another computer and type.

Now, a color monitor with sound is sitting near my computer. I find myself again becoming introverted. Three months without sleep later, I knew there had to be a reason.

If you know of anyone showing a high degree of loyalty to their computer, see if you can get them to turn down the sound while booting up. Then observe the changes in personality. These people are easily recognizable.

When showing them the high resolution graphics screen of the newer computers, they mumble, "I Love My Atari." Ask them if they have heard about the high clock speeds of other computers and they say, "I Love My Atari." Or, if you're their spouse, they say, "I Love you Dear, and my Atari."

Recordings have been made and are now being analyzed for these subliminal messages. As soon as proof of this can be found, many people will have much to answer for. But even after this conspiracy is proven, I think I will still love my Atari.

David Plotkin
Contributing Editor

Once you have had a taste of teleconferencing with Atari owners that you will in all likelihood never meet face-to-face... you will never want to go back.

I remember my first encounter with the more-or-less mysterious world of telecommunications. It was quite a few years ago, at a West Coast Computer Faire in San Francisco. GEnie (General Electric's "online service," a nationwide bulletin board) had a huge booth where they were showing the wonders of what you could do on GEnie.

I wandered into the booth for a reason that has since slipped my mind (since I had absolutely no interest in telecommunications) and was instantly cornered by Darlah Pine—one of the best known of GEnie's SysOps (system operators—the folks who take care of the bulletin board). She began to expound on the neat stuff you could do on GEnie. I remember my comment at the time: "I'll never spend my own money to join a BBS." She just smiled and walked away.

Because, you see, in those days, the nationwide BBSes (bulletin board systems) were expensive. Not only was there the cost of what was usually a long-distance phone call, but the system itself charged something like $18 per hour just to be logged on. What with weekly conferences to discuss life with other Atarians, electronic mail and literally thousands of neat files you could download, it didn't take very long to run up one heck of a bill.

Remember too, that 300 baud modems were the fastest things going in those days, so downloading a good sized file could literally take hours. My word, it was often cheaper to go out and buy the file from someone or to get a commercial version of the same thing.

There was the matter of hardware costs as well. Modems cost between $100 and $200 for 300 baud, $400 to $500 for 1200 baud—and the higher speed was only good if you could find someone else who also had one of those fairly rare 1200 baud modems. Certainly the online services charged more money if you logged on at 1200 baud.

And it wasn't just the cost of telecommunications that put a damper on things, either. Telecommunications has its own language—baud, stop bits, parity and other such nonsense. Further, you couldn't safely ignore any of this because it was all necessary if you hoped to have a prayer of actually receiving or sending a file to someone.

Significant time to learn the idiosyncrasies of telecommunications and to experiment was needed. Often, the only way to get something to work was to try a variety of different things until something worked—then write down the procedure for the next time.

Better with Age

As the years have progressed, things have gotten quite a bit easier. A variety of factors have brought the cost of telecommunicating down considerably.

One change was a reduction in cost of the popular national services. GEnie, for example, dropped its fee to $6 per hour during off-peak hours. For a flat $4.95 per month, you can use the "Basic" services—such as e-mail, without the hourly fee. Delphi has a similar system, although I'm not sure of the details—my account on Delphi is picked up by someone else that I write for, and I haven't inquired into the details. CompuServe has recently announced a Basic service plan of their own as well.

I suspect competition for the telecommunication dollar has helped. IBM and Sears joined forces to provide Prodigy. With the massive marketing muscle of these two companies, it has done quite well. It is very inexpensive because part of the cost is picked up by advertisers—across the bottom of your screen, advertising messages scroll by. These can be obtrusive, but it does keep the cost down.

Recently, Prodigy has been the center of a tempest because certain private messages have allegedly been censored by Prodigy. Their rationale? It's their system, and they can do what they like. Which is hard to argue with.

Another recent arrival is America Online. It started out strictly for Apple and Mac users (I got on using Spectre) but has since expanded. It is also very reasonably priced.

Another blow to the difficulties of telecommunications is the steep drop in modem prices. Modems allow digital data from your computer to travel over phone lines that are actually designed for analog (voice) data. Like most other things in the computer world, their price has fallen.

300-baud modems don't even exist anymore, and 1200-baud modems are around $50-$100. 2400 baud modems are around $100-$150 if you shop around, and 9600 baud modems are even now falling into the range of affordability. The faster, cheaper modems have made using BBSes more affordable by cutting down on the amount of time you need to be logged on to get your work done.

Finally, telecommunications software has gotten much better. Not only can many BBSes detect your communications parameters and adjust, but point-and-click interfaces have made it possible to simply follow a set of instructions (e.g. set 7 bits, 1 stop bit, even parity, Xmodem 128 byte blocks) by clicking on a set of buttons. Anyone can do this, without having to understand anything about the terms.

In the Atari ST world, Flash, Interlink and STalker all have strong followings, though I would venture that Flash is the most popular by virtue of having been around the longest—although it is no longer supported since Antic Software went out of existence. *[Ed: Flash II is currently in beta testing and will be released by MissionWare Software soon.]*

Since telecommunications has gotten so much easier and cheaper, should you consider getting involved? You bet. Once you have had a taste of teleconferencing with Atari owners that you will in all likelihood never meet face-to-face, benefitting from their experience, offering others help they would never have gotten otherwise, and "meeting" luminaries like Dave Small, Jim Allen, Charles Johnson, John Eidsvoog, Nathan Potechin, Bob Brodie, John Townsend, Sam Tramiel and many others, you will never want to go back.

The benefit, you see, is that you will no longer be cut off from others who share your interests, even if the nearest Atari dealer (it's hard to type that without smiling) is 500 miles away. If you are having trouble with some software, or just need advice, you can post a message in one of the dedicated areas on an online service and there will more than likely be an answer the next day. And, you can do this even if it is 2AM—you certainly can't call a company's software support line (if there *IS* one) at that time.

So, telecommunications can become your gateway to knowledge and help. As CompuServe (the biggest of the online services) says in their ads: *Don't be a solitary Atari. See you online!*

COMPUTER BULLETIN BOARD 445-1313

CompuServe puts the whole world at your fingertips.

When you connect your computer to CompuServe, you join the world's largest international network of people with personal computers. You have access to more than a thousand services that offer a source of support, information, entertainment, communications, and benefits of all kinds.

A world of advantages.

CompuServe lets you take advantage of your personal computer in a thousand different ways.

For instance: communication. You'll get invaluable personal computer software and hardware support from other CompuServe members, as well as product manufacturers, all over the world. Meet in special interest forums to discuss everything from science fiction to sharing software. And keep in touch through electronic mail and faxes, as well as by "talking" over 72 CB Simulator channels.

CompuServe also lets you shop coast-to-coast at hundreds of nationally known stores and take advantage of a world-class reference database. It gives you access to the latest national and international news. And our special financial files offer complete statistics on over 10,000 NYSE, AMEX, and OTC securities. You can even trade online with local discount brokers.

Global travel and world-class fun.

CompuServe also offers airline schedules, so you can check out the bargains and book your own flights on almost any airline worldwide. You can get travel news, frequent flier information, and country and travel facts. As well as listings from over 30,000 hotels.

Plus, there are games. Sports, trivia, educational, space fantasy… you can go it alone or compete against players from all over the world. Only on CompuServe can you test your wits in the only online TV-style game show with real prizes, or leave the earth entirely in one of our interactive space adventures.

Just give us a call.

To become a CompuServe member, you need a computer and a modem. We'll send you everything else, including a $25.00 usage credit with your Membership Kit. In most places, you'll be able to go online with a local phone call.

To buy a CompuServe Membership Kit, see your nearest computer dealer. To receive our informative brochure or to order direct, call us today.

And put the whole world at *your* fingertips.

An Interview with CompuServe's Ron Luks

Patricia Snyder-Rayl

WordPerfect

[Ron Luks is the manager of the Atari Forums on CompuServe and is a long-time supporter of Atari computers.]

AIM: Howdy, Ron!

Ron Luks: Hiya.

AIM: Ron, can you explain for our readers what CompuServe is? I'm sure many are familiar with a local BBS, but what all does CIS offer?

Luks: CompuServe is an international commercial information network with thousands of local nodes that members can call into to access a wide range of informational and entertainment services. The CIS Forums are among the most popular services offered on the network. At last count, there were over 300 forums on CompuServe, including the five Atari-related forums.

AIM: And these forums are places where users can chat with each other and download files? Are there other services CIS has?

Luks: The Forums are composed of 3 areas: Messages bases (18 per forum), data libraries for downloading/uploading files and CO (conference) rooms for interactive communications.

The CIS forums can usually support up to 300 simultaneous users, although typically there are less online at any time. In some circumstances, CIS can set up an Electronic Convention center (an expanded CO) that can accommodate up to 600 simultaneous users.

AIM: Wow! That's a lot of people!

Luks: CIS uses over 40 networked mainframe computers for the information service. Our other online services include a comprehensive EMAIL facility that is connected to the forums (You can send EMAIL from inside a forum), FAX facilities, hardcopy US-Mail, sending of binary files of up to 512K and mass mailing and distribution features (just added). CIS has the usual assortment of newswires, weather, stock quotes, online games, an online encyclopedia, etc. There are over 500 products available online.

AIM: For example...if someone wanted to find out what the price of Atari Stock was today, how would he or she do that on CIS?

Luks: That's easy. Stock quotes are available from almost everywhere on the service. Inside a Forum, for example, just type the QUOte command and you will be prompted to enter the stock symbol—ATC in this case.

AIM: There's a lot here. Now that we've touched on the basics of what CIS has to offer, I understand there's a basic fee structure. Can you tell us more about that?

Luks: Historically, CIS has charged a per-hour fee to access the service. This fee varies with the baud rate (higher speeds mean higher per hour fees, although they are more economical when you measure usage by the amount of info sent over the modem). Recently, CIS took some of its most popular basic services and made them available for a flat-rate monthly fee. You can get a list of these services with the command GO NEWBASIC. Other areas not included in the BASIC services plan are available at the usual hourly connect rates. There are ongoing discussions about putting together other flat rate packages, but I don't have any more info on these at this time.

AIM: If such a flat rate package were put together, would it include the Atari Forums?

Luks: I'd very much like to see a flat rate package plan available for the Atari Forums, and that's one of the things we're working on. That's all I can say about this at this time.

One important point about the flat rate plans: They are options for the member to choose or refuse. No users are obligated to accept a flat rate plan if they don't feel it is to their advantage. CIS is sensitive to the fact that everyone uses the service differently. Older members can elect to adopt the flat rate plan if they want, and new members can reject it if they don't want it. My understanding is that future plans will work the same way.

We have over 925,000 members worldwide now. (That's 925,000 accounts. CIS does not use the accounting method used by some other services whereby they multiply their actual accounts by a figure like 1.6 users per account to come up with inflated membership totals.)

CIS is rapidly expanding access in Europe, the UK and Australia. At the present time, we are adding local nodes in those countries and significantly reducing hourly surcharges. For example, in certain parts of the UK now, members can log onto CIS at the same rates as US members during non-prime hours. There is a small prime time surcharge (that is also getting reduced). USA and Canadian members don't have to worry about prime time versus non-prime time rates. We don't charge a surcharge just because someone wants to use the service during the business day.

AIM: Does this mean people calling in to the Atari Forums from the US can trade messages and even downloads with Atarians all over the globe?

Luks: Exactly right. In fact, we've opened a section in AtariArts called "Atari International," and we have many members logging on from Germany and the UK, including the general manager of Atari UK, Bob Katz. We are receiving a lot of new uploads from overseas lately.

AIM: Do you have any figures on the number of people who use the Atari forums?

Luks: I'm not allowed to go into too much detail about the demographics of the forum users, but I will say that we have over 30,000 active members in the Atari forums. And this figure has been increasing lately as we expand our European access.

AIM: That's great! I believe the CIS Atari forums have been around on CIS for a long time. Can you tell me how long?

Luks: I'm proud to say we are celebrating the 10th anniversary of the Atari forums on CIS. The original SIG*ATARI for 8-bit users opened 10 years ago.

AIM: Ten years! If you started with one forum, what has the Atari support grown to? You said five forums? What are they?

Luks: Right now, we have the original Atari 8-bit forum (ATARI8) which covers the 8-bit classic line and has a newly expanded section for the Lynx game machine. We have Atari Arts (ATARIARTS) and Atari Productivity (ATARIPRO) for the ST/STe/TT line. AtariArts covers games, graphics, MIDI, news and on-line magazines like ST-Report and Z*Net Online. Atari Pro covers utilities, applications, hardware, telecommunications, etc.

The AtariVendor forum (ATARIVEN) is a different type of forum where the main software and hardware vendors in the Atari community maintain their own message sections and libraries. The list of vendor areas

Time Savers!

New! LogoLibrary™

FLOWERS For All Occasions
RESTAURANT

LogoLibrary consists of over 1060 images for desktop publishing. Includes over 600 printer's logos for business advertising, stationery, etc. In addition there are 460 symbols and graphics for charts, posters, shirt designs, signs, etc. All images are hi-res 300 dpi graphics in .IMG format for PageStream, Touch-Up, Calamus, Publisher ST. 6 d/s disks & 72 page directory. $39.95.

Qwikforms™ for PageStream™

The key to quick and easy, professional-looking forms and documents is Qwikforms™, the only package of business and personal forms with over 100 different, adjustable layouts. Just choose the one you want, insert your name, logo, or text, and print. Business forms include invoices, inventory control, real estate forms, job estimates, applications, organizers, ledgers, charts, etc. Page layouts include newsletters, letterheads, business cards, brochures, booklets, envelopes, press releases, resumes, etc. Legal forms include wills, deeds, claims, bill of sale, power of attorney, etc. Personal forms include announcements, cards, architectural symbols for home planning, mail lists, invitations, etc. There are also guides and many other unique and unusual uses of PageStream. Includes 2 free disks of PD clip art, symbols and logos, and other useful desktop publishing accessories. State which computer you have. $39.95

Cliptomania™ 10 full d/s disks of hi-res PD clip art in .IMG format for use with PageStream, Publisher ST, Touch-Up, and Calamus. Categories include Advertising, Animals, Cartoons, Fantasy, Holidays, Letters, People, Restaurant, etc. Over 360 images! $39.95

Templicity™ Home and Small Business Spreadsheet Templates for LDW and VIP Users!

Now you can instantly use your spreadsheet to calculate and analyze mortgage rates, do your bookkeeping, calculate your income tax, estimate the maximum affordable price for property, design a savings program for education, count calories, create invoices, etc. This package of 104 prefabricated spreadsheet templates covers everything from accounting and budgets to inventory and real estate. Tax templates are upgraded each year for $5.00. Available in separate versions for LDW Power and VIP Professional. $39.95

All other-$5.00

includes Precision Software, Maxwell CPU, ICD, Gribnif Software, Lexicor Software, Soft-Logik Publishing, Double Click, Gadgets by Small, CodeHead Software and ISD Marketing.

And, finally, we have the Portfolio forum (APORTFOLIO) which is the official support site for the Portfolio line.

AIM: Didn't you just have a "marathon" in the Portfolio forum? What was that about, and how did it go?

Luks: The Port-a-Thon was a 24-hour online marathon where forum sysops and Atari staff members were available around the clock in the CO to answer questions and provide help to Portfolio owners. We gave away over 80 prizes during the Port-a-Thon and had members logging on from all corners of the globe. I'd say it was a huge success. They are already after me to do it again, but I need a rest. I spent 22 hours at the keyboard, and after awhile, my eyes started to cross. (heh heh)

AIM: Was anyone else there for the full 24 hours?

Luks: Don Thomas, the Portfolio Product Manager from Atari made it the full 24 hours. Other Atari staff participating were Dan McNamee, J. Patton, Mike Fulton, Bruce Coleman and Carl and Gail Bacani.

AIM: I understand there's a discussion about networking STs together in the ATARIPRO forum. Can you explain the topic there?

Luks: Sure. I admit I have a big personal interest in this subject, which is why we opened the section about a month ago. (By the way, we're always open to members' suggestions for creating new sections and topics.)

My wife recently upgraded her PC to a 1-gigabyte hard drive, and her system also has a big tape backup, a CD-ROM player, a laser printer, etc. Since we have two offices in our home, I wanted to find a way to share her expensive PC peripherals with my Atari system. Since I didn't know where to begin with the task, I opened the NETWORKING section and asked our expert members for help. It turns out that I wasn't alone in wanting to hook up an Atari to a PC system to share peripherals. There was a huge amount of interest in the idea.

Most of the networking systems for the Atari were available in Europe with little information available in the States. Fortunately, with our expanded European access, many folks from the UK and Germany joined the discussion, and we've all learned a lot about what the Atari can and cannot do in this regard. The discussions are still going strong.

AIM: This sounds like a perfect example of what online information services are all about.

Luks: Exactly!

AIM: Since you mentioned your wife, can you tell us more about yourself and your family? How did you get involved in computers (Atari specifically)?

Luks: I bought my first Atari 800 at the end of 1979

" The ultimate game design environment for use with GFA BASIC."

GP_GRAPHICS ENGINE

Using GFA BASIC 3.5 or greater and the powerful GP_GRAPHICS ENGINE products you can design almost any type of game on any Atari ST/STe. Whether you've never designed a game before or you're a experienced programmer, awsome demos, killer games and much more are all within your reach. The core of the GP_GRAPHICS ENGINE is a super fast, ultra compact 68000 machine language interface that handles almost every aspect of your game for you automatically. The best thing about the GP_GRAPHICS ENGINE is that it is totally compatible with the superb GFA BASIC INTERPRETER so you don't have to give up that interactive debugging process. The GP_GRAPHICS ENGINE means power. The following features are handled automatically by the engine. Pattern movement, offset movement, frame animation, collision detection, auto sprite tracking, direction movement, missile firing, boundary control, color cycling, color flashing. Unlike other game development languages your not limited to the number of sprites you can have on the screen at one time. Typical GP_GRAPHICS ENGINE games will have dozens of animated, collision detected sprites moving about the screen with virtually no slow down! Included with the package is a library of support routines to handle almost every aspect of your game including digitized sound, sound effects, character graphics with map/room design. Picture loading with multiple screen handling and video shows/fades. Four arcade quality games with step by step tutorial documentation. Suggested retail price only $69.95. Send a S.A.S.E. + $1.00 for our demo disk. Send $7.95 for a GP_GRAPHICS ENGINE VHS DEMO.

GP_SPRITES 2000
A collection of over 2000 sprites designed for immediate use in your game creations. Comes with some new animation ideas!
$29.95

GP_FONT PACK #1
Multi colored fonts in various sizes to add superb text displays to your game. Fully programmable with the GP_GRAPHICS ENGINE.
$29.95

GP_SOUND PACK #1
Add superb sampled sound effects to your games. Lasers, shots, explosions, arcade sounds, special effects, voice overs, AWSOME!
$29.95

Buy any of the above packages before June 1st, 1992 and get 40% off! Buy all 4 at once and get %50 off!! Call for details...

24 HOUR VOICE MAIL HOT LINE:
(817) -450-1109

because I was hooked on the Star Raiders game. The store sold me a modem and said that when I get bored playing games, I should try calling BBSes in New York City. I stumbled onto CompuServe, and when I couldn't find an Atari-specific area, petitioned CIS to open one. In 1981 they called me, and asked me if I wanted to run one. At the time, I was working on Wall Street, and computers were just a hobby. In 1983, I left the stock exchange and turned to computers full time.

I met my wife, Dawn, through a mutual friend in 1985-86, and she started on CIS with her own forum (the Consumer Electronics Forum). Although we both work on CIS, we didn't meet on CIS.

AIM: So, she was already involved with computers when you met? She didn't feel like a "computer widow" like many people? (grin)

Luks: Dawn was a Consumer Electronics journalist. When we met, she was working as an editor at Hearst Electronic publications for Neil Shapiro, the CIS Apple/Mac SysOp. I was having lunch with Neil one day, and when I went to his office to meet him, Dawn was there and he introduced us. When she walked out of the room, I told Neil I was going to marry her....

And two years later, I did. (grin)

AIM: And you have a little girl, right?

Luks: We have a 10-month-old baby daughter, Jennifer.

AIM: Back to the Atari forums...the APortfolio area is an official support area for Atari Corp. on CIS, but the ST and 8-bit (Classic) areas aren't. How has that affected the forums over the years (if at all)?

Luks: It has affected the forums. Obviously, when we first opened, CIS was the only information network that had an Atari presence. When GEnie opened, they were designated the official support area by Atari, and they offered much lower rates. So, I can't say which factor was the main reason behind our drop in activity initially. I will say that, with or without Atari Corp's "official sanction," we have enjoyed support from various Atari personnel over the years. At times, the forums and Atari Corp. have been "at odds" with each other, but I'm happy to say that relations are better now than they have been since 1985.

We're very proud that we represent the best interests of our members first and foremost. Without going into specific episodes from the past, I think Atari Corp. realizes that what is best for Atari users will ultimately be what's best for Atari Corp. This change in attitude is something I've noticed in the past year or so, and I think it's a great step. As an Atari customer support facility, I think the forums provide a valuable service to both Atari customers and Atari Corp. We have a number of joint promotions in the works for the months ahead.

Let's face it, the Atari marketplace now is so small, it's no longer a matter of "users vs. the company." If Atari is going to stay in the computer business, we all better be working toward the same goals.

AIM: Well, to wrap this interview up for us, what plans do you have for the Atari forums for the future? Where will these forums be heading?

Luks: Let me answer that by saying that I've always tried to be open and receptive to what the users want the forums to be, so for the most part we try to let them guide the direction of the forums. As an independent support service, we will remain open as long as there are interested Atari owners, no matter what direction Atari Corp. takes.

The 8-bit forum is an example of this. Although Atari Corp. dropped the 8-bit line some time back, we will keep the 8-bit forum open as long as we have interested members. The same will go for the ST/STe forums. Even if this line is dropped (not that I know anything you don't know), we will remain as an aftermarket support service.

CIS is rapidly expanding outside of the USA, and we expect to see this as our largest growth area in the near future.

Atari Corp. is at a very critical junction (in my opinion) in that the ST has been around for seven years and the STe is basically the same technology. The initial introduction of the TT was "less than gangbusters," and while the STBook is a cute unit, it's still basically an ST. The Portfolio has carved out a profitable and strong niche in the palmtop market, but that market is growing by leaps and bounds. Bob Brodie has alluded to some strong moves and some terrific new machines, but until they become reality, I think a lot of Atari owners and Atari watchers have adopted a "wait and see" attitude.

So, to get back to your question of what's in the future for the Atari Forums on CIS? More of the same independent service and support we've provided for the past 10 years, with some expanded coverage and access outside the USA. And, hopefully, some interesting pricing plans as an alternative to the present hourly structure along with the flexibility to expand or adapt to whatever Atari Corp. does in the computer marketplace.

AIM: Thank you, Ron, for taking the time to talk with me and the readers of AIM!

Luks: My pleasure.

GEnie

John Peters

Whoever thought of giving the name "Bulletin Board" to a computer system which can be accessed by other computers couldn't have come up with a more descriptive name.

With a local phone call, you can "post" messages, want ads or announcements just like you would on a conventional cork bulletin board. However, unlike the cork board, you can also find out what's happening around town, download the latest shareware/PD software, have a friendly "conversation" with your neighbors or even play an online game.

Now, imagine expanding this electronic Bulletin Board concept to include the entire United States. Better yet, bring in other countries like the UK, Germany, Japan and others. What you now have effectively describes the General Electric Network for Information Exchange, better known as GEnie.

GEnie is a multi-mainframe computer system accessible from most major cities in the United States and around the world. In the daytime, the computers are used by major corporations and banks to handle the tremendous computer workloads they produce. However, during the night, on weekends and many holidays, GEnie lowers its rates and opens the doors for "the rest of us" and becomes one of the largest Bulletin Board systems around.

But don't let the size of GEnie scare you off. GEnie isn't all that much more difficult to navigate than your local BBS. To make things easy to find, GEnie is divided into "pages." Each page is designated for a particular topic or activity which are called RoundTables. The easiest way to visualize what a RoundTable is, is to think of a RoundTable as a much larger version of your local BBS.

For example, the Atari ST RoundTable is located on page 475. To get there you would type M475 to move to page 475 (or you can simply type ST).

Upon entering a RoundTable, you are presented with a menu of several options. Option one takes you to the bulletin boards. Like all BBSes, the bulletin boards area is the heart of the system. Here, hundreds of messages are posted every day on just about everything and anything that concerns Atari.

Do you have a question for the CodeHeads? Would you like to discuss a new product with Double Click? How about Goldleaf, WizWorks, Lexicor, ISD, Wuztex, GFA, Fast Technology, Gadgets by Small or Gribnif?

These and other Atari developers are all active in the ST RoundTable Bulletin Boards. And with GEnie, you have a direct line to all of them.

Of special interest to Atari users is Category 14 which is monitored by several Atari Corp. officials. What better place to get information on the latest developments and products than from Atari Corp. themselves? Better yet, you can ask (and get answers!) to your questions directly from Atari, many times in 24 hours or less.

Option two takes us to the "chat" area or, as it is called on GEnie, the Real Time Conference rooms (RTC). Unlike most BBSes, where you can chat with a single person, in the RTC room you can chat with hundreds of people. In fact, every Wednesday night at 10(EST) there is an Atari-party going on—and you are invited! On "come-as-you-are" nights, the RTC is a free-for-all (structurally speaking) where people just jump in and mingle with the crowd. On "Black Tux and Tie" nights, a guest is invited to discuss their new product or service and to take questions from the audience. (Afterwards, though, it's back to Atari-party time!)

Option three takes you to the ST library. Since uploading to GEnie is free, thousands of files are available for downloading with 10 or more files being added to the list on a daily basis. Utilities, word processors, games, pictures, commercial demos, online magazines—all of these and more are available for downloading. If it's public domain or shareware, chances are you will find it in the ST library.

And that's just the Atari ST RoundTable! There are RoundTables for photographers, writers, police officers, teachers, musicians, lawyers and doctors, to name a few. Some other areas covered are up-to-date news, weather and sports; real estate; religion; scuba; astronomy; radio and electronics; genealogy; science fiction; home businesses; movie reviews; stock quotes; online stores and magazines like Compute! and Computer Shopper. The list goes on and on...

What about games? Sure, GEnie has many single-player games similar to the ones you will find on local BBSes, but GEnie has taken the online game concept a step further. In Air Warriors you can take to the skies with up to 50 other pilots in a real-time air battle, complete with stunning graphics. Later, pull up a chair to a poker table and play some cards. Or maybe Backgammon, Reversi or Chess is your specialty? Adventure games? You haven't experienced adventure until you have tried a GEnie multi-player adventure such as Federation II, Stellar Emperor, Orb Wars or the ever-popular Gemstone III.

SHAREWARE & PD

A great PD catalog with great prices!

It's true! Our catalog offers full multi-line descriptions for over 150 double sided disks packed to the brim with the very latest public domain and shareware software—all archived to give you the most for your hard-earned money. Each disk is also protected by a virus guard to eliminate any worry about system problems.

Send $6.00 for your 80+ page catalog and receive a bonus $6.00 coupon for a complimentary first purchase. Our everyday low price is $6.00 per disk.

OakSprings Software

If GEnie sounds complex, it is. To the new GEnie member, moving around GEnie can be somewhat confusing. With a little practice, the command structure and menu system is fairly easy to figure out. However, thanks to Tim Purves, a long time ST programmer, there is now a much easier way to navigate on GEnie. Tim has come up with an amazing front-end program called ST Aladdin. ST Aladdin allows you to do much of your online work offline. That is, ST Aladdin automates many of the things that you previously had to do manually. This not only saves you time but money as well.

Speaking of money, local BBSes do have one advantage over GEnie—there is usually no charge to access them. However, GEnie may not be as expensive as you may think.

Several months ago, GEnie started up a new program called GEnie*Basic. For $4.95 per month (USA rates), you can access over one hundred different areas on GEnie during "non-prime" time (6PM to 8AM local time, plus *all* day on weekends and GEnie holidays). Many, if not most, of the non-computing RoundTables are included in the GEnie*Basic rate. Also available is News, Weather and Sports, the Grolier's Encyclopedia and all of the single-player games.

Play Chess? It's 10PM and there is no one around who will sit down with you for a game of Chess? GEnie has come up with the perfect solution. The multiplayer Chess game is now included in the $4.95 package!

Even more surprising, GEmail is also part of the GEnie*Basic service. This means you can send and receive all the GEmail you like for one low price. This feature alone is worth the price of admission to GEnie!

Exploring areas outside of the GEnie*Basic does incur an extra charge, but it's not all that painful considering what you get. The USA rates are $6 per hour at 300 to 2400 baud during non-prime time hours ($18 per hour prime-time). If you are not already on GEnie, you should take a long hard look at what GEnie has to offer.

To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XJM11877,GENIE and hit RETURN. The system will then prompt you for your information.

If you would like to receive an information packet about GEnie, call 1-800-638-9636.

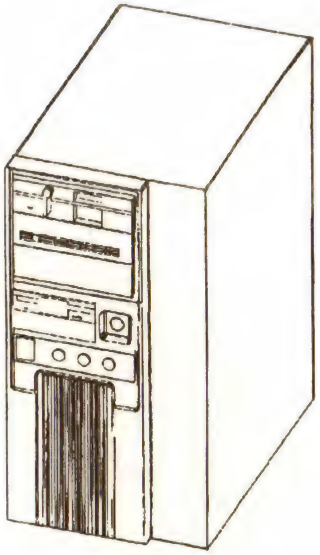
[About the Author: John Peters publishes the online magazine GEnie Lamp for the Atari ST, IBM, Macintosh and Apple II RoundTables on GEnie. John is also a SysOp in the Atari ST RoundTable. His GEmail address is GENIELAMP.]

PC

ST

Don't get caught in the middle

Feeling pressured to buy another computer just to survive in a PC world? Are emulators the answer ? Not really. An emulator just can't match the speed and flexibility of the real thing. But now you don't have to give up your easy-to-use Atari ST just to get PC compatability. Our unique ST/PC Tower Combo can give you the best of both worlds.



Features:

- Sturdy reinforced steel case
- 230 watt power supply
- Room for Back-to Back ST/TT and PC motherboards, plus three 5 ½ and at least four 3 ¼ drives
- Capability of integrating modems and other peripherals right into the case
- Use of independent monitors for each CPU or a single multisync monitor with the optional front-mounted switch
- Optional high speed interface to make peripherals and other resources like memory available transparently

Prices start at just **$295**(kit)

We ship COD ($4) or prepaid (5% discount) sorry no credit cards. Please add $25 shipping and handling. Houston residents and WILLCALL customers add 8.25%. Other Texas residents add 7.25%. Atari ST and TT are trademarks of Atari Inc. IBM PC is a trademark of International Business Machines Inc.

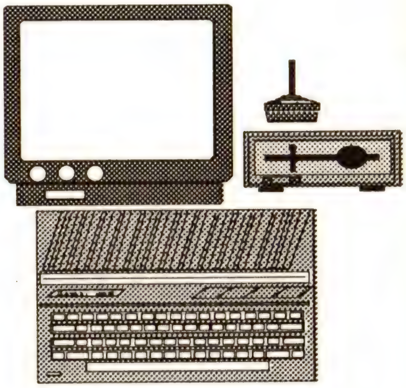
WRITING A BULLETIN BOARD ON THE ATARI 8-BIT
PART 1: INTRODUCTION



JAMES BASTABLE
BAPAUG

[Note: This article appears courtesy of 8:16, the newsletter of the Bournemouth and Poole Atari User Group.]

Let me tell you now, running a Bulletin Board is hard work and don't let anyone tell you different. But it's worth it. As a Sysop, you will make many new friends and gain a wealth of knowledge never before dreamed of, believe me. I have been running a Bulletin Board on the Atari 8-bit for over three years now and have never once looked back (people who know me will tell you different, but that was just my off days).

If you have an Atari 8-bit (and the necessary equipment) there is no reason why you cannot run a BBS (bulletin board service) on it. The machine is well suited for this. Even if you have now upgraded (?) to a new computer brand and still have your 8-bit, you could run a BBS on the 8-bit that was devoted to your new machine. That way you can leave your new machine free while still having a permanent link with other alike computer users.

This series of articles, split into four parts, will attempt to show the more experienced BASIC programmer how to go about writing a Bulletin Board. Contrary to popular belief, Atari Basic is quite capable of controlling a Bulletin Board of speeds up to 1200 baud which will suit most purposes. For higher speeds, I would recommend inclusion of machine code routines to handle input and output.

Anyway, let's get straight down to it. Before you start thinking about software you must have the correct hardware. Aside from your computer and tv/monitor, you will need a modem capable of Auto-Answer, possibly an RS232 interface and at least one disk drive.

The computer you use should have at least 48K of memory. All ready-to-run BBS software packages will need this and you will certainly need this memory if you decide to program the software yourself.

The Modem—I have had experience with three different modems—the WS-2000 with the Auto-Answer board fitted, the Miracom WS4000 and the Pace Linnet. In theory, any Hayes-compatible modem will be suitable. Atari's own SX-212 modem is Hayes compatible and connects directly to the Atari as an SIO device.

The Interface—To the best of my knowledge, all the available RS232 interfaces are suitable for bulletin board operation. I can talk from experience with the 850, the P:R:, the Datatari and one that Derek Fern sells (021-353-5730) in kit form. The Derek Fern and Datatari interfaces need a special software handler to be loaded before they can be used. This RS232 handler is in the public domain. Once this handler has been loaded, the RS232 interface is treated as a standard 850 Port 1.

Disk Drives—A modest Bulletin Board can be set up using just one drive. Using a RAMdisk, such as on the 130XE or the Rambo, will boost speed and storage capacity. However, you will find that two or more disk drives will be essential once you start adding public domain downloads to your Board.

I actually use the SupraDrive 20 megabyte hard disk, but its price will deter most people from buying it for a bulletin board on the 8-bit. As a matter of interest, I have recently made contact with a company in America which is selling interfaces for hard drives or complete kits ranging from five megabyte removable to 80 megabyte fixed drives.

For further information contact Computer Software Services, PO Box 17660, Rochester, NY 14617 Phone 716-586-5545.

Software

You have two choices for software. 1) Use an available bulletin board program, either commercial or from the public domain or 2) write your own. I favor the latter for reasons I will explain later.

In the public domain, I know of two programs that allow you to run a bulletin board. The first is ECABBS which is very basic and FoRem which was released in many different versions of complexity. Documentation for these two is sparse to say the least and for this reason I would not recommend them for the beginner. Having said that, most Atari bulletin boards in this country were run using FoRem with a certain degree of success. *[Ed: Here in the states, we also have AMIS (from the MACE user group) and AtariLink (a recent release). Both are written in BASIC.]*

On the commercial front, I know of only one BBS program, Bulletin Board Construction Set (BBCS for short) from the Antic catalog. As far as I know, this program is still available. BBCS, as with all Antic programs, comes complete with clear and precise instructions. The program is very powerful with some nice features but does have a tendency to crash now and then. For the casual bulletin board operator, this program is ideal. But, because of the crashing problems, the serious operator will find it unreliable. If a choice had to be made, I would recommend BBCS over ECABBS and FoRem every time. *[Ed: Commercially available BBSes for the 8-bit in the US include BBS Express Pro, Carina II and Oasis BBS.]*

This short overview of BBS programs explains why I decided to write my own software. At first sight, writing your own BBS seems a daunting task, but let me assure you this is not the case. BASIC programming experience, however, is essential. If you are a competent machine code programmer, you should have the experience to program your software with little difficulty.

This series of articles is aimed at the experienced Basic programmer who may think writing a BBS program is too complex (which it's not) or who does not have access to the appropriate information.

The major setback for most programmers is the mistaken belief that programming the 850 Interface (or anything that emulates it) is beyond their scope. I will present to you BASIC routines that I know work, but it is not my intention for this article to be a substitute for the 850 Interface manual. If you can get ahold of or already own the 850 manual, I suggest you use this article to complement it.

My own bulletin board runs purely in BASIC without a machine code routine in sight (except one which really isn't necessary but is there just to speed up a certain operation). I do use BASIC XE for ease of programming, but nothing else. Turbo BASIC can be used for the same reason and, of course, an increase in speed.

Writing a BBS program can be quite arduous, but not in the areas which prevent most from making the attempt. The program itself must accomplish three tasks:

1) Handling input and output from the Modem. The easy part.
2) Control a database of messages. Can be hard or easy depending on how many messages you want to store.
3) Be user friendly so as to allow the user to log on, do what he has to do and log-off in the minimum amount of time.

The above functions should be transparent to a caller, but what must be apparent is an interesting bulletin board. It is easy to be so involved with the programming aspect that you lose sight of the important part—the board must be interesting. There is nothing worse than going to all the trouble of creating a board only to find no one calls because you have not put enough effort into the layout and content of the Board.

Before I end this introduction to the series of articles, let me leave you with an example of how easy it is to use Atari BASIC with a modem. In the following routine I show you how to detect when any modem has answered a incoming call.

```
100 CLOSE #1 :REM To be sure.
110 OPEN #1,4,0,"R1:":REM Open to Port 1.
120 XIO 34,#1,0,240,"R1:":REM Configure the port.
130 STATUS #1
140 IF PEEK(747)=253 THEN REM Modem answered call.
150 GOTO 130:REM Modem not answered,retry.
```

There, that was easy. If PEEKing location 747 had equalled 253 then we know that someone has rung, the modem has answered and a successful connection has been made. To find this out, I used simple trial and error but when you find something that works, you stick with it. It is not important to know how the XIO command works, the fact that it does should be enough. However, I will go into greater detail later.

The second part of this article will deal mainly with XIO RS232 input and output commands. The third installment deals with handling incoming and outgoing data and the fourth with Xmodem file transfer. The articles will not write a bulletin board program for you but only aim to steer you in right direction.

Delicious Monitors!

The "TOAD RGB" Display

☛ These are the most popular monitors on our menu. And for good reason! The truly spectacular thing about the monitors (excepting the price) is that they support ***three*** kinds of inputs! They have an ST compatible *analog RGB* port, a PC-CGA compatible *TTL digital RGB* port, and a *composite video* input with separate chroma and luma too! Ponder it: using the same monitor on your ST, a PC compatible, an Atari Eight Bit or VCR! They even have an audio input and speaker! The monitors have a beautiful glossy twelve-inch screen and a picture quality which surpasses even the best SC1224 monitors! The monitors are reconditioned (but are factory fresh), and that means that we can offer a complete (parts & labor) six month warranty! The quantity is limited though, so order yours ***toaday!*** Specify cable for ST, Eight Bit, PC, or Cray X-MP.

TOAD-RGB Color Monitor: $239

MONITOR VARIETY!

Just Doughnuts?
Or Passive??

MONITOR EXCHANGE

☛ Do you have a broken SC1224 or SM124? SC1224's can be exchanged for the SC1435 for $239. A broken SM124 can be exchanged for a new SM147 for only $149!

☛ The Atari ST's have always been finicky about monitors. With a seemingly endless array of color monitors on the market (at reasonable prices, too), why should we be bound to Atari brand color monitors? That's a good question. The answer is that the Atari uses *analog* RGB and until very recently, *TTL (digital)* RGB was the norm. Now that the analog systems of VGA and Super VGA are more popular, the analog RGB monitors those systems require are more popular too. So you'd think the problem would be solved. Lo, a quandary still exists. Now, the mainstream monitors are too fast for the Atari's to use! Most VGA and Super VGA monitors have a fixed horizontal scan rate of 31.5KHz, and the Atari runs at 15.75KHz. So, while the RGB standard has changed in our favor, the speed issue is still boxing us in. So when you boil all this down, you get a relatively small set of monitors which will actually work on an ST. This set includes the Atari SC1224 (12") and SC1435 (14") monitors, a few "multisync" monitors (which have the ability to lower their horizontal sync rate to 15.75KHz), and the handful of monitors that, for whatever reason, were made with compatible specifications. We sell them all. If you like the Atari name brand monitors, (including the new SC1435 14" color monitor and the SM147 14" monochrome monitor) that's cool — we have them. We also have great deals on multisync and other compatible monitors, like the Magnavox 1CM135 and our own refurbished *Toad-RGB* color monitors. So weigh the options and see what fits you best. Any questions? Call the chef!

Spring & Summer

☛ Winter is slowly but surely giving way to the warmth and raw flavor of spring, and our Spring/Summer catalog will be out very shortly. The Spring/Summer catalog will be our biggest and best printing effort yet! We're moving, too! A tremendously large location is being prepared for us now, and we should be in this Spring! We're not moving far, though — just across the street! Call for more information. Thanks for your continual support. We appreciate it.

NEW Little-Toad-20 Drive

☛ We've had numerous requests to lower our standards. So we did. But we're doing so openly, so that those of you demanding the highest quality can still get the best products available worry-free. But we've got a cheap hard drive now, the Little-Toad-20, and it's a relatively decent 20MB setup, in a small portable case. Using the Supra Host Adapter and a 3.5" 20MB Drive, it's only **$299!**

GET OUR CATALOG

☛ For our complete menu listing, be sure to call or write us to get a copy of our most recent catalog and to be placed onto our mailing list. No Atari connoisseur should be without our insightful reviews of hundreds of Atari products. Call us at Toad Computers TOADAY to get onto one of the most hip-hoppingest mailing lists around today! Get postcards, catalogs and more! All you have to do is call!

Carina II BBS System v2.5 A Great 8-bit BBS

Phillip Keen
HACE

[Note: Excerpts from the Carina literature used in this article are done with permission of David Hunt and Shadow Software.]

Carina II represents an enormous step forward in the development of electronic bulletin board systems (BBSes) for the Atari 8-bit computer. It is an expandable, full-featured, customizable and easily modifiable bulletin board system that offers power to its users *and* its SysOp as well!

Carina II uses what are known as Special Interest Groups (SIGs for short). A SIG is like a mini BBS within the major BBS, which is Carina II. Each SIG has its own message base, database, file area, game area, voting poll, bulletin's, etc. SIGs are definable by the BBS Sysop to cover whatever topics he/she wishes. Carina II offers 26 SIGs with up to 255 messages on-line per SIG. The maximum number of files online is limited *only* by the size of the system, which means you may store as many files for download as your drives allow.

There are hundreds of on-line games available for the system, and many other types of external modules available as well. A couple of handy ones which come to mind are the On-Line Area Code Locator and the On-Line Biorhythm Analyzer. You can even run many non-BBS programs written in BASIC with little or no modification!

Carina Features

Among its other fine features, Carina II offers graphics support for ATASCII, VT-52, Color ANSI and Commodore Color Graphics. Some of the Commodore PetASCII screens are better than that of *any* Commodore BBS itself. Plus, with Carina, it is easy to offer almost any type of graphics online that the Sysop should desire. It is truly a very flexible system.

Now for the Sysop's options and support. Carina II is *guaranteed not to crash* (due to the fault of the program, of course)! On-line BASIC and SpartaDOS capability let you modify the BBS or do DOS activities from *anywhere,* with password protection for maximum security in accessing these Sysop Commands.

Nineteen modules (programs) make up the Carina II Bulletin Board System, with the Modem Operating Environment (MOE) and other machine language routines giving Carina II its speed.

SigOps (people with Sysop powers only in specific SIGs) and SysOps can write "form letters" where the current user's name (or any other item of the user's status) can be substituted in a specified location of a message or text file.

While the user is online, there is a full-page, multitasking Sysop window that allows the Sysop to modify the current user's status while they are online without them even knowing about it.

Software and Hardware

Carina II supports 300, 1200 and 2400 baud using any Hayes-compatible, XM301/1030, Supra or SX212 modems. And 9600 baud support is in the works. The software supports the R-Time 8 Cartridge (which is *highly* recommended due to SpartaDOS bugs in the date at the end of the month), ICD's MIO, the Black Box, 850 Interface, P:R: Connection, and possibly many other configurations as well. Carina II has a Printer Support Option and works with any drive that SpartaDOS supports.

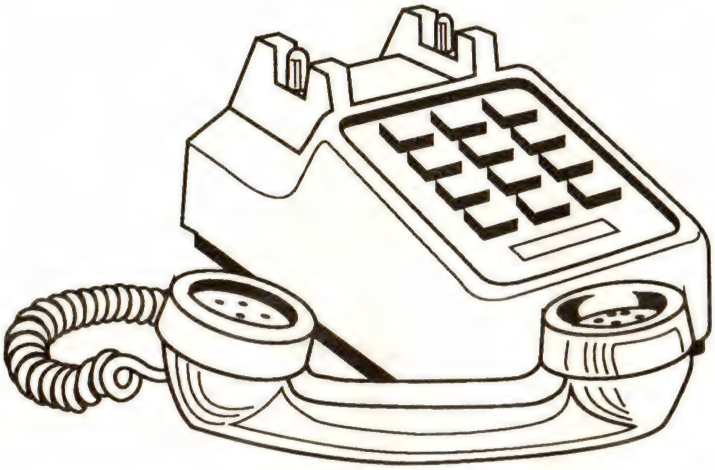
I have been working with computers for over 13 years and with bulletin board systems for over 11 years. Carina II is by far one of the best, if not *the best* BBS I have seen. It is very sleek, and if you do not like the present format, you can always modify it or use an option to style it to your own imagination.

Drawbacks to Carina

However, with any BBS program there are always a few negative points. Carina II is no exception. I dislike the SysOp's User Editor in the fact that two of the prompts in the Editor are so close to identical that it is easy to delete a user quite by accident. I did this once to one of my best friends and did not even realize it until he left me a message complaining that his login information would not work.

Another drawback is that Carina II is just a tiny bit slower working in local mode than it does remotely. Although it isn't hardly noticeable, I do notice it a tiny bit.

Carina II is also a bit more tedious and harder to set up than other BBSes in its class. It is not a system that can be up and going within an hour. It took me almost two weeks before my Carina II system was up and running perfectly. It would have taken longer if it were not for the help of Carina II's current author, David Hunt. He helped me out a great deal in setting up Carina II. Other than these few drawbacks, Carina II is a fine BBS program and I highly recommend it to anyone.



Carina Support

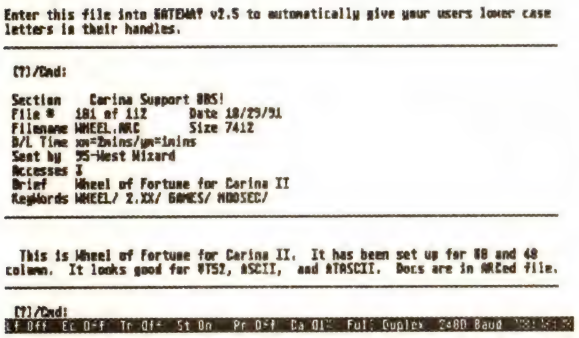
In addition to all the above, Registered Carina SysOps get *free* access to both US and Canadian support BBSes:

Atari Clerk BBS (713)941-5467 (3/12/2400 baud)
Ace Of America (503) 285-4417 (3/12/2400 baud and the main Carina Support BBS)!

The following has been excerpted from the Carina II sales literature, so you can see a few of Carina's fine features, and also how you may order the software.

Here is a list of *some* of Carina II's features not mentioned previously in this article:

- Maximum of 65,536 users
- Over 1,000,000 combinations of access
- Self-Compacting message bases
- 40/80 column support
- Page Breaks configuration
- File descriptions, keywords, etc. are displayed along with download filenames
- Files can be marked and downloaded using a batch protocol!
- The contents of ARCed files can be viewed when Browsing or doing a Directory of download files



```
Enter this file into GATEWAY v2.5 to automatically give your users lower case
letters in their handles.
--------------------------------------------------------------------------------
 [?]/Cmd:

 Section    Carina Support BBS!

 Brief    Wheel of Fortune for Carina II
 KeyWords WHEEL/ 2.XX/ GAMES/ MODSEC/
--------------------------------------------------------------------------------

  This is Wheel of Fortune for Carina II.  It has been set up for 80 and 40
column.  It looks good for VT52, ASCII,  and ATASCII.  Docs are in ARCed file.
--------------------------------------------------------------------------------
 [?]/Cmd:
LF Off  Ec Off  Tr Off  St On   Pr Off  Ca Off  Full Duplex  2400 Baud  [illegible]
```

- Six file transfer protocols include XModem, XModem CRC, YModem (1K X-Modem CRC), YModem Batch, C-Modem Batch and ASCII. Other transfer protocols are available
- Free upload time given
- Files can only be downloaded if the user has enough time
- Up to 26 voting polls can be online within each SIG (676 polls total)
- Message bases have full threading and "random access" capability
- Messages are tagged as "received" after the recipient has read them
- True Electronic Mail and Electronic File-Mail (files can be sent to individual users just like E-Mail)
- Databases and Games using submenus (up to 3,328 databases)
- Single-letter (hotkey) input now available as well as macros or English input!
- Built-in terminal program with file transfer capability
- Networking ability is available free! Multiple Networks to choose from!!

To run Carina II, you need SpartaDos 3.2 or greater and at least 500K of storage capacity. (Two XF551 floppy drives, for instance.) An R-Time 8 cartridge is highly recommended (it's nice to have an accurate clock and proper date setting).

Carina II was originally developed by Jerry Horanoff. The software is now owned and programmed by David Hunt, owner of Shadow Software, with modifications available from a wide variety of other Sysops who run Carina II.

Carina II v2.5 is now available for only $50 plus $5 S/H, and that is less expensive than it has ever before been offered. Shadow Software has been bringing you the best for *less* since 1979. In the Shadow Software tradition, with the purchase of Carina II, the price was *lowered* while support took a *large step forward.* There is now more support for Carina II than there has ever been in the past, and at a reduced price!

To order Carina II:

Turbo BBS for the ST

Steven Leser
P3ACE

I have seen write-ups on other BBS systems in AIM, so I had to write in to talk about my favorite, Turbo BBS.

Turbo BBS is written by Bill Miller. Version 2 of Turbo Board makes everything else out there seem second rate. Like Michtron advertised about its own BBS, Turbo 2 is *fully* user configurable.

You can set up your own menus and affix whatever function to whichever key your heart desires. You can also have Turbo 2 run *any* external program from any menu. With these options at your disposal, submenus, submenus within submenus, etc. are possible. (In fact, I have a Main menu for P3ACE members only on my BBS, with a separate games and utilities menu underneath that one. These menus are all in addition to the standard main menu and games menu that other users see.)

With Turbo 2, there is no cryptic scripting language to learn. You can accomplish basically anything using simple batch file commands in conjunction with the configurable menus.

Turbo 2 is modularly designed. Bill Miller realized he could not incorporate all the features he wanted in a standard stand-alone system and still keep memory requirements down enough for a 512K machine to be able to run it.

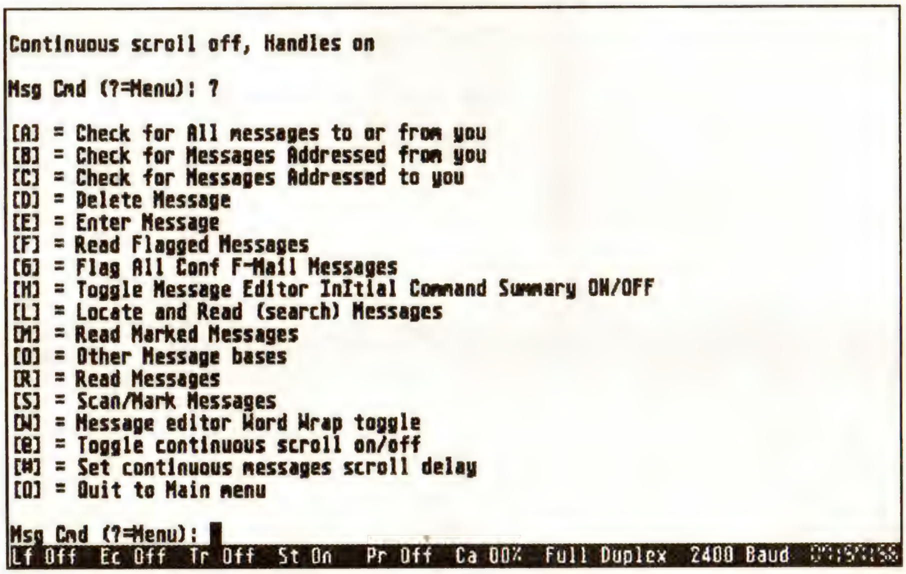
His solution was to create 11 separate system modules. When a user selects the file transfer area, for instance, the BBS exits the standard System module and loads the Files module. This opens up enormous amounts of memory for TSRs and more complicated games.

It also makes running Turbo with external mailers (i.e., Binkley for FidoNet) much more stable than under any other platform. Amazingly, switching between modules is lighting fast. My users never know the difference.

One of the huge advantages of Turbo 2 is its message SIG system. No longer are you stuck with one message area filled with multiple message bases. Now, you can organize similar message areas into SIGS.

For instance, my BBS is organized into seven SIGS. SIG 1 is a Local message SIG (with eight message areas), SIG 2 is a P3ACE SIG (with eight local message areas on Atari computers). SIG 3 is a FidoNet computer SIG (7 FidoNet network areas on Atari computers, anti-Virus topics, anti-piracy discussion, and more). SIG 4 contains FidoNet domestic issues! (8 message areas on cooking, crafts and various other domestic-type issues).

You can assign access levels to each SIG, and you can allow different people access to only certain areas within each SIG. This is probably my favorite feature of Turbo



```
Continuous scroll off, Handles on

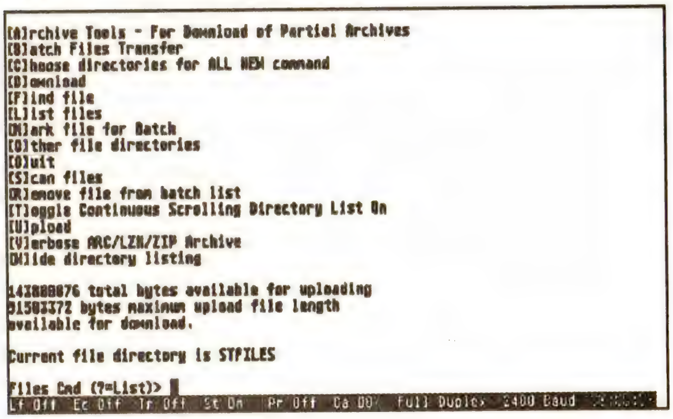
BBS. It is more of the RoundTable or Forum idea. As GEnie and CompuServe have proven, organizing common message areas in this manner is a much more comfortable scenario for the user.

Batch uploading is another wonderful feature! Users simply hate having to sit by their computers while uploading files one by one. Now, with batch uploading, the user can upload dozens of files at once and return near the end of the session merely to type in descriptions. Turbo offers Ymodem, Ymodem G, Sealink and Zmodem batch uploads!

Turbo BBS is also fully FoReM compatible, that is to say that virtually every program, online game and nifty doodad that works with FoReM will run on Turbo BBS. Turbo creates FOREM.DAT and DORINFO1.DEF files that most external FoReM programs and games look for when they run. Most of the online games being released on the ST are designed to be run under these platforms!

As the Millers say, Turbo 2 is simply the most advanced and powerful BBS system available for the ST, period! Turbo Board Version 2's additional features include:



```
[A]rchive Tools - For Download of Partial Archives
[B]atch Files Transfer
[C]hoose directories for ALL NEW command
[D]ownload
[F]ind file
[L]ist files
[M]ark file for Batch

40Mhz ACCELERATOR

SUPER FEATURES

- **Most compact 68030** accelerator available anywhere!!!
- Available to fit all Atari ST and Atari STE computers
- Uses Motorola's advanced "030" running at **40Mhz!!!**
- 8Mhz **68000** onboard for **100%** software compatibility
- Optional **68882** math co-processor running at **60Mhz!!**
- Optional virtual memory, for up to **128 Megabytes!!!**
- **Static ram cache** speeds all program/video operations
- Makes your ST or STE up to **6 times faster!!!**
- Full CMOS/SMD construction for maximum reliability
- Equipped with Atari's new TOS **2.0** operating system
- Bundled with Codehead Software's QuickST software
- Specially tuned for Mega ST/VME based **video cards**
- No auxiliary power supply required on any ST or STE
- Fully BLiTTER compatible
- Only 3.5" x 2.5" in size
- Some **desoldering** required on Atari ST computers
- Expert **Installation**, customization services **available**
- TinyTurbo030 599^{00}, FPU 299^{00}, Virtual Mem 299^{00}

FREEZE DRIED TERMINAL

Allan Coker
SWAG

FreeZe Dried Terminal (FzDTerm) is a shareware, non-GEM interface terminal program written by Aaron Hopkins. The program requires at least 1 meg of RAM, supports color and mono display and Flash! DO files (scripts). It includes a program to convert Flash!, Interlink, Stealth, DTerm, QTerm and VanTerm Autodialer files and Flash!, Interlink and VanTerm Macro sets.

The software has VT-52, ANSI, UBT-Graphics and Instant Graphics screen emulation capabilities. It allows the use of any transfer protocols in a easy to use shell that makes the protocol appear as a internal part of the terminal program.

The Auto-Dialer has 45 slots and supports redial and chain dialing, Auto-macros and auto-logon with auto-learn for each slot on the dialer. FzDTerm has a Capture buffer and a full-featured text editor and offers access to disk commands including floppy format and LZH/ARC/ZIP archiver shell support.

Some Thoughts

That's quite a list of features. Now that all of that is out of the way, here are my own opinions and observations on this program. First of all, I am an dyed-in-the-wool InterLink user looking for a terminal program with a scripting language that is as easy to use as InterLink.

While some may say that by not using GEM, FzDTerm is not an easy program to use. What the author has done, though, is written his own interface that is similar to that on a Sun workstation, complete with buttons that sink when pressed. Instead of a system of drop down menus, FzDTerm uses a series of screens that, after you get use to them, become second nature.

I use this terminal program with a local BBS at 14,400 baud and it has yet to miss a beat. I like the way transfer protocols are integrated so they appear to part of the terminal program.

And, if you wish to add a protocol that the author does not supply, FzDTerm can pass the parameters to the stand-alone protocol program, making it appear as part of FzDTerm. This way, as new protocols come along, you can use them with the program.

FreeZe Dried Software Presents:

/oftware

v2.11

Program and All Documentation Copyright ©1991 Aaron Hopkins
This program is Shareware. The Demo may be distributed freely.

In color, the screens are very striking, supporting things like multiple colors and shadows. In earlier versions, monochrome was not well supported, but that has been changed as of version 2.04. In version 2.10, auto-learn was added to Auto-Logon, which makes it a lot easier to create auto-logons for specific BBSes.

I find this program fits my needs and it is still a growing program. By this I mean that the programmer will make additions to it, as requested by the users.

If I have any complaints, it is the documentation. Even the author admits the documentation needs work and is requesting help in this. As we all know, writing of documentation is one of the largest and most thankless parts of a creating a program, one that never seems to make everyone happy.

Features I would like to see added are 1) at completion of contact with a BBS, if you were chain-dialing, start dialing the next BBS in the chain and 2) a mini-BBS. I know these can be added through use of script files. But, like many people, I am lazy...or I would have written my own terminal program!

FreeZe Dried Terminal is a commercial quality program, in my opinion. It is available from many BBSes, may be downloaded from the online services or can be purchased directly from the author himself. The cost to become a registered user is only $25. For this small fee you get the latest version of FzDTerm and a "key file." With this key file protection system, you only need to download the latest versions from you favorite source and you will have a full working terminal program. The author may be contacted at:

MaxiMiser and MaxiDoor

Allan Coker (SWAG)

MaxiMiser and MaxiDoor are two companion programs. MaxiDoor is a Door program that runs on a BBS and MaxiMiser is program that a BBS user runs on his/her ST.

Both programs are written by Shawn Smith of Ajax, Ontario, Canada, in compiled GFA Basic. They are compatible with the Q-Mail or MarkMail programs used on some IBM BBSes. What they do is cut your online time on a BBS from the usual 30 minutes or so to about six minutes. This is a real blessing on long distance phone calls. You will still need a terminal program to make the connection to the BBS.

MaxiDoor

MaxiDoor on a BBS takes all new messages in areas you are interested in—as well as a listing of all new files uploaded to the BBS since you last logged on and any Confmail files—and creates a compressed packet. This compressed packet can then be downloaded to your ST.

When you log off the BBS, your high message read counters are reset. MaxiDoor will run on FoReM, ///Turbo and Express ST Pro BBSes on the ST. Both MaxiDoor and MaxiMiser support ARC, LZH and ZIP methods of file compression.

MaxiMiser

MaxiMiser takes the compressed package and uncompress it, allows you see what new files are on the BBS and transfers the Confmail files to disk. It lets you read and reply to any captured messages at your leisure. Replies are placed in a compressed file you upload during your next connection to the BBS. MaxiDoor (on the BBS, remember) then uncompresses the messages and automatically places them in the correct message areas for you.

My description of the operation of these two programs just glosses over the total operation. Once you use the software, you will wonder just how you got along without these programs before. The worst problem you will now face in the world of BBSing is in making the connection to the BBS.

A Word about the Author

Shawn Smith has written a very useful program for the ST and has offered it to the world as shareware. He is only asking $25 to become a registered user, a very cheap price for something that works so well. He is willing to make addition and modifications to the program to fit the requests of the majority of his users.

MaxiMiser may be downloaded from any BBS that supports it. I understand that, while the author does request a fee from the user for MaxiMiser, he does not ask for a fee from BBS operators for MaxiDoor!

For the small registration fee, you get the latest version of MaxiMiser and a key file. With this key file protection system, you only need to download the latest versions from you favorite source and you have a full working program.

You may order MaxiMiser direct from Shawn Smith, 27 Carr Dr., Ajax, Ontario L1T 3E2, Canada or, if you are in Europe, from Ben Van Bokkem, at 100 Broughton Ave., Aylesbury, Buck, HP20 1QB, England.

Admission $6.00 • Advance tickets $5.00 • Children 6 and under no charge

A nominal charge of $1.00 to play the full range of Atari video games will be donated to The Hospital for Sick Children.

AAAUA ATARI 8-BIT USER GROUP

PRESIDENTIAL PONDERINGS by Alvan Sherrill

I acquired a presumedly public domain disk several weeks ago and finally got around to looking at it. Apparently, the disk had been circulatiing for the past 2 1/2 years on the bulletin boards. The screen opened with a menu with choices of music and scrolling text. I looked at the scrolling text and noticed a number of contradictions. First, the authors bragged about "cracking" the music files and expressed disdain for those who oppose "hacking" and "cracking". At the same time, they claimed their disk was public domain and urged the widest distribution of the disk. They stated that the text was heavily protected and warned against anyone trying to break into the scrolling code to enter messages for personal use. They had programmed at least one "boobie trap" to format the disk which had to be left unprotected to run. Apparently they felt programming was the exhaulted domain of the privileged few and should not be meddled with by mere users.

The programming was superbly done, reportedly by THE HIGH TECH TEAM of Holland, and illustrated what could be done on an Atari 8-bit XL/XE computer. Unfortunately the text of the scrolling messages was filled with profanity making it unsuitable to use as an example of Atari 8-bit programming, not to mention the possibility of pirated music files. Since the scrolling text was protected, there was no easy or apparent way the typical user could modify the scrolling for his own purpose.

What was the purpose of this time consuming and difficult programming task? Because of the protection, the programs cannot be used by anyone except as a crude example of excellent programming by anti-social minds. What a pity. Perhaps the HI TECH TEAM will read this and see another view of their juvenile power game that serves little purpose and perhaps choose to direct their considerable programming skill in a more socially acceptable and personally rewarding direction.

ACE of St. Louis

ACE St. Louis meets monthly at the Thornhill Branch of the St. Louis County Library located at Fee Fee and Willowick. The following is a listing of 1992 meeting dates and times.

Saturday March 28th, 1:30 p.m.
Wednesday, April 29th 7 p.m.
Wednesday, May 27th 7 p.m.
Saturday, June 27th 1:30 p.m.
Wednesday, July 29th 7 p.m.
Wednesday, August 26th 7 p.m.
Saturday, September 26th 1:30 p.m.
Wednesday, October 28th 7 p.m.
Wednesday, November 25th 7 p.m.
Wednesday, December 30th 7 p.m.

Editor	Terry Shoemaker

ACE St. Louis is a member of the Midwest Atari Regional Council (MARC).

ATARI COMPUTER OWNERS RESOURCE NETWORK
FORT WAYNE, INDIANA

Bob Kelley opened the business portion of the meeting by discussing plans for our Three Rivers Festival (TRF) event. Bob attended the kick-off meeting of the TRF Committee and had a couple of forms available for those ready to sign-up to help. We discussed moving the location of the event to the downtown library but the high sound level would probably not be acceptable.

Atari news was also discussed including Atari's presence at NAMM and Computer Chronicles planned program on the event. Atari is advertising now in Discover magazine. Supra has introduced a couple of inexpensive 9600 baud modems. Karl Fadus demonstrated Spectre GCR, the Macintosh emulator for the ST. He showed how to boot it and run an application like Hypercards and a game he had. Kim Stahn brought a Fujix P-40U Video Projector and had it connected to an ST. It seems to work but there was too much light in the room to see the projected image clearly though it is supposed to be able to project a 40-inch diagonal picture clearly.

Adam Kelley demonstrated VROOM, a racing game for the ST that supports a two-player play-by-modem feature and can be played using either the mouse or joystick. Mike Surface demonstrated Vengeance of Excalibur, an adventure role playing game set in Spain from Virgin Games, and Lombard Rally, a road race game.

ASTMUM
ATARI ST/MEGA USERS (Montreal)

Our users' group consists of MIDI musicians, composers, videographers, artists, writers, technicians, students, teachers and business people. We also welcome new members, interested in learning about the ST/MEGA (even STE, MEGA STE and TT) models, and their applications, before purchasing.

Founded in 1987, ASTMUM provides its productivity-minded members with technical support, training and emergency assistance (24-Hour, Repair Hotline), laser printing and graphics services, as well as discounts (through participating dealers) on original software, computer hardware and music industry-related equipment.

To benefit its members, and the visiting public, our group has participated in these shows and expositions:

CEGEP Rosemont AtariFest, Montreal, September '88
WORLD OF ATARI, Dearborn, MI USA, June '89
PRODUCTION '90, Montreal, May '90
SIIM '90, Montreal, June '90
Windsor/Detroit International AtariFest, May '91
PRODUCTION '91, Montreal, June '91
SIIM '91, Montreal, June '91
WAACE AtariFest '91, Reston, VA USA, October '91
Chicago ComputerFest, Rosemont, IL USA, November '91

We have kept our members informed of Atari's progress on their most recent models (TT, MEGA STE, ST Book and STylus) through our large periodicals library, videotaped show-tours and interviews with software and hardware developers.

Encouraging members to form special interest groups, we hold monthly meetings (usually the last Sunday of each month) and offer seminars and demonstrations.

Some members teach others, in "hands-on" recording studio environments, at generous discounts. Masters of piano tuning, computer repair and instrument restoration work their magic. Incoming members are impressed by the efficacy with which our specialists troubleshoot the previously unsolvable. Even singers find help for their vocal problems!

In addition to helping ASTMUM musicians market their CDs, LPs and cassettes, at exhibitions and retail outlets, we have assembled a "sampler" cassette highlighting some of their work. You can order this extraordinary, chromium dioxide wonder (ASTMUMusic Sampler, '91-'92) for $12.00 postpaid! Please specify your choice of noise reduction: Dolby B, Dolby C, DBX or Super D (this list will get longer because at least one, new, noise reduction system will be introduced this year). Make your Money Order (in U.S. dollars if you live in the U.S.A.) payable to K. Carter-Morgan and send it to our address, below. Your return address should be complete and clearly printed.

If you use your Atari in creating or performing music, and would like help in launching and publicizing an independent release, our group may be just the ticket.

Membership information, advice, product list and sampler cassettes may be obtained by writing to:

ASTMUM, Attn: K. Carter-Morgan P.O. Box 966, Station B
Montreal PQ Canada H3B 3K5

or by phoning (514) 272-6631 (voice only)

Executive Exhortations by Kest Carter-Morgan:

First, members are advised that we are developing a super-quiet, semi-portable, 105 Meg. hard drive system for musicians. Those members wanting in on the quantity purchase benefits of this project should contact me immediately.

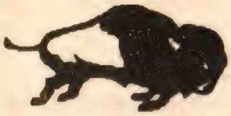
Second, I want to thank those ASTMUM members who have, recently, given their time and energy in presenting stimulating and informative demonstrations, as well as assisting in other club functions.

Third, we need input as to what material will be in our second music sampler cassette. Interested artists should discuss this at the May meetings (on the 17th and 31st).

Adieu for now!

KCM (ASTMUM)

BRAG ST



Buffalo Region Atari Group for ST's

Minutes of the BRAG ST January 16, 1992 General Meeting

By Dane Stegman

The meeting was opened by Chairman Mark Pierro at 7:30 pm. Starting off with club business, Mark read the December 1991 Treasurer's Report from Gerry Genson. Next, Mark explained that this meeting was our annual "Meeting of Review", which allows us to review the club's progress and make changes in our Constitution and Bylaws. After a short discussion, no new changes were offered by the membership. It was then announced that the club's insurance was due and would be sent out this week.

Then Carl Barron gave an excellent demonstration of PAGESTREAM 2.1 by Softlogic. Next, Jeff Hontz demo'ed the game OBLITERATOR by Psychosis. Jeff did a great job showing the game off even though we forgot to bring a joystick! After a small break, we had our three door prize drawings as follows: 1) 3.5" Flip N-File Disk Box won by Charles Tuppon, 2) Color Printer Paper won by Harv Hontz and 3) Seven different colored 3.5" Disks won by Bruce Stringer. We then had our usual software raffle, won by Charles Tuppon, who went home with OBLITERATOR. The meeting then ended with an open forum.

CALCASIEU ATARI ST ENTHUSIASTS

LAKE CHARLES, LA

A NEW CLASS OF COMPUTER USERS

The goal of the Calcasieu Atari ST Enthusiasts is to increase awareness of Atari computers in Southwestern Louisiana. CASTE usually meets the last Saturday of each month. We meet at the College Park Nazarene Church, 340 East Prien Lake Road, in Lake Charles. Exact dates and times of meetings are announced in our newsletter and on our support BBS. Membership dues are $15 a year. This includes a subscription to Atari Interface, CASTE News, and access to the AIM disk of the month. For more information write to CASTE c/o Tim Bowles, 314 W. Claude St., Lake Charles, LA 70605.

Tim Bowles	President	(318) 477-3243
Glen Kelly	Librarian	(318) 478-3960
General Store BBS	1200-14400 baud	(318) 855-6939

Layton ACE of Utah

The Layton Atari Computer Enthusiasts (L.A.C.E.) membership cost $20 per year. Privileges include the AIM Monthly Magazine, access to the 8-Bit and ST club libraries, monthly meetings, monthly AIM public domain disks, free issue of AtariUser Magazine (available at club meetings), help and friendship. If you are presently not a LACE Club member and wish to join contact the one of following persons or write to LACE, c/o Marshall Walker, 1194 North 250 West, Layton, UT 84041 or call (801) 547-9902 or Irwin Brooks at (801) 731-1516.

Marshal Walker, President (801)545-7152
Lee Hatchell, Vice President (801)776-6687
Quhid Izatt, Secretary/Treasurer (801)544-4399
Richard Clark, 8-Bit Librarian (801)825-5823
Mark Seegmiller, ST Librarian (801)773-8555
Dave Young, Publicity Coordinator (801)776-6273
Irwin Brooks, Publications Coordinator (801)731-1516

The L.A.C.E. Club Meets in the basement of the Clearfield Library every second Wednesday of the month at 7:00 p.m.

Mark your calendars for the next meetings: April 1, May 13, 1992

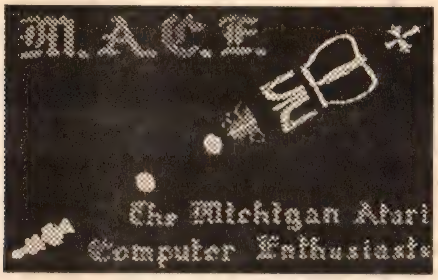
SEE -YOU- THERE!!!

Are You About To Expire? Renew Now!

L.C.A.C.E. P.O. Box 8788, Waukegan, IL 60079-8788

The Lake County Area Computer Enthusiasts (L.C.A.C.E.) was founded in 1983, and serves Northern Illinois and Southern Wisconsin Atari users. We are composed of 80+ members with several of our members belonging to dual groups (MilAtari, MAST, SCAT, RACC and TUG). Our meetings are held on the 2nd Saturday of each month at the Warren-Newport Public Library (excluding August picnic and Decembers Christmas party), 244 O'Plain Rd. Gurnee, Illinois (1 mile east of Great America).

L.C.A.C.E.'s dues are $20 per/year for family membership. Privileges include a subscription to our newsletter which is published 11 times a year, and access to our extensive public domain/shareware disk library for the Atari 8-bit, ST/Mega and Macintosh computers. Members with modem call access access the club areas of Python BBS 708-680-5105 or call our club HOTLINE 708-623-3815 for information and updates.



MACE Journal December 1991

Welcome to the December MACE meeting, tonights theme is the Atari Scavenger Hunt. If your here tonight you can see a lot of Atari hardware and software. Looking around I see all kinds of stuff, an awful lot of 8-bit equipment. I have to sit down now the president is about to speak-

Last Month's Meeting

Early on in the meeting the president reminded us of the December Scavenger Hunt/Present raffle and the participation 'certificates'. Then the subject of the Atari mall show came up. Commanding the table to my left were the owner of Team Computers Mike Drysdale and his associate. Larry from the SoftHouse Computer Center was also there for a little while. The discussion was about the Atari Fair at the Southland Mall in Taylor. The pros and cons of doing the fair were flying fast and furious, as on the one side Team Computers and SoftHouse Computers would not really be able to advertise at southland. There was mention of booths that one could lease for a small time. Also the time and manpower needed to man about 40 machines, at least 30 people will be needed to watch our computers at all times (Taylor is nortorious for theft). The fact that 40 computers (with monitors and drives) have to be available for 2 days was also mentioned. On the other hand there is the point that we won't get much return from it if anything. A couple of stores in Southland do carry Atari products, But Lynxes and game carts may not be worth the sacrifice in time and money and weeding out the crowds for a couple of stores to make a profit. There was mention of other computer stores (like Radio Shack) that might be willing to setup a table with there computers. But how would that profit us? We could probably sign up a couple of members to our club, but most people won't join a computer club without a computer. The Sponsers of this project have met Wedsneday, December 11. Only the MACE Forest will be able to keep up with this issue. You can voice your opinion or read the latest messages and get very up-to-date news on the MACE Trail.

Last month the topic was showing off the software that the club bought for the December raffle. It was by coinsidence that one of the raffle prizes was NeoDesk 3. I just happened to own a copy of NeoDesk 3, so I got to do a demo. Doing it was not as bad as I thought, because everyone broke up into groups and only occasionally would I get a straggler come up and ask about NeoDesk 3. But I will give a small review of it later in the MACE Journal.

I have several interesting subjects I want to write about. If you have a copy of last months Journal you'll notice a more professional look to it. Thanks to a club member (Kelley Miller) we have access to a very nice desktop publishing workstation and laser Printer. Hope to spruce up the Journal and I have a head start thanks to kelley. Meanwhile I was busy recreating our club logo. The old Mace was losing detail when we tried to digitize it for the Journal. Using Cyber Studio I created a new Mace in 3d. Hope to have it on an upcoming issue of AIM and on the MACE Trail for download.

The MACE Net

Last month I reported bullitin board numbers in the MACE Journal. Well we have another number to write about. The Bloom County BBS at 582-0888 and with baud rate 300/1200/2400.

Our own BBS the MACE Forest has been very active with replies to the general meetings, if you have any questions for the members of MACE please feel free to leave a message on this board. The MACE Trail is where you can leave a message for a member. A list of members should appear at the end of the Journal and the MACE Forest can be reached at 278-6466 with 300/2400 baud modems. In the near future I intend to write about going online in the MACE Forest.

Spies Like Us

We walked forward slowly, up the stairs, in the very big doors of the union headquarters, down the hall toward the doors named 1050. A bright glow emanated out of the small slit between the closed doors. I knew that inside those doors lay the answer to all of our questions. Kelley grabbed the door knob, turned it and opened the door. Inside the glow of 3 computers lit the room, so did the lights. The room itself was small considering the size of the group of people. Kelley and I sat down in the fourth row. Up front on a table, 3 computer systems sat. When the president of the club asked if there were any new members, Kelley yelled out "Mace spies, were all Mace spies!".

After all the commotion died down the WAUG members showed a hardware upgrade to an STE and the same kind for an 8-bit (800XL),(the Atari TT did not need it). The president then asked for a vote on going to Chicago and spending some money on the Atari fair. The vote passed and the president will go to Chicago. Then the members displayed some pictures on each of the 3 computers. The pictures were mainly comparisions between graphics of each system. One computer was the STE, the other was the 800XL and the third was a TT.

There was a little joking going on here, Sheep and goats seemed to top off the conversation now and again. The club members had to watch video screens at about shoulder level height. The screens could have been a little higher. They gave out door prizes, the winner got a mouse for the 16-bit prize and for the 8-bit a numeric keypad. All in all I had fun spying on them.

President ... Ted NewKumet
Vice President ... Ed Hanson
Recording Secretary ... Mark Tappen
Journal Editor ... Mike Casper
8-bit Librarian ... Ray Simmonds
16-bit Librarian ... David Haykus
Meeting Dates March 17 April 21 May 19 June 16

If you need any software or hardware, you might want to call these places up and ask them about it.

Team computers 22205 Kelly rd. East Detroit, MI. 48021 (313) 445-2983

SoftHouse Computer Center 32647 Ford rd. Garden City MI. (313) 422-6760

P3ACE

The Prez Sez by Steven Leser

Well, it's been another month, and the treasury has been rebounding nicely after we implemented the emergency cost saving measures. (It is approaching $300.) One of the things that I did was to send out applications, and newsletters to all in the local area who had once been members of the club. This resulted in quite a few 'new' members. There have also been a few more people from outside the country applying to be club members. (Korea, and several countries in Europe this time instead of North Africa).

Fred Koch, our new ST librarian outlined a master plan for providing the maximum amount of access to our vast library, to our users. 90 Megs of our best files will be on the BBS (LASER BBS 719-527-1374), when Fred gets finished, the library will include close to 200 Megs of public domain and shareware files. In addition, our users merely need to send him a self addressed, stamped envelope to him (with proper postage) and he will send on disk the files you request. He will also allow users to call him and he will have the files prepared on disk when he arrives. One merely has to pay for the price of a disk.

Roger Meston is planning a similar arrangement on the 8bit side of the house. Laser BBS will have 20-25 megs of the best 8bit files online. Considering that the average 8bit file is 40-100k, that is a simply huge amount of files.

I went to the 8bit meeting last month, and I was very impressed. The 8bit users seem to take a much bigger role in the overall flow of the meeting! Not only did they ask a lot of questions about the package Rick was showing off, they started modifying the thing to work with TurboBASIC instead of Atari BASIC! Rick should have a few more notes about that.

Take care, and we'll see you at the next SIG meeting!!!

ST SIG Notes by Terry Quinn

Steve Leser (Captain Picard) kicked off the January ST SIG meeting with an extensive demo of new club bulletin board, LASER BBS. Steve showed how to LOGON and other useful tips to make the board easier to use. Steve also showed everyone how to set up Quick Mail (aka Q-Mail). This is fascinating feature which gives users the ability to rapidly download messages and view them off line, in much the same way as Alladin does on GEnie. Steve also showed how to use F-Mail and "toured" the various FIDONET areas available on the board.

Fred Koch finished up the meeting with a demo of the P3ACE Disk of the Month (DOM). (We didn't received the current AIM DOM until the day after the meeting.) Fred also went through some of the features he's putting into the ST Library.

8-Bit Tid Bits by Rick Reaser

Not many showed up for the February 8-bit SIG, probably because there was a snow advisory for that night. We had a great time anyway. Members present discussed Jeff McWilliams efforts to start an 8-bit magazine and copies of his letter were passed out to all. We also looked at the latest catalogs from American Technavision and Toad Computers.

Rick demoed three programs he had recently received from American Educational Computers--Elementary Science Facts Grades 3&4; U.S. History Facts; and Vocabulary Word Builder. These programs weren't as good as the previous three, demonstrated at the January SIG, but they could be useful. At three bucks a pop, who's complaining? Rick also provided an encore demonstration of the "talking" educational program from Dorsett that uses the cassette recorder and a cartridge.

Next, the club took a tour of Steve Karasek's 1991 Tax Program. The program is in BASIC and tended to run slow in the opinion several in attendance, so we decided to see if it would run in TurboBASIC. Oops! Our TurboBASIC was on a MyDOS disk, so names of files could not start with a number. So we need to change a few file names. Ooops! (Our illustrious P3ACE President and ST master, Steve Leser popped in and actually knew what and error 165 was and helped us trace through INPUT statements in real time. Wow!) More file names start with digits than we thought. More mods. Ooops! The mall guard is getting ready to kick us out of the meeting room. Gotta go!!! It has now become my quest to get this program to run with TurboBASIC. I let you know WHEN I succeed.

We didn't have time to run copies of te AIM DOM, so Roger said he would post a Disk Commandered version on LASER BBS. Those without modems will need to wait until the next meeting.

I forgot to mention that at the January SIG, John Sandgren, donated a European program, "Fighter Pilot" to P3ACE. It comes complete with the patented "LENSLOK" security system, which everyone got a kick out of at the January meeting. Rick Reaser's dad also donated "The Seven Cities of Gold" and "Pinball Construction Set" for the club to sell. These three programs (along with several other titles) are for sale, cheap, to help reinforce the club treasury.

On another note, your acting 8-bit VP, me, accepted the post a 8-bit editor for Current Notes magazine. This should be a big benefit for the club, as we will now have access to all the latest and greatest 8-bit news and stuff. Already, several people have volunteered to become feature authors. Now we will have authors for two national Atari magazines. As a part of this new job, I got a CompuServe account. Now Hugh DeLong will have a fellow P3ACEr to send E-mail to. My account is 72130,2073.

Editor E-mail by Sam Cherry

Diskettes will now be for sale by the disk librarians. See Fred Koch, if you need 3 1/2 inchers and Roger Meston if you need 5 1/4 inchers.

Check your mailing label to see if your dues are getting ripe. Lots of people's memberships are up in January. Sam Cherry is temporarily dropping off GEnie, so someone else will be filling in for him for the next couple months.

Be sure to check out LASER BBS!!! The FIDONET mail is really neat, especially for you 8-bitters. If you don't have a modem, buy one or borrow one of the club modems. You are really missing out if you aren't a telecommunicator. The new, big, Hard Drive will be here in March, hopefully, and there will be even more options available. DIAL (719) 527-1374 NOW!!

R.A.C.E.

Pres. Lewis Midyette 828-4319
Vice Pres. Eric Schofield 851-5134
Secretary Don Nelson 942-2764
St Librarian Tony Manino 851-8092
8-bit Librarian Arthur Katz 881-0247
Treasurer Robert Yates 552-7053
Galaxy BBS 552-0974

Well, gang. Another month has come and gone, spring time is quickly coming upon us. We have been showing some very interesting things in our meetings. Last meeting we showed how to Lzh, arc, Un'lzh, Un'arc. We also showed how to un'zip, and un'zoo. This seemed to be an area of some confusion. We also had open for discussion any questions about NeoDesk 3.0.

Our attendance has been very good and we are still getting about 1 to 2 new members a month. We would like to increase this so the club will thrive. So tell all of your ST or 8-bit friends to call the board or bring them to the meetings. We have recently had several 8-bit people interested in the group. We are glad to see the enthusiasm. To join the club all you need is $20 and you will receive full access to the Club BBS, subscription to AIM, access to the club Library. For times and dates of the next club meetings Call Lewis Midyette at (919)-828-4319.Or the club BBS at (919) 552-0974.

SALSA
ST Atari League of San Antonio

SALSA The ST Atari League of San Antonio, P.O. Box 18731, San Antonio, TX 78218-0731

SALSA is the user group that serves the ST/STe, STacy, and TT users of San Antonio. We also support the Lynx handheld game machine. Meetings are held on the second Tuesday of the month at the Balconies Hieghts Community Center, 107 Glenarm, right off of Fredricksburg road, from 7pm to 10pm. A SIG/Videogame night is sponsored by SALSA on the third Tuesday of the month at the same locale. Membership is $20.00 with AIM and $15 without Aim but with the clubs Newsletter. Subcribing membership is available for those unable to attend the meetings which includes Newsletter and discounts at local businesses that support SALSA. A Disk of the Month filled with the latest software is available at each meeting for $2.00 along with copies from our extensive PD library and AIM disks.

Officers:
Tim Hebel, President (512) 656-5315
Patrick Burch, Vice President (512) 655-8970
John Burner, Secretary/Treasurer (512) 655-2542
Kyle Miller, Software Librarian (512) 945-9469
Russell Gibson, Hardware Librarian
Thelma Sunvison, Public Relations

Salutations from SALSA. The Atari world is going well inspite of economic setbacks. Membership is up to almost 100 members and turn out to the meetings have been impressive. San Antonio now has four BBS that not only support the ST but are ran on STs as well.

Booji boy (512) 657-9254 SALSA support board ran by our own President Tim Hebel. Booji (Pronounced boogie) is the only ST music support board in the Alamo City.

Eagle's Nest (512) 656-3261

Excalibur (512) 523-0045 One of SA most popular BBS with a large message base including several nation wide F-nets.

Hacker's haven (512) 653-2911 Newest board in town. Features Znet news online.

I would like to pursuade my fellow STers to help support the local businesses that support the Atari computer.

StarBase Atari, 1015 W Hildebrand, San Antonio 736-1405

International Computer Distributers (Atari Connection), 3010 Beacon Fld, San Antonio 675-3072

All Systems Go, 7271 Wurzbach, San Antonio 614-3768

Floyd Blunt's Atariville has officially changed hands to Marce and Cheryl Clark. The new owners of Floyds Atari-ville have decided on a new name for the store, Starbase Atari, although it will be awhile before any real name changing happens. Marce and Cheryl Clark are very enthusiastic ST supporters, and the place is really shaping up under their guidance. They plan to increase hardware inventory, add lynx cartridges and a larger variety of software to the store.

Rumors are circulating that All Systems Go will discontinue selling ST software in the near future but these rumors have not been substantiated. ASG also carries Lynx cartridges, IBM, Amiga software and movies. ASG has fallen under fire recently by national computer magazines for their store policies, but the owners have so far faced no ill effects and business has in fact increased.

If you have any additional info about places that sell ST stuff, please leave a message to one of the officers on Booji Boy or Excalibur BBS or drop a note to us at PO Box 18731, San Antonio, TX 78218-0731.

Patrick M. Burch Vice President

San Diego
Atari
Computer
Enthusiasts

General Meetings are the 3rd Monday of each month at the North Park Recreation Center Social Room, 4044 Idaho Street at 7pm. ST/8-bit workshop meetings are on the 1st Thursday of each month at the North Park Adult Center, 2719 Howard Street at 7 pm. All meetings are open to the public. Annual SDACE subscription dues are $18 which includes increased BBS access, AIM subscription, SDACE newsletter subscription, and reduced rates on the Disk of the Month. SDACE's address is PO Box 900076, San Diego, Ca 92190.

President Dan Phillips (619) 462-1289
Vice President Dean Smith (619) 582-6749
BBS - 24hrs, 300-2400 baud, 80 MB (619)689-8157

WAUG

WAUG General meeting minutes of 2-11-92

The meeting was opened at 7:30 PM by VP Craig Harvey presiding in the absence of our President. Craig announced the availability of the new Supra V32/V42 9600 baud modem for a group purchase. Anyone interested should be prepared to ante up by the March meeting. His next announcement was the availability of tickets for the upcoming TAF Atari show in Toronto on April 4th and 5th. All interested parties should contact Craig.

Ralph Salmeron fired up a demo of Draw 7 XE from the January AIM disk. Contrary to the AIM listing, Ralph says that XE Basic is not required to run this program but 128K is needed. He showed us how Draw 7 could switch modes from graphics to magnified graphics for pixel editing to text mode for placing text. Draw 7 XE had enough features to keep Ralph happy but he did mention the lack of support for touch tablets and the inability to mix palettes. It does however have the ability to load many different popular file formats. Due to some hardware difficulties a full demonstration of the program's capabilities was not possible. The documentation for this program is on the AIM disk.

Bill Rayl brought the ST/TT program Chronos 3D for a demonstration of it's features. He explained to us that Chronos creates not the objects but rather animations with already created objects. Bill said that if you need to make the objects you may use Cad 3D or Lexicor's just released Rosetta. Chronos is a key frame animator, that is it lets you specify the first and last positions of the object and it does all the stuff in between. A quick six frame demo of a ball moving across the screen graphically illustrated just how this works. The first position and last position of the ball were all the Chronos needed to make it go across the screen. The morphing capabilities of Chronos were demonstrated effectively as Bill showed us a chess queen changing into a king on the screen before our very eyes. The only thing Chronos need to do this was a graphic of the queen and a graphic of the king. Once again, it did all the changes in between. The cycling feature of Chronos lets you move objects with different parts in unison. Bill showed this off with his own sunrise scenario where a sun rose over a mountain range changing the light and shadows as it went. Another great looking demo was a face literally rising out of a floor ala Terminator 2 done by the author of Chronos. Another demo of great interest was a conversion from an IBM animation file. A quick mention was made of Prism Paint which is Lexicor's paint program for use with the objects for Chronos. Bill's enthusiasm for Chronos was obvious since he had nothing but praise for it especially the documentation and included tutorial.

Members then asked questions about the length of animations that were possible with Chronos (depends on memory available), a particular background in one of the demos (done with Autodesk on an IBM and converted with Rosetta) and future enhancements (automatic shading-automatic tracking of an object by the lighting).

Mike Olin then presented the new WAUG library disks including two full game disks and a disk of utilities. Ralph presented us with an 8 bit library disk full of all kinds of different programs for the Atari Classic.

Our special guest Mike Drysdale of Team Computers took the floor to talk about some of the exciting new things available for the ST/STE/TT computers. A new 1.44M floppy drive and controller chip along with TOS 2.06 elicited questions from the members about upgrades, etc. Someone raised a question about the new GE Soft ram upgrade board for the TT that promises to make ram upgrades affordable. Mike said that it works well as far as he is aware. Members wanted to know about the new monitors that Atari has been making available. A new flat screen monochrome with a 14" screen is being released to replace the SM124 according to Mike. After Mike's fielding more Atari questions from the members the meeting was adjourned at 9:45 PM.

Respectfully submitted,
Dan Cable Secretary

W.M.A.U.G.

From The President's Desk

Many people these days are worrying about Atari. Where their place is in the grand theme of things relative to computing. In these days where even the mighty IBM and MAC are feeling the crunch of slow computer sales and the sluggish economy it's hard to tell.

When I hear people running down Atari for not keeping place in thek growing computer market place I too have to look at our aging machines. But when I look at my Atari I don't see a decrepid beast just yet, but I see a machine, that even in the face of a revolution of computer technology, and even in the fact that it has changed little from its original incarnation, has still managed to be better in many aspects to its MS-DOS brotheren.

I ask for you to look at how long it took the IBM world and Microsoft to discover a Graphic environment. And even in the face of Windows how long it takes that program and many IBM's to perform a task done ever so simply on an Atari for all these years.

When you look at your machine and try to stem of the fear of obsolescence ask yourself this, "Does it do what I need" ?

In the case of my Atari it does. Thru excellent Telecommunication programs like STALKER and VANTERM I can keep up with the rapidly growing wealth of information on the local and long distance BBS's.

With Excellent DTP applications like Calmus and Pagestream I can do on my 8 MHZ Atari what others spend thousands to do on their platforms.

And yes there still are numerous Games I still play with alot more on their way soon including a WING COMMANDER like game called "EPIC".

Indeed my ST is far too active to see the Dust of my closet shelf yet. Ask the owners of a 286 clone if the same will hold true of their machines when they are seven years old !

See you next month.

Don't buy another hard disk!

1K 10K 100K 1M 10M

TAX Wizard

A GEM oriented tax preparation program. Use TAX Wizard, and your tax preparation session will be short and sweet. Values from each form are stored for call-up by other forms needing the information. All data is saved each time you close a form. Additional screen prompts help the user answer tax pertinent questions to help figure out the largest deductions and smallest possible tax obligation.

- Fully interactive.
- Transfer data between forms.
- Automatic form calculations
- Uses tax tables to compare lowest tax rates.
- All supporting tax forms can be submitted to IRS as printed.
- Print in place on 1040 form for submission to IRS.
- IRS copies of all supported forms included in TAX Wizard package.

Complete Package $49.95

Forms Covered:
Form 1040
Schedule A
Schedule B
Schedule C
Schedule D
Schedule E
Schedule EIC
Schedule F
Schedule R
Schedule SE
Fomr 2441
Form 3903
Form 4868
Form 8606
Form 8829
Form 2106
Form 4562
Form 1040A
Schedule 1
Schedule 2

Future forms include 941, W2, 1099, etc.

Upgrade Notice: *Registered TAX Wizard owners deduct $10 when ordering the 1991 tax year package. Unregistered owners send old registration card with order.*

Two Monitors in One?

I love Atari Color and Monochrome monitors. But wouldn't it be nice if ONE monitor did both? You can and we have the solution! For only $499 you can purchase our Star★Sync Monitor System. The system comes complete with everything you need to make your ST run in Color or Monochrome with the flip of a switch! No hassle. No mess. One Switch! Better yet, you can TradeUp your existing monitor for cash!

Douglas Hodson, Owner

WE HAVE OVER 2000 SOFTWARE TITLES IN STOCK!

Atari Computers!

Atari STE 512K	$349
Atari STE 1MB	$399
Atari STE 2MB	$499
Atari STE 4MB	$599
Atari Mega STE's	$689

Monitors

Atari SC1435 (Color)	$359
Atari SM147 (Mono)	$199
Magnavox Stereo Color	$289
Star*Sync System	$499
(Sharp Color and Monochrome)

Programming in Michtron Command Language
A Tutorial for Michtron BBS 3.0 SysOps

Jeff Wells

Welcome back. In our first article, we talked about some of the basics of programming in MCL. We talked about how all variables and string variables have a global effect. We discussed Labels and Subroutines, Loops and how to exit from Loops.

In this article, I originally planned to go into detail on the 32 unique System Variables and the 78 System Functions and Procedures and give definitions to the above and examples. But, since they are defined in the MBBS v3.0 manual, I've decided to get right into the programming instead.

Let's say you have an idea for a *new* program you want to write for your BBS. What you need to do first is to flowchart what the program is going to do. This task will only be as difficult, and as detailed, as you make it.

I am going to show examples of a Baseball game I wrote in MCL for my BBS. My flowchart was very simple and I used it for my plan of attack when coding this program:

Start of Program
Store Bbs Variables, Then Zero Out All Variables
List Credits
Display/Create Baseball Menu
If New Player, Create Files
Load Players' Files
Display Games Played Since Last Played
Display Both Team's Stats
Select Pitchers
Assign Variables
Start Playing Loop

Starting the Program

If you plan on allowing other sysops to have your program, you need to at least create a Variable list so that others have an idea of what you are doing. Here is the Variable list for MCL Baseball.

```
/* ------------------------------------
         MCL Baseball version 1.0
          Program by Jeff Wells
              Lone STar BBS
   (817) 690-1993        (817) 690-5874
   ------------------------------------
System Variables               System Strings
================               ==============
a                              a$  Coach
b  Home Score                  b$  Team Name
c  Visitors Score              c$  Batter #1
d  Type of Pitch               d$         #2
e  Type of Bat                 e$         #3
f  Balls                       f$         #4
g  Outs                        g$         #5
h  Strikes                     h$         #6
i                              i$         #7
j  Hits for Home Team          j$         #8
k  Who is Fielding             k$         #9
     (0=home,1=visitors)
l  Hits for Visiting Team      l$
m                              m$
n                              n$
o                              o$  Home Team File Name
p                              p$  Base Query in Bit Format
q  Score by Inning, Home       q$
r  Score by Inning, Visitors   r$  Base HIT Query in Bit Format
s                              s$
t                              t$
u  Inning                      u$
v  Home Team Batter Number     v$
w  Visitors Batter Number      w$
x                              x$  Visiting Team File Name
y                              y$  Home Score Line
z                              z$  Visitors Score Line
*/
```

Now, we have a foundation from which to work. We have a plan of attack—our flowchart—and we have our Integer and String Variables mapped out.

Storing/Zeroing Variables

Let's look at some code and discuss what it's doing.

```
Baseball:;
log("Entered MCL Baseball...");
print("\f\nPlease Wait While I Save BBS Vari-
ables...");
x$ = "\\bbs\\baseball\\game";
str(y$,modem);
strcat(x$,y$);
strcat(x$,".bbl");
if(exist(x$))
      delete(x$);
p$=x$;/* you can change p$ to whatever you want */
str(d$,user_var0);
logfile(p$,d$);
str(d$,user_var1);
logfile(p$,d$);
str(d$,user_var2);
logfile(p$,d$);
str(d$,user_var3);
logfile(p$,d$);
str(d$,user_var4);
logfile(p$,d$);
str(d$,user_var5);
logfile(p$,d$);
str(d$,user_var6);
logfile(p$,d$);
print("Done!!\n");
a=0;b=0;c=0;d=0;e=0;f=0;g=0;h=0;i=0;j=0;k=0;
l=0;m=0;n=0;o=0;p=0;q=0;r=0;s=0;t=0;u=0;v=0;
w=0;x=0;y=0;z=0;
a$="";b$="";c$="";d$="";e$="";f$="";g$="";h$="";
i$="";j$="";k$="";l$="";m$="";n$="";o$="";p$="";
q$="";r$="";s$="";t$="";u$="";v$="";w$="";x$="";
y$="";z$="";
user_var0=0;user_var1=0;user_var2=0;user_var3=0;
user_var4=0;user_var5=0;user_var6=0;
print("DONE!!\f");
```

The first thing we do is to assign our beginning point. We create, in line 1, a Label called *Baseball:;*. Note the :; trailing our label, this is how MBBS knows it's either a label or subroutine.

In line 2, we create an entry in the BBS log showing us that the user entered the program. I highly recommend doing this for two reasons. First, you can see who is accessing your game and how popular your game is on the BBS.

The other, and probably most important reason, is that if you also make an entry when the user has properly exited the program, you can see if they exited the program by hanging up (dropping carrier) on the system.

We then create a file called "game?.bbl" in the \bbs\baseball\ folder, where the ? is replaced by the modem number on which the user is connected. Since I run a multiline BBS, I tag the 'game' file with the modem number of the user playing, 0 = console and 1-3 representing the modem the user is using. This is needed so one user does not receive another user's user_var settings when they finish the game.

In line 8, we check to see if the game file already exists. If it does, that means a previous user called in on the same modem and played this game. Since we don't need that file anymore—in fact, we want to replace it for the current user—we delete the file in line 9.

In our new game file, we store the values contained in *user_var0* to *user_var6*. I use these individual "user variables," which are built into Michtron's BBS, to do different functions for the user.

Once the user variable values are saved, we wipe the slate clean, zeroing out all variables and string variables. We also zero out the user_vars.

You will notice the above code uses a procedure called **log(sexp)** and one called **logfile(sexp1,sexp2).** The log() procedure writes the supplied string to the BBS log file (ACTIVITY.BBS). The logfile() procedure is similar, except that it allows you to output a supplied string (sexp2) to a file of your own choosing (supplied in sexp1).

The other important procedures used in this code segment are **str(sexp,var)** and **strcat(sexp1,sexp2).** As you can probably guess, str() converts an integer to a string and stores it in the string variable designated by sexp.

The strcat() procedure *concatenates* the sexp2 string onto the end of the string contained in sexp1. For instance, let's say *a$* contained the string "ABC" and *b$* contained "DEF". After a strcat(a$,b$), *a$* would contain "ABCDEF". If, instead, we had done a strcat(b$,a$), variable *b$* would contain "DEFABC".

Displaying Credits

Let's look at how we display our credits and create and display the Baseball Main Menu.

```
if(exist("\\bbs\\baseball\\baseball.lst"))
      list("\\bbs\\baseball\\baseball.lst");
      /* My Credits */
pause("\n\n\t\t\t  Hit any key to continue");
```

We use the exist(sexp) function to see if the credits file is present. If it is, we display it using the **list(sexp)** function. Notice how the list(sexp) is indented. The reason I do this (and recommend it) is simple—that command will only execute if the exist(sexp) function returns a value of TRUE. You will notice I indent all my code that falls within conditional statements. This is common practice and makes your code much easier to read.

What's on the Menu?

Now, it's time (according to our "flow chart") to start working on our main menu. Here's some code:

```
z$ = "\\bbs\\baseball\\teams.bbl";
MAIN:;
a$ = "12";
print("\fMCL Baseball Main Menu");
print("\n=====================");
print("\n[1] Instructions");
print("\n[2] List MCL Baseball Standings");
```

Here, we assign z$ to the path and filename that stores all the players names. Then, we create a label called MAIN:;. This is necessary when you create a menu, so you have a beginning point to return to after the user selects one of the choices in the menu.

String variable *a$* is going to be used to test the keystrokes allowed in response to the menu. We set it to "12" for now, and we will add more command validations to it as the menu gets created.

The first line of the actual menu (the first print() statement) clears the screen (\f) and displays the name of the menu. Selections *[1]* and *[2]* are always going to be able to be displayed, so we insert those also. That is why we have the "12" in *a$* that we assigned earlier.

```
if(exist("\\bbs\\baseball\\nohit"))
{
        print("\n[3] NO HIT Club");
        strcat(a$,"3");
}
if(exist("\\bbs\\baseball\\club400"))
{
        print("\n[4] 400 Club");
        strcat(a$,"4");
}
if(exist("\\bbs\\baseball\\club500"))
{
        print("\n[5] 500 Club");
        strcat(a$,"5");
}
if(exist("\\bbs\\baseball\\club600"))
{
        print("\n[6] 600 Club");
        strcat(a$,"6");
}
if(exist("\\bbs\\baseball\\club700"))
{
        print("\n[7] 700 Club");
        strcat(a$,"7");
}
if(exist("\\bbs\\baseball\\topbat"))
{
        print("\n[8] Top Batter in MCL Baseball");
        strcat(a$,"8");
}
if(exist("\\bbs\\baseball\\worstbat"))
{
        print("\n[9] Worst Batter in MCL Baseball");
        strcat(a$,"9");
}
```

What we did in the above code was to see if a file existed, and if it did, we printed the selection to the screen, which added a new line to our menu. Then, we used the strcat() procedure to add the command's initiating keystroke to our variable *a$*.

```
print("\n[0] PLAY BALL");
print("\n\n[G] BAMF! (Goodbye)");
if(level == 4)
{
        print("\n[R] Reset the game, individual");
        strcat(a$,"R");
}
print("\n[Q] Quit to Main Menu");
print("\n\nEnter your selection. [0] ");
strcat(a$,"0GQ\r");
k = key_match(a$);
```

We finally add the menu item that lets us play the game—good idea I thought—as well as a way to log off the BBS from the game.

Then we use one of the unique System Variables, **level.** This variable contains the access level you have assigned to the user. If the person accessing the game is a *Wizop* (their level equals 4), then we add another command—Reset the game, individual. I added this so sysops have the ability to zero out *all* or just one of the users' stats within the game.

We then add a command to exit back to the BBS—the DOORS menu in this case. A prompt to enter a selection is displayed, with the default enclosed in brackets. We then used strcat() again to add commands "G", "Q", and "\r" to *a$*. The "\r" is the same as a carriage return. You'll see how we use this later to be the equivalent of typing "0" as the command.

We did not opt to use the **input(prompt,svar,len)** function here, as we only want to accept certain commands that we have built into *a$*. Instead, we use the **key_match(sexp)** function to accept a keystroke from the user. This function only accepts the characters contained in the string variable passed to it—in our case, *a$*. All other keypresses are ignored.

Once a valid keypress is entered, its ASCII value gets stored in the integer variable *k*.

Stats and More

This completes the building our menu. Now, let's look at how we pass control to different areas using the main menu commands.

```
if(k == '1')
{
        print("Instructions");
        list("\\bbs\\baseball\\baseball.ins");
        pause("\n\nHit any key to continue.");
        goto Main;
}
```

As mentioned above, the variable *k* holds the ASCII value of the keystroke entered by the user. When you enclose a character with single quotes (' '), MCL uses the ASCII value of the character. In the above if() statement, we could have used *if(k == 49)* and we would get the same result. Most people find it much easier to use characters rather than their ASCII codes, though.

Also, note the double equals signs (==). If we use a single equals sign, MCL will assign a value to the variable or string variable. The == is used for comparison only and does not change the value of the variable. It is very important that you remember this distinction.

For instance, if the condition *if(k = '1')* is used, it will *always* test TRUE, because you are setting *k* equal to 1 before testing. This is not the same as *if(k == '1')*, which checks to see if the value of *k* is equal to 1.

In the above code fragment, if the user pressed the number 1, we display "Instructions" on the same line as the prompt. We then display BASEBALL.INS and use the **pause(sexp)** function. This function displays the passed string and waits until the user presses *any* key. Once the user presses a key, we jump back to the label *MAIN*.

One other thing to note—conditional statements (*if, while,* etc.) are not trailed by a semi-colon (;), while procedures and functions must have a trailing semi-colon.

```
if(k == '2')
{
      print("List MCL Baseball Standings");
      print("\fName of Team           Coached by
Win Los   Pct Run Inn  ERA");
print("\n=========================================
=============================\n");
      list("\\bbs\\baseball\\standings.bbl");
      pause("\n\nHit any key to continue.");
      goto main;
}
if(k == '3')
{
      print("NO HIT Club\n\n");
      print("\fName of Player           Name of Team
At Bat Hit   PCT");
print("\n=============================================
=================\n");
      list("\\bbs\\baseball\\nohit");
      pause("\n\nHit any key to continue.");
      goto main;
}
if(k == '4')
{
      print("400 Club\n\n");
      print("\fName of Player           Name of Team
At Bat Hit   PCT");
print("\n=============================================
=================\n");
      list("\\bbs\\baseball\\club400");
      pause("\n\nHit any key to continue.");
      goto main;
}
if(k == '5')
{
      print("500 Club\n\n");
      print("\fName of Player           Name of Team
At Bat Hit   PCT");
print("\n=============================================
=================\n");
      list("\\bbs\\baseball\\club500");
      pause("\n\nHit any key to continue.");
      goto main;
}
if(k == '6')
{
      print("The 600 Club");
      print("\fName of Player           Name of Team
At Bat Hit   PCT");
print("\n=============================================
=================\n");
      list("\\bbs\\baseball\\club600");
      pause("\n\nHit any key to continue.");
      goto main;
}
if(k == '7')
{
      print("The 700 Club");
      print("\fName of Player           Name of Team
At Bat Hit   PCT");
print("\n=============================================
=================\n");
      list("\\bbs\\baseball\\club700");
      pause("\n\nHit any key to continue.");
      goto main;
}
if(k == '8')
{
      print("Top Batter in MCL Baseball");
      print("\fName of Player           Name of Team
At Bat Hit   PCT");
print("\n=============================================
=================\n");
      list("\\bbs\\baseball\\topbat");
      pause("\n\nHit any key to continue.");
      goto main;
}
if(k == '9')
{
      print("Worst Batter in MCL Baseball");
      print("\fName of Player           Name of
Team       At Bat Hit   PCT");
print("\n=============================================
=================\n");
      list("\\bbs\\baseball\\worstbat");
      pause("\n\nHit any key to continue.");
      goto main;
}
if(k == 'R')
{
      gosub maint;
      goto main;
}
```

If you have only one command to execute after an *if* statement, MCL does not require you to enclose it in curly braces ({ }). In the examples above, we executed several commands per *if* statement, so these commands must be enclosed so MBBS knows where to start and end for that condition.

Most of the code used here is now "old hat." The only new command we issued is the **gosub** command. This command transfers control to a subroutine (which we'll define later). Once the subroutine is executed, control is returned to the line directly under the gosub call.

The basic difference between gosub and **goto** is that MCL automatically returns to the line following the gosub once the subroutine is finished; goto, on the other hand, is used to jump to a label with no direct way of returning to the jumping off point.

```
if(k == 'Q')
{
      print("Quit to Doors Menu");
      execute("DOORS");
}
if(k == 'G')
{
      print("BAMF! (Goodbye)");
      execute("BYE");
}
```

We use the **execute(sexp)** procedure here. This procedure is used to run other compiled MCL files, transferring control to the executed file. With the execute function, you can only pass the filename with *no* pathname and *no* extender. MBBS assumes the program is in the system drive's BBS folder and will add the .MCL extender. If the file does not exist in the BBS folder, a fatal error occurs and MAIN.MCL is loaded.

Once you use the execute command, there is no way to get back to the calling program, unless you use execute again. You can not use the **return** command to take you back to the calling program, as you can in subroutines defined within the calling program.

(Beware of creating one program to call another that, in turn, calls the original program. Unless you're careful, you could get into an "infinite loop" where you continuously jump back and forth between the two programs!)

That's it for this month's installment. See you next time!

The only **Professional** font editor for the Atari.

Create unique typefaces, logos & graphics with the ultimate in typeface design software for the Atari ST. (Convert fonts to PageStream and Calamus using FontVerter).

Create Type 3 fonts for use with all Postscript devices, including Ultrascript, and other software postscript interpreters. "PLUS" version also creates TYPE 1 fonts for use with PageStream v2.1 and true Adobe Postscript printers and imagesetters. Type 1 fonts are also compatible with "COREL DRAW" and "Adobe Type Manager" on PC compatibles.

Bit MT Maker

Create Bit Map fonts for **GDOS** *(Printer and Screen!!) and Create screen fonts for* **PageStream** *(including 2.1) automatically from .DMF or .PFB printer fonts.*

Type 1 Converter

Convert industry standard TYPE 1 fonts into Font Designer format for use with the ATARI ST! Fonts converted with Type 1 Converter can be converted to either Calamus or PageStream using **FontVerTer**

(Type 1 Converter is included in the Font Designer PLUS package)

Never say ***"I wish I could use that font"*** again!! Convert fonts between Pagestream, Calamus and Font Designer with a few clicks of your mouse.

Menu Plus

H. Earl Hill
SAGE

Menu Plus is a "desktop enhancement" from Rimik Enterprises that allows running programs from floppy or hard disk drives via a menuing system, thus saving the time it would take to open windows and folders. It uses a "Menu Tree" type system that allows you to set up programs by category (Main Menu) and sub-categories (Sub-Menus). It gives access to over 160 programs plus file selector access.

Menu Plus uses only 32K of memory when running a program with no slow down of the program. From the 13 Main Menu selections, up to 13 Sub-Menu program selections can be entered. Programs can also be run directly from the file selector. The package can be used on systems with as little as 512K of memory.

A number of other features have been built into Menu Plus, hence the "Plus" in the name. You can view Degas, Neochrome and Spectrum 512 pictures. You can play and edit ST-Replay sound files. A special "AUTO PLAY" feature lets you play all the sound (.SND format) files in a specified directory. Text files may also be viewed and printed. The BLiTTER chip, system colors and the system time and date can be set. A password feature is also incorporated, along with a memory check.

The Menu Mate desk accessory is also included. This allows users to have the sound player/editor, text viewer/printer and picture viewer features available while running other programs.

Getting Started

The Menu Plus disk (unprotected) contains the folder Menu Plus (containing MENUSHEL.PRG, BASECODE.EXE, MENUMATE.ACC, MENUMATE.RSC, MENUPLUS.MNU, MEMORY.PRG) and the folder HARDDRIV with STARTGEM.INF.

The manual contains instructions on installing Menu Plus and Menu Mate on a floppy disk drive or a hard disk, plus information on the correct movement and allocation of the files. Instructions are also given for AUTO booting Menu Plus (with or without STARTGEM) on various versions of TOS.

To start Menu Plus, you can run MENUSHEL.PRG. When Menu Plus or Menu Mate are run, they ask for the allocation of memory -- 150K on a color system or 40K on a monochrome system. This query greets you before the Main Screen is displayed.

Working with Menu Plus

When you first run Menu Plus after the selection of the memory allocation, you see the Main Screen. The functions are mouse selectable only. For the purpose of this review, let's first consider the program running functions available from the Main Screen.

The Main Menu has two entry windows for filenames. The left window columns are for setting up the main program categories (such as Utilities, Applications, Graphics, etc.). There are 13 menu selections and each has 13 sub-menu selections attached to it. The mouse cursor is used to activate the desired entry window.

The sub-menu contains program names and program path information from which the programs are actually run (or launched). The blanks are filled-in, so to speak, by use of the button functions (for Entry or Editing) of "ADD TO" Main Menu or Sub-Menu. File entry, as well as selecting path information for a particular cell, is relatively straightforward. Filenames and paths are saved to disk.

On the Move

The MOVE function allows you to move a menu cell anywhere within a menu window. To move a menu cell, you click on "MOVE" and the mouse cursor turns into a hand. Then, you click and continue to hold down the mouse button over the menu cell you would like to move. While still holding down the mouse button, you move the menu cell over any one of the menu cells within the window. Once you have positioned the menu cell where you would like to place it, you stop pressing on the mouse button. Menu Plus automatically shuffles the menu cells to accommodate the change.

L/C/R

The L/C/R function lets you justify the contents of a menu cell either Left, Center or Right.

Load, Save and Delete

LOAD MENU loads a Menu Plus menu information file from disk. Each menu file can hold 169 different programs and their path information, system colors and your password. If you loan a menu file that was saved in monochrome, the default colors for your system will be displayed. The default menu information filename is "MENUPLUS.MNU".

SAVE MENU lets you save your present menu information to a file. This includes main menu names, sub-menu names and path information, system colors and your password and password status (active or inactive). DELETE MENU lets you delete either main menu or sub-menu cells. You can also delete whole sub-menu or main menu categories.

Launch or Run?

The LAUNCH SELECTION function allows you to launch (run) a program that's already included in a sub-menu. To use this function, you first select the main menu and the corresponding sub-menu cell. Next, you click on "Launch Selec." (or click the right mouse button) and the program will be run.

RUN PROGRAM allows you to run a program just by selecting it through the file selector. This is helpful for programs you do not want to add to a sub-menu and would just like to run once. To use this function, you simply click on "Run Program." A file selector appears and you choose the file you would like to run.

Clicking on the "File Selector" button at any time will bring up the file selector. This is most useful for owners of UIS III or other replacement file selectors. Clicking on "OK" or "CANCEL" exits this function.

The Menu Bar

A special function selection on the Main Menu screen is the Menu Bar. The Menu Bar allows access to other Menu Plus functions not available from the Main Screen area. It also allows access to accessories that are in memory. The Main Menu is shaded while you are using the Menu Bar.

The Atari symbol menu heading provides access to any accessories in memory as well as an exit to the Main Screen area.

The System menu allows you to set the following system functions:

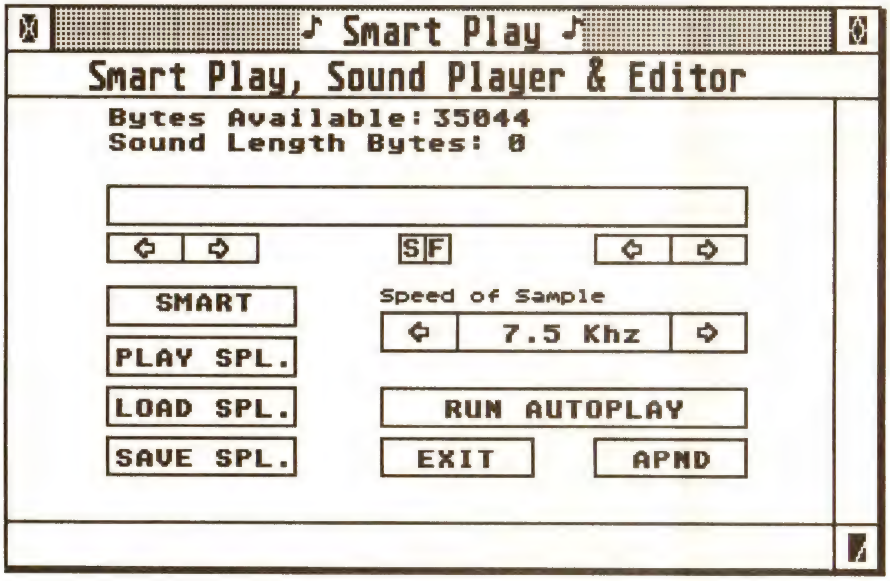
SET COLOR: This menu selections lets you set your computer's color palette. Once you select "Set Color," a dialog box appears. Using the slider boxes, you are able to select a color. The color controls range from 0 to 15 (on an STE or MegaSTE) or 0 to 7 (on an ST or Mega) for Red, Blue and Green. SET BLITTER: This function allows you to turn the BLiTTER chip on and off. If you do not have a BLiTTER chip in your computer, this function will not affect your computer's performance.

SET TIME AND DATE: This function sets the system time and date.

MEMORY: Clicking on EST. MEMORY shows an estimate of how much free memory is available to run a program. Clicking on FREE MEMORY shows the current memory available in your computer.

The Print/Show menu lets you access the various viewers/editors available within Menu Plus. From here, you can print or view text files; show Degas, NeoChrome or Spectrum 512 pictures; and edit and play ST-Replay sound files. (Note: Only Degas monochrome pictures can be viewed in monochrome mode.)

Under the Misc/Menu heading, you can access options to print out all of your menu information and set your password and password status. If you set a password and select "ACTIVE," the Menu Plus security system is armed. This function locks out anyone from using your system unless they have your password. (Make sure to write down your password in a safe place, just in case you forget it.)



Smart Play, Sound Player & Editor

Bytes Available: 35044
Sound Length Bytes: 0

Speed of Sample: 7.5 Khz

If you would like to deactivate the security system, select "INACTIVE" and click on "OK." Be sure to use the "SAVE MENU" function so that your password status is updated.

Using Smart Play

Many computer owners are now discovering digitized sound samples available on BBSes across the United States. You probably own one or two games that use some type of digitized sound. Some animation packages now have the ability to incorporate sound samples in their sequence of files. This makes for some great effects. The applications are limitless.

Smart Play has basically two different functions: editing and playing of sound sample files. With Smart Play, you can edit and save any sound file you load into memory.

There are two ways to play sound samples with Smart Play. The first is to simply load the sound sample, set the play speed and select play. The second way is to load a sound sample into memory and append the first byte in the sample to contain the play speed of the sample. By using the latter method, you can play sounds one after another using yet another feature called "AutoPlay."

In order to have sound samples load and play in the correct speed or "Khz," you must append the current sample in memory. You select the proper speed setting (you are really setting the proper frequency, but speed is easier to relate to). Then you select the "APND." function and then save the sample.

By "appending the sample," you are changing the first byte in the sample file. Later, when you choose the AutoPlay function, Smart Play looks at that first byte to set the speed at which the sample should be played. This does not affect the quality of the sample! Other sample players/editors can use appended samples from Smart Play with no ill affects.

AutoPlay works similarly to slide show programs for picture files. You simply pick the drive and path/folder name and choose if Smart Play should look for that appended byte for speed adjustment (Auto Speed). Once this is done, Smart Play will load any file with the extension".SND". This extension is commonly used for sound sample using the appended byte method.

Sound Editor

Using the sound editor in Smart Play is very simple. First, you load a sample into memory. Two small boxes with arrows facing in opposite directions allow you to edit your sample. The box above the arrows is used to gauge your sample. This box represents your entire sample no matter how large or small it may be. By clicking on the arrows, you can cut out sections from your sample and save them.

After you have begun editing, you can select "PLAY SPL>" to hear the edited sample. When you have finished editing your sample, you can save it by simply selecting "SAVE SPL".

The Manual

The documentation for Menu Plus is the standard fold-over page, 21 pages in all. It is divided into six main sections and is well printed. However, this is about the only positive thing that can be said about the manual. It is filled with glaring misspellings, as well as grammatical, punctuation and organizational errors.

Another problem with such a short manual is that it spends time touring the Main Screen (Chapter 3) and then devotes a separate chapter to menus and submenus. This leads to duplication and makes the overall concept difficult to follow.

The manual would probably have been better organized as Main Screen; Menu Bar; Plus Features -- the View/Prints, etc.; Sound Features; and the Accessory Version.

The Tips and Tricks chapter could also use a major expansion. The manual section on Getting Started should give a listing of the files on the disk and their purpose. The cover shows a screen dump of the Main Menu, but there are no other screen dumps within the manual itself.

Any revision of the manual would appear to need a major rewrite, adding screen dumps, expanding the text, going to a numerical section layout and proofing for spelling and grammatical errors and reorganizing.

Improvements

Where to start? Menu Plus, as it presently stands, needs a lot of modification and improvement. A lot of these (see the summary following) are those that similar menu programs (such as CodeHead's HotWire) already have.

Menu Plus could support keystroke alternates for the mouse selections, plus hotkeys for running programs. It could use a configuration file that senses resolution, so memory allocation prompting would not be necessary every time it is used.

It would be nice if the justification function (L/C/R) could be made selectable for all files listed in the menu windows, as well as just the highlighted file.

Conclusion

Overall I found Menu Plus awkward to use. It is in need of major improvements such as using keyboard hotkeys to give an alternative to intensive mouse use. The manual is in need of a complete rewrite.

In view of the near saturated market for alternative desktops, Menu Plus as a saleable product for Rimik has a tough road ahead. Besides the well entrenched and well-established commercial competition such as CodeHead's HotWire (the One Plus Ultra of menuing systems for running programs), there are other more versatile commercial programs which have built-in text Viewers. Besides these, there are the shareware and public domain programs to view/print text files, play sounds, etc.

It might have been better if Menu Plus had just concentrated on a full-featured application launching program. Menu Plus has the look and feel of an unoptimized program and, additionally, is seriously hurt by the deficiencies of the manual. It's also pricey at the $39.95 list as compared to the powerful, optimized competition such as HotWire.

Knightmare

Kevin Slate

"Welcome to your Knightmare" as the oracle on the wall proclaims.

It's *Knightmare* by Mindscape and it's the latest in Dungeons and Dragons style role playing games. Based on a popular British television show, Knightmare is destined to become a cult classic.

In the game, you pick four heroes and begin your quest in search of four objects—a shield, a sword, a cup and, ultimately, a crown. When you first start the game, you find yourself (and your party) walled in with a single "coal" railway car to bring you to one of four wooded landscapes. The actual quests take place in these "prisons" and it's there your Knightmare truly begins.

Your first task is to determine how to bypass the tree creatures. These creatures guard the entrance ways to each of your four quests. Each quest takes place in a different world and poses a wide variety of perils. The search for the shield has its twists and turns but is not exceptionally difficult. But, by the the time you begin your second quest, for the sword, things start getting Knightmarish.

Just as in the popular *Dungeon Master* from FTL, you pick up objects to store or use while trying to maintain sufficient levels of "health," "stamina," and "magic." These levels are monitored by three bar graphs next to each hero.

Movement is achieved by clicking on arrow icons or by using the numeric keypad, which tends to be somewhat uncomfortable. Unfortunately, the keyboard's arrow (cursor) keys aren't used, perhaps in an attempt to avoid an exact FTL-lookalike. Nevertheless, the interface is easy to use and doesn't prove too difficult to master.

Items you find are stored in a "backpack" which you access by clicking the right mouse button while pointing at one of your heroes. You can also click on a "four party" icon to view all four backpacks' contents at once.

Throughout the game, there are weapons to collect, food to store and eat and objects to be used as you make your way.

The animated sprites are done quiet well and prove to each have their own character. The outdoor scenery is adequate, as are the "dungeons." If you're not satisfied with the game's colors, you can modify them to your liking.

One nice feature is the ability to save up to eight game positions. This is very helpful if more that one person plays the game. (Dungeon Master lacked this ability, wasting valuable disk space.)

Knightmare is destined to be a hit. If you are a Dungeon Master fan, you'll love Knightmare. It fits right in with FTL's adventures as well as its *Captive* counterpart.

Blackjack
Plus
3
A
J
A
J

Bill Rayl

It isn't every day that one comes across a "game" that has real, practical value. Even more unusual is to find a "game" that can make you money. Blackjack Plus 3 (BJP3) from Musicode is such a program.

To call Blackjack Plus 3 a game is a gross understatement of this software's purpose. It would be more accurate to call it a simulation. Blackjack Plus 3 realistically simulates a casino Blackjack table, just like you'd find in Las Vegas or Atlantic City.

The program *teaches* you how to play better at Blackjack, increasing your chances of winning.

As the manual's introduction states, "Learning the basic strategy and taking advantage of the most liberal casino house rules will all but eliminate the casino's edge. This kind of play alone will greatly reduce the losses usually encountered by beginning players."

At the same time, Blackjack Plus 3 is a whole lot of fun to play.

Strategies, Strategies

Blackjack Plus 3 comes with a built-in basic strategy and a "count betting" strategy. You can also set up your own custom strategies and test them to see how well you do against the dealer. The manual recommends a couple of very good books on playing Blackjack that contain useful counting strategies.

In the game, you can "sit down" to a table with up to six other "players." Each player can be run by you or by the computer. A special FEEDBACK mode warns you whenever you diverge from whatever strategy you've chosen. In BACKGROUND mode, the computer goes into overdrive, playing approximately 100 hands in 30 seconds! This mode is very useful for testing strategies over the long haul.

Blackjack Plus 3 can handle up to seven different playing strategies at one time. These strategies can be counting or non-counting. A "Strategy Table" is used to pretty much cover any possible occurrence. For instance, if you've got a hand that adds up to 10, and the dealer is showing a 9 (or any other card), the strategy table tells whether to hit, stand, double down, split or surrender.

Along with the normal Strategy Table, Blackjack Plus 3 has an "Alternate Strategy Table." Depending on how the game is progressing, BJP3 switches between these tables. The process can get pretty complicated, but BJP3's manual does a good job of explaining all the intricacies.

The strategy tables also have the ability to determine how much your next bet should be based on the last hand's result (whether you won or lost). The options are simply astounding.

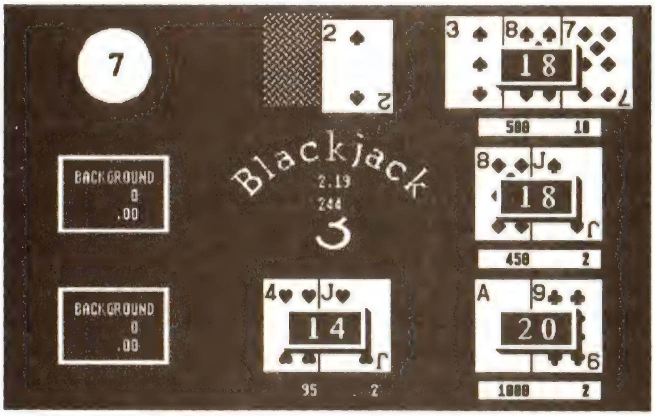
Playing Around

For all its features, the software is extremely easy to use. If you just want to play Blackjack (and perhaps hone your skills a little), you can skip setting up strategies altogether and get right to playing! The tutorial section at the beginning of the manual shows you how to get started right away.

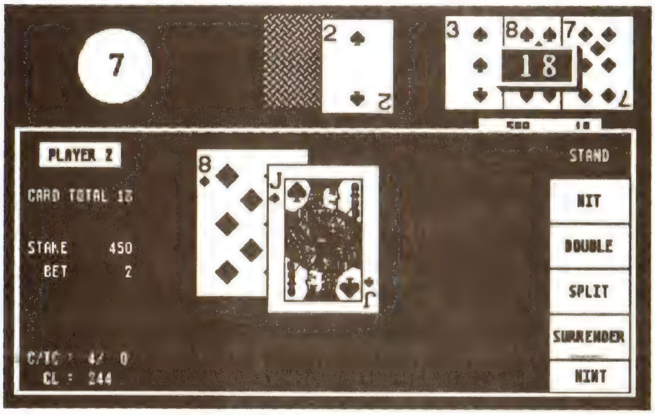
Another nice feature in BJP3 is that you can use mouse, joystick or keyboard to perform just about every gameplay function.

Play Options

Blackjack Plus 3 is not your typical, stripped down Blackjack game. At the Game Setup screen, you can set a num-



ber of options. These options (which includes setting the aforementioned player strategies) make BJP3 the most realistic game of Blackjack you'll probably ever play on a computer.



PLAYER 2

CARD TOTAL 18

STAKE 450
BET 2

C/TC : 4/ 0
CL : 244

Along with the more mundane settings of game speed and each player's "stakes," you can set various House Rules and "penetration." The penetration setting allows you to set the percentage of cards that will be dealt from each deck or shoe (multiple decks).

The House Rules settings include rules for when you can double down, whether you can double down after a split, whether surrender is allowed, etc.

All of these options can be saved to a setup file—set them once and forget them, or change them later to match your favorite casino!

BJP3 also has the ability to keep a log file of your gaming sessions. This log file captures info on all the hands played, as well as statistics on the number of winning, losing or tied hands; total hands played; total amounts wagered; net amount won or lost; percent amount won or lost and more. This log file option is extremely useful when playing in Background mode, as it gives you hardcopy evidence of your strategies' performances over time.

Conclusions

The BJP3 manual does a good job of explaining the multitude of options this software presents. A section on Counting Strategies and separate sections on setting up both counting and non-counting strategies are filled with a wealth of information.

The software is not copy protected (it does ask you to supply words from the manual), so it can be installed on a hard drive. It runs on any ST in medium or high resolution and works perfectly fine on the TT in those ST resolutions as well.

Whether you're planning a trip to Las Vegas to break the casino or just want to play a very good Blackjack game, Blackjack Plus 3 is just the ticket!

TEC
TOS Extension Card

Upgrade your 520ST, 1040ST, Mega ST, or Stacy to Atari's new TOS 2.06!

TOS 2.06

The equivalent of a brand new computer for less than $140!

CodeHead Technologies is proud to announce the TOS Extension Card! This amazing device lets you install the very latest version of Atari TOS (2.06) in your 520ST, 1040ST, or Mega ST!

That's right! Now, you can have the same excellent system software that owners of Mega STes and TT030s are enjoying, without spending megabucks for a whole new computer system.

TOS 2.06 is a major upgrade, including a completely rewritten GEM desktop that incorporates most of the features of the popular alternative desktop programs, but with two big advantages: it doesn't gobble up large chunks of memory, and because it's in ROM it takes no time to load from disk!

The TEC is a tiny card that fits in any model of ST computer, regardless of design. It works with existing upgrades, like MS-DOS emulators or hardware accelerators. If you have a Mega ST, or an ST with a socketed 68000, you can choose one of the solderless plug-in versions. You can even flip a switch and return to your older TOS, to run software that's incompatible with TOS 2.06. And the low price of $139 includes the ROM chips!

Step into the future and order your TEC today!

Disk Management System for the 8-bit

Ellen Lentz (ACCT)

Disk Management System by Ron Fetzer and Stan Schenfeld of the Ol' Hackers Atari Users' Group is a Public Domain, two-disk disk library cataloging system for the XL/XE Classic Atari. It supports the Atari and Epson or compatible printers, although instructions for changes are given in the documentation so any dot-matrix printer can be used.

The package basically consists of two programs, the Quick Cataloger and the Full-Feature Cataloger, with supporting programs for Cleaning Up your disks, printing Disk Labels, Disk Envelope Labels and Title Labels for Commercial disks.

Documentation for the programs is excellent. It appears on the back side of each disk, and can be printed in either 40-column or 80-column format.

The Full-Feature program is written in Atari BASIC. It allows you to auto-catalog your disks. For each file, you can specify data such as description, type of file, source and whether it's BASIC or ML. Commercial disks may also be recorded. All records can be updated, and an Inquiry into all records may be made in three different modes.

The catalog can also be sorted by any of seven different fields. The user has a choice of disk drives and database names for cataloging and sorting. The software can handle up to 500 records and the data is saved automatically.

The Quick Cataloger and supporting programs are written in Turbo-BASIC XL (supplied with the programs) and uses a RAM-Disk to store the catalog, which is then copied to a regular disk at the end of a session. It can handle up to 810 files. A count is given of your files as you catalog each disk so you know when you're approaching the maximum.

If you think you have more files than these programs can handle, simply organize your disks into categories such as Public Domain, Commercial, Personal or Mixed, and catalog each category separately.

You must supply a disk name, 5 characters long, which will be recognized by either catalog program. This name is then written to the disk, so you must have at least one free sector on each disk and the disk must not be write-protected.

The disk name can be all numeric, or a combination, such as PD for Public Domain and a number 1-999 (i.e., PD001). Suggested names are PP (Personal Programs), CM (Commercial programs), MX (Mixed programs). You can use the individual option for Commercial programs and the disk name will not be written to the disk.

The Clean Up program allows you to remove unwanted files from your disk and assures that you have one free sector left for the disk name. It provides some DOS functions such as Erase, Lock, Unlock, Rename and Format.

Print Directory prints each file name with a description line that you may want to use in the Full-Feature Cataloger. The Text Reader function will load and display any file except Graphics files. You may then be able to identify the type of file you are working with.

The program is stored in the RAMdisk, so if you go to DOS to copy a file to another disk, you can go back to the program by typing (in BASIC) RUN D8:CLEANUP.

The Sticker program prints one 15/16x3.5 label with eight disk designations you can cut apart to put on your disks. Or, you can print a 4x6 index card which you then put in the envelope with your disk.

The Disk Label program prints an alphabetical listing of your files on 15/16x3.5 pressure-sensitive labels in condensed mode. It will print 27 files on each label, for a total of 54 files per disk. It will not print DOS.SYS, DUP.SYS or RAMDISK.COM. It asks for a Sort and will not print if the answer is NO.

The Disk Envelope Label program prints an alphabetical listing of your disk directory. You can glue or tape this onto your disk envelope or print it on a 4x6 index card. It will print up to 64 file names, ignoring DOS.SYS, DUP .SYS and RAMDISK.COM. If an error occurs during printing, type in CONT and the program will usually continue.

The Title Label program prints a three-line disk label for commercial disks or other disks that are based on one subject. It can also be used to print address labels. It prints in Caps, but can be set for lower-case by pressing the Caps key. It centers each line, and can print multiple labels.

The Quick Cataloger program uses the RAMdisk D8: to store the cataloged files. It reads the directory for all your files and prepares an Alphabetical or Numerical file, showing disk name, filename and number of sectors. It stores all your files in the master file DISKFILE, so if you are sub-dividing your files into PD, CM, etc., you must use a separate disk for each category.

If you are beginning a session, you would choose Option 2—Load File. For further additions to the file in another session, you must first go to DOS, copy DISKFILE to D8:DISKFILE, then choose Option 3—Add New Disks. To get back to the Quick Cataloger from DOS, choose Option L and load AUTORUN.SYS. There are very good prompts for this in the program itself.

To catalog the disks, remove any write-protect tabs from the disks and insert one after another into Drive 1, following the prompts, until all disks have been cataloged. You supply a 5-character disk name as described above. If there are no free sectors left on the disk, or no files on the disk, you will get the message 'REMOVE WRITE-PROTECT TAB' and you will not be able to catalog that disk in the normal way. You can add or erase Individual disks and the program will not write to the disk.

When you have finished cataloging, choose the Sort File option and give a Sort-file name. Once the sort is complete, you can either Display the file or Print it. The software gives the number of files you have cataloged, to be used in subsequent sessions when you want to add new disks.

Always end your session with Option 9—END. This will prompt you to go to DOS and copy your D8:DISKFILE to D1:DISKFILE. You may save the other files if you wish, but they are not necessary.

The prompts in these programs are excellent. You can specify the density of each disk and the printer you will be using. The label programs all allow you to adjust your labels first.

Since the Quick Cataloger program is easier to use, it would be nice if someone would write a small program to convert the DISKFILE from the Quick Cataloger program to the format of the Full-Feature program. Then you could use both programs with only one pass of your disks. The Full-Feature program has an Inquiry option which is lacking in the Quick-Cataloger, although you do have your sorted print-outs to which you can refer.

This system is highly recommended for those who wish to get their disk files organized. For further information or comments, you can contact Ron Fetzer at 22 Monaco Ave., Elmont, NY 11003. For copies of the system, please send a check for $6 (made out to Ron Fetzer, the club's treasurer) to: Ol' Hackers AUG, Inc. c/o Alex Pignato, 3376 Ocean Harbor, Oceanside, N.Y. 11572.

Topics are still needed for articles, so if you have a program you would like to learn how to use, or one you would like reviewed in AIM, send a copy of the program and all documentation to:

Ellen Lentz, 512 Pauly, Perrysburg, OH 43551, (419) 874-7196.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SI

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

SHIPPING And HANDLING is always just $3 in North America and $5 Internationally, regardless of quantity of *KE-SOFT* products ordered. NO State Sales Tax is due.

A-T-A-R-I

ANSWERS, TIPS AND RELEVANT INFORMATION

HARDWARE HACKING

Paul Alhart (AFED)

When I was young, I loved to take things apart. I wanted to see how things worked or, in some cases, see why they didn't work.

My grandfather kept me well supplied with old machines and gadgets to tinker with. I always assumed he did this because he shared my "What makes it work?" interest. Most likely he was really trying to keep me too busy to think about dissecting Grandma's new TV.

Beginning Hacking

In any case, I eventually learned to put most of the things back together and even got some of them to work again. I also learned that with a little modifying or "hacking," some things could actually be coaxed into working better, or more to my liking, than before. At last, true justification for taking good, new, functional things apart! Like Peter Pan, I would never have to grow up.

A Better Mouse Trap

I never did outgrow my hacking urges. My brand new Atari 1200XL wasn't in the house more that 15 minutes before I had it apart and spread all over the living room floor. I wasn't yet sure how it worked, but I was sure I could make it work better.

Over the years since then, my entire system has been apart and modified many times. Nothing has been spared, from the printer to the drives. And yes, it does work better now, or at least more to my liking, than ever before.

My latest hack I call an Atari 2000XL+—an 800XL inside a 1200XL. Why? I have always liked the 1200XL keyboard the best.

No other model, or other brand for that matter, has a keyboard I like better. I had also been using a 256K 800XL to test out the Ultra Speed Plus OS from Computer Software Systems.

"Home Brewed" Computer

When it finally dawned on me that I could not part with Ultra Speed or my 1200XL keyboard, there was only one thing I could do. A little investigation showed this would not be just a simple plug in modification. The 1200XL keyboard has built in decoder chips while the 800XL has its keyboard decoder chips on the motherboard.

Room was another consideration as the 1200XL and 800XL motherboard layouts are completely different. Besides hacking, a lot of hack sawing on the case and RF shield was required to get everything to fit.

The end result, however, is a computer that looks like a stock 1200XL except for a cartridge slot added to its top face. I was surprised to find that the 1200XL function keys are supported by the 800XL OS and still work as before. I am using the 2000XL+ to write this article and it sure feels good to have my favorite old keyboard to type on again.

New Projects

What's next? How about warp-speed for my Rana disk drives? Or expanding the RAM in my printer buffer? Whatever it is, I'll let you know, but first I need to take time and tell you what the Ultra Speed Plus OS is and why I couldn't live without it. Look for a review of US+ in A-T-A-R-I in the near future.

Till then, enjoy, and keep those cards and letters coming my way to let me know what you want to hear about.

Spectre GCR Modifications

George Richardson

[Ed: George Richardson and Gadgets by Small have given us permission to run this article in the hope that it helps GCR owners experiencing the problems outlined in this article. There are other articles and text files appearing that claim to fix these problems. Please, DISREGARD those other articles as they may contain information/procedures that could cause you problems!

As with any hardware modification, Atari Interface and/or its staff cannot be held liable for any damage incurred from your performing this modification. If you are unsure of your ability to perform these modifications, DON'T DO THEM YOURSELF!]

The Spectre GCR has a number of problems when used with an Atari TT. This is caused by the fact that the 68030 processor has begun to change the state of the address lines by the time the cartridge select line goes false, something that does not normally occur in the regular ST computers. These problems can include the following:

Getting the "defective ROM" message at boot time
Difficulty formatting GCR (Mac) floppies
Difficulty writing to GCR (Mac) floppies
Difficulty reading GCR (Mac) floppies

The floppy problems can be detected by using the GCR test program included with Spectre.

These problems may, in some lesser degree, occur on machines with 68030, 68020 or 68000 accelerators. They might also occur on machines that have heavy loading on the address bus, like a Mega ST with Blitter, Moniterm card and GCR, or a GCR and six EPROM TOS set.

There are *three* separate fixes that can be done to the GCR. They should *all* be done to get best performance with the TT.

I should note that these are only GCR hardware fixes; there are some problems with the TT and Spectre 3.0 that will be corrected by future Spectre software releases. An example of this is the problem using floppy disks with the 68030 caches turned on. The current solution for this is to get one of the Macintosh desk accessories that allow you to turn off the caches so you can use floppies when required.

There are also some hardware problems with some TTs that are *not* caused by Spectre's software or the GCR's hardware. You should run the floppy drive test on the GCR tester to determine if your drive and system is up to snuff. If it doesn't pass, no amount of fixes to the GCR or Spectre software will help you.

Also, there is a small fuse in the power supply line to the cartridge port on the TT. If this fuse is blown, the GCR cartridge will not function. Check with a voltmeter to be sure the GCR is getting power. Pins 7 and 14 of U4 are a good place to check with a voltmeter. Pin 7 is the negative side and pin 14 is the positive side. There should be about 5 volts DC between these pins.

The Fixes

There are three parts required for the GCR fix—no substitutes please! Any substitution of parts can produce side effects, like the complete inability to use the GCR.

The three required parts are:

One 74LS04 chip (NOT an S04, ALS04, HC04, AS04 or 7404)
One 100pf capacitor (35 Volt, monolithic ceramic, one of the little blue or yellow blobs. Do not use a disk cap!)
One 1K Ohm, 1/4 watt 5% tolerance resistor

OK, the first step is to trim all but pins 7 and 14 on the 74LS04 short. Note that I said *short,* not off. If you cut off all of the thin part of the lead so that none of it protrudes below the base of the chip itself, that will do fine. This is only so that none of the pins touch any of the pins on the chip we're going to solder it on to. Pins 7 and 14 are the power pins, and we'll use those both to get power from another chip, and to hold the 74LS04 onto the GCR.

Now, locate U4 on your GCR. If you hold the GCR so that the gold connector is facing you and the disk connectors are on your right, U4 is the third chip in from the left on the top edge of the GCR. (We'll also use this orientation to locate the rest of the chips we'll be dealing with.)

Position the 74LS04 on top of U4 so that their pins line up, 1 to 1, 2 to 2, et cetera. This means the notch or mark on the ends of both chips must be facing the same way. Solder the 74LS04 chip's pins 7 and 14 to pins 7 and 14 of the U4 chip, so that the 74LS04 chip is riding piggyback on U4. These are the only connections to be made to U4. all other connections will be made from the piggyback 74LS04 to other chips.

Find U3, just to the right of U4. Cut the trace connected to pin 9 of U3. It's located on top of the board. Then, connect a wire from pin 8 of the 74LS04 chip to pin 9 of U3.

Find U2, just to the right of U3. Connect a wire from pin 9 of the 74LS04 to pin 9 of U2.

Find U6, on the lower left side of the board. Cut the trace connected to pin 12 of U6. This trace is also on the top side of the board. Then, connect a wire from pin 10 of the 74LS04 to pin 12 of U6.

Connect a wire from pin 11 of the 74LS04 to pin 11 of U2.

Now the tough stuff. Solder the 100pf capacitor between pins 2 and 3 of the 74LS04. This can be done in such a way as to allow the capacitor to lie flat against the top of the chip. Then solder the 1K resistor between pins 3 and 7 of the 74LS04. Make sure that these parts don't touch any other pins on the chip.

Connect a wire from pin 1 of the 74LS04 to pin 10 of U2.

Then, find U10, which is just to the right of U6. Cut the trace that connects to pin 10 of U10, leaving the trace between pins 9 and 10 intact. All of these traces are on the underside of the board. Finally, connect a wire from pin 4 of the 74LS04 to pin 10 of U10.

Run the GCR test. Boot into Mac mode. If you did everything correctly, you should now be running fine.

On the off chance that you're not, but everything seems to be wired correctly, short out the leads of the capacitor and try it again. If things work better, try substituting a 120pf or 150pf cap for the 100pf.

If you would like to do this modification but don't have the experience or know anyone who does, Merlin Group can do the modification for you for $25.

[George Richardson of Merlin Group, Inc. is the designer of Gadget's by Small's MegaTalk board and SST 68030 upgrade board. He can be reached at (201) 998-4441 or via Email on CompuServe at 75275,1363 or via GEnie to G.RICHARDSO1.]

CALL FOR OUR COMPLETE CATALOG!

Delphi—A Great Place to Be

Gordon Meyer

Most of us are familiar with those friendly, yet diverse, collections of Atari users we call user groups. Folks with interests ranging from desktop publishing to games to MIDI-based music all come together in one place, bound by their mutual attachment to the Atari computer. A user group meeting is somewhere novices can find help with unfamiliarities and 'old-timers' can catch up on what's new in the Atari community.

And, fortunately, for those of us who have been bitten by the telecomputing bug, there is an on-line service that is very much like a user group. Beginning as an on-line encyclopedia in 1982, Delphi has grown into a solid resource for a wide variety of computing and non-computing interests. From photography to environmental concerns, Delphi offers a place for modem users to come for information.

The ST Advantage is the home for Atari users on Delphi. (The ST Advantage also includes special topics and databases for Atari 8-bit users.) Managed by Clay Walnum, former editor of ST-Log magazine, the ST Advantage has grown to be one of the busiest areas on Delphi.

A continual supply of new program files streams into the Databases. Both public domain and shareware releases are available, as well as several on-line magazines. All new files are placed in a special Recent Arrivals database for about a month, before being merged into one of the 14 regular databases. This makes it easy to see what's new since the last time you were on-line.

The ST Advantage area sees its fair share of message posting, on subjects from using a multi-sync monitor to tips on the latest games. The friendly atmosphere is much like your local user group. Frequently, long time users answer questions from those who have just gotten their STs. Sometimes it's a question about how to use Delphi more efficiently. And occasionally, it doesn't have anything to do with Atari computers or Delphi at all.

Another feature that makes the ST Advantage more like a user group is the weekly Conference (CO). Held every Tuesday evening at 10PM Eastern time, members gather in the Conference area and share the immediacy of a real-time get-together with their fellow Atari users. Several developers make regular visits to the weekly COs, and their participation always makes for an interesting evening.

As perfect as all this might seem, it is important to note that Delphi is a pay service. You are charged for your time on-line. However, Delphi has the lowest rates in the business, as little as one dollar an hour.

There are two plans. Basic access service costs $5.95 per month, and includes one hour of on-line time. Additional hours are just $6.00, for access at any modem speed. And there is no sign-up fee for basic access.

If you find you spend more than 3 hours a month on-line, you might consider Delphi's 20/20 Advantage Plan. For $20 a month, you receive 20 hours of on-line time, with additional hours billed at just $1.20! Now that's power without the price!

There is a sign-up fee of $19.95 for the 20/20 Advantage Plan, but you'll save that much in access charges your first month. Advantage Plan hours run from 7 PM until 6 AM on weekdays, and all weekend, so there is plenty of opportunity to use up those 20 hours, and more.

The 20/20 Advantage Plan hours can be used anywhere on Delphi, so you can feel free to explore all the system has to offer. Delphi has SIGs devoted to almost every computer type, as well as several machine-independent computer SIGs, like graphics and desktop publishing.

But Delphi doesn't limit itself to computing. The Photography Forum is there for photographers, both amateur and professional. The Environment SIG offers a 'green' place for interested Delphi members. The Science Fiction & Fantasy SIG has regular Conferences, where well-known SF&F authors stop by to visit with their readers.

The GameSIG is hosted by Scorpia, a well-known writer for a variety of gaming publications. It's a great place to get hints on computer games, as well as non-computer games. The World of Videogames offers the latest news and tips for video-game enthusiasts and is sponsored by the staff of VideoGames & Computer Entertainment magazine.

There's even a special area hosted by the comedians Penn & Teller, where almost anything can happen!

Delphi also offers all the usual on-line services. There are on-line encyclopedias, travel services, financial information services, on-line news and sports and several specialized databases. You can send ASCII fax messages via Delphi for a modest fee. And there is an extensive on-line shopping service.

On the 20/20 Advantage Plan, you pay just $1 an hour for access to almost everything on Delphi. There are a few special surcharged areas, but even with the surcharges added on, the access rates are still very reasonable. And you are always notified before you enter such an area, so you don't have to worry about accidentally racking up extra charges.

Delphi's atmosphere is laid-back and relaxed. If you post a question about a problem, it will most likely be answered within a day or two, by someone with expertise to share. Even Atari celebrities are readily approachable and happy to answer questions, hear comments or, sometimes, just chat.

Delphi isn't some formal, stuffed-shirt on-line service. It's more of a T-shirt and jeans place, where you can sit back and be yourself. See you on-line!

To join Delphi, use your computer and modem to call 1-800-365-4636. Press return twice. At the *Username:* prompt, type JOINDELPHI and at the *Password:* prompt, type INTERFACE.

MEGA-Check

The Ultimate Finance Manager

Take charge of your finances with the most complete finance manager for the Atari ST

- ☑ Pay any bill with a single mouse click or keystroke
- ☑ Built in ***PayMinder*** alarm system
- ☑ Fully automated checkbook balancing
- ☑ Print checks on any printer
- ☑ Support for any number of checking, savings, investment and expense accounts
- ☑ Also allows grouping of accounts
- ☑ Full featured report generator (with scheduler)
- ☑ Can convert ASCII data from other packages
- ☑ Perfect for small businesses
- ☑ Full GEM interface, color or mono, on all Atari ST computer systems

$39.95 + $3.00 s/h

AIM Mac/Spectre Disk of the Month

Each AIM Mac/Spectre Disk of the Month is a double-sided disk packed with some of the best PD and Shareware programs available each month. The disks are available in either Macintosh or Spectre formats. All files are self-extracting Compactor Pro archives. Just double click to extract!

We have a number of HyperCard stacks this month. These files, in most cases, require HyperCard version 2.0 or higher.

Here is a short description of the files contained on the April '92 Mac/Spectre Disk of the Month:

Auto Maintenance—A HyperCard 2.0 stack that allows you to track your automotive expenses.

Bar Codes—Ever wonder what those Bar Codes you see on packages really mean? This HyperCard 2.0 stack will tell you.

Hyper PhotoFile—If you're a photographer (or someone who has lots of pictures) this HyperCard stack helps you keep track of everything. This stack runs under HyperCard 1.2.2 or higher.

Now, on to the non-HyperCard stuff!

AppSizer—A utility to help you adjust the memory usage of programs running under Multifinder. Great for solving some conflicts.

Measure 1.7—An application to convert different units of measurement. Handles Linear, Area, Volume, Weight and Temperature conversions. Supports such things as converting Acres to Hectares, Gallons to Liters or British Gallons (and vice versa) and Fahrenheit/Celsius/Kelvin temperatures.

ZoomBar—An init that allows you to shrink application windows to a small bar. Very useful when running under MultiFinder or when your desktop is getting a bit too cluttered! Can automatically shrink and expand windows with a single click.

Open-Wide 2.6—This init modifies your system's file dialogs to allow wider filenames. Now you can see or type in full 31 character file names without scrolling a tiny little section in a dialog!

Simpsons Init—This one's just for fun. This archive contains an init that displays the whole Simpson family, in icon form, when you startup your "Mac." Has built-in digitized sound, too.

Mombasa 1.1—A Gunshy/Shanghi (Mah Jongg) type game. Very well done. Much better than Gunshy 1.2.1.

Toxic Ravine 1.1—Orlando Pool's Toxic Ravine Cleanup and Rescue is another game from the author of Mombasa 1.1. Nicely done with pretty good graphics. Can you save the world from the destructive genetic waste in the Toxic Ravines?

Eliza—A Macintosh version of an old favorite. Tell your troubles to your Mac...er...Atari. This version supports digitized speech (using MacinTalk) and can be used as a small, no frills word processor.

MacinTalk—An Apple system extension that allows digitized speech. Simply place it in your system folder and reboot.

MineSweep 2.01—A game where the object is to clear a mine field as quickly as possible. The game includes its own help file.

Readers can purchase this disk by sending $6 ($5+$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, or call (313) 973-8825 and have your Visa or MasterCard ready. Please specify the April '92 Mac/Spectre Disk and which format when ordering.

AIM ST/Mega/TT Disk of the Month

All files on this disk are self-extracting archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.
Here's a short description of the files on the April '92 disk. For more complete docs, see the text files contained in most of these archives.

ARKCON17.APP—Arkade Controller 1.7 controls sending FoReM BBS files to games, command lines, data file creation, doc file viewing, game file viewing, utility programs for games and more. All set up with a simple setup script. Designed for Express ST BBS 1.72 or higher. Shareware.

EDHAK23D APP—EdHak 2.30 demo. Fully functional as an editor for QuickCIS, but limited to a 4K edit buffer. When used by itself, it will not save to a file or disk sectors. Adds roughly 20 new features since version 2.25, including ability to function as a capture buffer for STalker (distributed by Gribnif), buffer conversion to/from hex, support for Atari clipboard for block saves/merges, expanded help screens, auto-indent and much more.

EMPIRE20.APP—Galactic Empire online game for Michtron's BBS 3.0. Another great MCL game written by Jeff Wells.

FZT_D211.APP—FreeZe Dried Software Terminal 2.11. This version is faster, adds background dialing and more. FzDSTerm is the only currently available terminal package for the ST/TT line that properly handles ANSI. TT Compatible in ST and TT Resolutions. Shareware. [Ed: See the review in this month's issue!]

MTALK105.APP—MicroTalk 1.05 is an on-line reader/reply program for Qmail for the PC and Turbo BBS or MaxiDoor for FoReM. Message bases chosen are scanned, compressed and downloaded. Later, you can read and reply off-line! Fully GEM based with multiple windows for switching message bases, user defined macros, text block commands, text export, clipboard support, full mouse or keyboard operation and much more. Freeware.

SEEKER.APP—Gold Seeker, a Lode Runner-type game with moveable trap doors, exploding bombs, diagonal slides, moving sidewalks, controllable force fields and an elevator. Allows you to create your own screens. Comes with 32 screens! Color only.

SNOFITE.APP—A great Shareware game from Larry and Kevin Scott. Even in the summertime, you can now enjoy a good snowball fight! Throw snowballs or slushballs and build snowmen in this fun two-player game. Color only. Works great on the TT in ST low resolution.

TTTIMERS APP—Two programs for fixing/finding problems with system clock speeds. CHECKRTC compares elapsed time according to the Real Time Clock with the elapsed time as measured by the 200Hz system tick counter. It reports any differences in terms of seconds/day lost or gained. TTTIME is a CPX module from Software Development Systems that allows you to set your system clock to run slower or faster. Requires XCONTROL.ACC. TTTIME can be used on any ST/TT machine, while CHECKRTC works only on the TT.

VENDOR.APP—VENDOR.ACC is a mini-database that comes with a datafile containing name, address, phone and CompuServe user ID info for software and hardware vendors that service the Atari community. Future updates to the VENDOR.DAT file will be available on CompuServe.

The following files were submitted by TLC Software's Tom Hayslett. Tom has been a major Shareware author and ST supporter for many years. Some of his programs have appeared on past ST disks. Here are the latest versions of just a handful of his many fine programs.

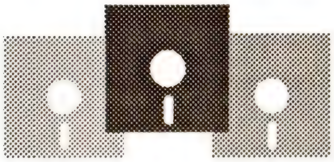
TLC_FIXR.APP—The File Fixer allows easy searching and replacing of ASCII text strings within programs. It will load and search/replace up to 20 files. Great for shareware authors that personalize their programs. ACC or PRG. Shareware.

TLC_FORM.APP—The Formatter is a disk formatter that formats backwards, can do a 'hard verify' and formats using the "dead sector" scheme to make disks read/write faster than twister format. It will detect drive B: and allow auto formatting of two disks. ACC or PRG. Shareware.

TLC_NAMR.APP—The File Namer allows you to use any of the STs extended character set in your filenames (i.e., copyright or Fuji symbols). ACC or PRG. Shareware.

TLC_PLAY.APP—The Sound Machine loads and plays digitized sound files from SoundOff!, ST Replay, MasterSound, DigiSound, and more! You can reverse, stretch, squeeze, amplify, or soften sounds as well as change speeds. Allows endless looping and saving modified sounds in several formats. Shareware.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108 or call (313) 973-8825 and have your Visa or MasterCard ready. Please specify the April '92 ST/Mega disk when ordering.



8-bit (Classic) Disk of the Month

April, 1992

Each AIM 8-bit Disk of the Month is a single-sided, single density "flippy" packed with software. To extract files in the ARC format, you need the UNARC .COM utility. To decompress files with a DCM extension, you need DISKCOM3.UTL. Both programs are available from most BBSes, user groups or you can purchase the April/May '91 AIM 8-bit Disk.

Here's a short description of the files on the April '92 8-bit disk:

LOAN.ARC—A BASIC program for calculating various loan options. Documentation gives concrete examples of the types of questions and calculations this software can handle. Submitted by Kevin Packard and WNYAUG.

INVEST.ARC—This BASIC program, a companion of sorts to LOAN.ARC, does a good job of answering practical questions about investments. Documentation also gives concrete examples. Submitted by Kevin Packard and WNYAUG.

PSINDXER.ARC—A program to produce a list of the names of Print Shop Icons in ASCII format so that they can be printed out. Docs are included.

SUPRINDX.ARC—SuperIndex and IndexPrint, two programs for cataloging your diskette library. If you need to get your disk library in order, these BASIC programs are just what you're looking for. Submitted by Michael Bennett.

VIEW83.ARC—VIEW8.APP is a Graphics 8 picture viewer for the Diamond GOS Cartridge 3.0. Uses the Diamond cartridge's file selector routine and looks for files with the extension of .GR8. Requires Diamond GOS version 3.0. Written by Kevin Packard (WNYAUG).

UTILS1.DCM—Side 1 of a collection of disk utilities written by Les Wagar. Programs include

DISK—a file loader with DOS functions;

DISKUTIL—a disk editor with file restore, sector copying and other nifty features;

DISKNAME—a program for adding titles to or personalizing of disk directories;

FREEZAP—a utility to set disks to reports 000 free sectors; and

VTOCKEY—a VTOC tester and rebuilder for damaged disks. Simply decompress and boot Side 1 to access the programs or boot Side 2 (see UTILS2.DCM) to print the documentation.

SIDE 2

RECORD.ARC—A Diamond GOS accessory that adds background music to most .APP programs. This accessory allows you to turn on and off the motor of a Program Recorder. The audio track of the cassette can then be heard through the monitor. Requires Diamond GOS and an Atari Program Recorder. Written by Kevin Packard (WNYAUG).

SSS.ARC—The Atari Sampled Sound System contains programs to convert, play and edit the many sampled sound files available for computers. One program requires Turbo Basic. Shareware from IPC Software.

UTILS2.DCM—Side 2 of the Utilities Disk from Les Wagar. This side contains complete documentation for all the programs, along with a documentation printer program. Uncompress to Side 2 of your newly-created Util. disk and boot from this side to autorun the documentation program.

Readers can purchase this disk from their local AIM participating user group or by sending $6 ($5 +$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108 or call (313) 973-8825 and have your Visa or MasterCard handy. Please specify the April '92 8-bit Disk when ordering.

ALABAMA

Birmingham ACE
5822 5th Terrace S.
Birmingham, AL 35212
Alan Brewster (205) 591-9906

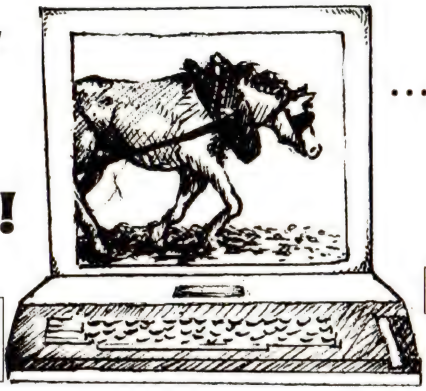
Make your 8-bit a Workhorse!



...with power products from Computer Software Services

Power Products for your XF551

$99.95 THE XF SINGLE DRIVE UPGRADE $99.95

Double the storage capacity of your XF551 with our 3.5" 720k **single drive upgrade!** Included with the upgrade is a Sony 3.5" disk drive in a 5.25" faceplate that perfectly replaces the existing 5.25" drive. The 3.5" drives are newer technology, more reliable, and easier to handle. Do NOT confuse this with public domain upgrades! The completely re-written drive OS adds these features:

- **Fixes incompatibilities** with commercial software
- **Eliminates** density **reconfiguring problems**
- Switches to second side without reconfiguring
- **Ultra Speed** I/O compatible
- Very **high speed** sector skew in US mode
- Capable of reading **IBM** and/or **ST** disks
- Compatible with 40 OR 80 track drives

Included with the upgrade is a utility program capable of reading IBM and/or ST disks, so you can import text or binary files to your 8-bit (text conversion routines are included). Minimal soldering is required; but we provide free installation for any of our products! Only $99.95 plus $8 S/H/I. If you already have a 3.5" drive, you may obtain the single drive upgrade without the Sony drive for $59.95 plus $5 S/H/I.

$139.95 THE XF DUAL DRIVE UPGRADE $139.95

Our XF Dual drive upgrade allows you to **add** a 3.5" drive to your XF551, while keeping the 5.25" mechanism. This is a totally **switchless** upgrade that turns your XF into two disk drives! The added 3.5" drive assumes the next drive number higher than the 5.25" and is totally independent, so you can copy between drives, even mixing densities! This product has all of the features of the above single drive upgrade, available for **both** drives! Complete with Sony 3.5" drive, only $139.95 plus $8 S/H/I. The upgrade without the drive is $79.95 plus $5 S/H/I. A special version to handle dual 3.5" mechanisms is available for an additional $20.

THE FLOPPY BOARD $109/149

The Floppy Board has arrived! This long-awaited Black Box add-on has been in the making for quite a while, but we've packed it with features that are worth the wait! This sophisticated device allows connection of up to four 5.25" or 3.5" floppy drives (drive sizes may be mixed). Access to these drives will be at parallel bus speed, approaching that of hard disks!

The board consists of 13 special integrated circuit chips, fully powered by the power supply of the Black Box. It has its own on-board microprocessor to take the load off the computer's processor for disk I/O. The board and fits perfectly over the Black Box (inside the custom cases!). It is not a stand-alone device; it must be used in conjunction with the Black Box.

High density disks are supported, so 1.2 meg 5.25" and 1.44 meg 3.5" drives may be connected. This is the only 8-bit controller to fully support these drives and densities! With four 3.5" 1.44 meg drives connected, you can achieve more total storage than a 5 meg hard disk! Archiver compatibility is supported! This means you can back up those titles no longer available. Although it's not as powerful as our Super Archiver, it will have the same editing power, with good backup capability.

Software included with the Floppy Board includes a utility to READ and WRITE IBM and ST disk formats! This will yield the easiest possible way to port text and data files between your 8-bit and ST or PC! This will be compatible with most all of the current formats. Also included is a high-speed sector copier designed to make extremely fast, verified copies of disks. A future upgrade to the Hard Drive Pro Backup (our hard disk backup tool) will make special use of the floppy board, and squeeze even more data on each disk than standard formats allow. It is possible to actually store 1.6 megs of data on a 1.44 meg 3.5" drive, so backing up a full 20 meg hard disks might only take 14 disks! Usage of the Floppy Board's on-board processor will allow overlapping reading and writing, making the backup really fly.

Two versions are available: the basic unit, and the Deluxe version. The basic unit provides the interface necessary for low density drives (360k for 5.25" and 720K for 3.5"), and comes with the IBM/ST transfer utility. The Deluxe version adds the high density capability, adds Archiver compatibility, AND adds the features of the Black Box Enhancer, which include a high-resolution 16 grey scale printer screen dump, and a powerful built-in sector editor, disassembler, and copier (which accesses the full 16 megs possible of hard disk partitions, and uses all available extra memory). Note: the Floppy Board replaces the ROM on the Black Box, so current Black Box Enhancers cannot be used with the Floppy Board.

The basic unit is only $109.95, and the deluxe unit is only $149.95. Add $5 for shipping/handling.

Power products for your XL/XE computer

~~$69.95~~ THE ULTRA SPEED PLUS OS ~~$69.95~~

The Operating System that should be in every XL/XE computer! The **ULTRA SPEED PLUS** puts unbelievable speed and convenience at your fingertips. After using it a while, you'll wonder how you ever got along without it! Use **ANY DOS** to place **ULTRA HIGH SPEED** formats on your disks (with XF551 or modified 1050 drives), reconfigure and boot any drive (1-9 or even your **RAMDISK!**), sector copy single and double density disks to your RAMDISK, activate a built-in **400/800 OS** for compatibility, and much more! Below are a list of features. Only $59.95 + $5 S/H/I.

- **ULTRA SPEED SIO** for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from RAMDISK
- Special timer circuits not required for 1 and 2 megs
- Background colors adjustable
- Reverse use of **OPTION** key
- Toggle internal **BASIC**
- Built-in drive number editor (including RAMDISK drive)
- Toggle screen off for up to 40% increase in speed
- **DOUBLE DENSITY RAMDISK** handlers
- **ENTIRE MEMORY TEST** that pinpoints defective RAM chips
- Boot any drive (1-9) on cold start
- Supports ALL XE-compatible memory upgrades up to **two megabytes**
- **THREE** Operating Systems in one **(XL/XE, 400/800, ULTRA SPEED PLUS)**
- **COLD-START** without memory loss
- Built-in mini sector copier
- **RAMDISK** exactly duplicates floppy drive so sector copying and editing are possible

$199.95 THE BLACK BOX $199.95

The **BLACK BOX** is a parallel-port device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It is a T-shaped board with two buttons, two switches, and a set of dip switches visible from the outside. The **BLACK BOX** performs three main tasks: interface to a SASI/SCSI bus (for interface to most common hard disks), a parallel printer port, and a RS232 (modem) port. You may partition your hard disk(s) into as many drives as you wish; up to 9 may be active at any given time. By pressing one of the buttons on the **BLACK BOX**, you will enter the configuration menu, where you can re-assign drive numbers, swap partitions in and out, etc. When you exit, you will be returned to your program – undisturbed! Each hard disk partition has its own write-protect flag, and may be set to single or double density. Every hard disk may be write-protected with the flip of a switch. As an option, you may use your computer's XE RAM as a printer buffer, or order the BLACK BOX with 64K of on-board RAM.Another amazing feature of the BLACK BOX is the built-in **screen dump**. By simply pressing a button, the contents of your screen will be dumped to your printer! (You can define text or graphics modes with a switch!) The RS232 port supplies the full spec signals for added compatibility. Its handler takes up no user memory, and can handle 19,200 BAUD! A **machine language monitor** has been added to allow memory disassembly, memory/register changes, and more. The basic **BLACK BOX** unit is $199.95, and $249.95 with 64K RAM (for printer spooler). S/H/I is $8. An optional custom BLACK BOX case is available for $39.95. The Black Box is a product of Computer Software Services... Not the Black Box Corporation.

HARD DISK SYSTEMS

We offer complete, ready-to-run hard disk systems from 5 megs on up! These systems include a hard disk, Black Box, power supply, controller, cables, and software. Everything is pre-formatted and tested, so all you have to do is plug it in and boot! Prices start as low as $399. Call for the latest prices and specials!

INSTALLATION AND REPAIRS

Althoough installation of any of our products is easy, by taking advantage of our free installation offer, you can rest assured it will be done right. All you pay is the freight charges.
For repair of Atari 8-bit computers and drives at reasonable rates, contact our repair department at (716) 429-5639. All work is guaranteed, and there are no minimum estimate fees.

TWO FOR ONE DEAL!

If you have two or more of the same items needing repair and don't want to spend any money... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE - we'll keep the other defective one for parts! Please call before sending anything in.

We carry many other items - call for our FREE catalog!

Dealer/Distributor/User Group discounts available–call for info.

We accept VISA and Master Card. NY Residents please add sales tax.

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs are preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari TT/030, HP Laserjet II with PacificPage PostScript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.

Editorial Ramblings

This issue is getting to you a little later than we had planned. Because we were going to the Toronto show and had a very good chance of getting a peek at the Falcon 030, we decided to hold the issue for a week. That way, we could get a show report and a Falcon preview article into this issue.

Well, we did go to the Toronto show and we did get to see the Falcon 030 (see the write-ups in this issue). But, we both also caught a *very nasty* flu bug that wiped us out for a whole week-and-a-half.

So, this issue you now hold in your hands is a few weeks later than normal, and at least a week or two later than we would have liked.

We hope you'll find that the issue's contents, especially the Falcon 030 article and show report, more than make up for the delay. While the Falcon 030 is definitely not a replacement for the Atari TT, we think Atari has one heck of a great product for the home computer market in the Falcon. For multi-media, entertainment and other areas relying heavily on graphics and sound, Falcon 030 simply can't be beat.

From The Reader's Viewpoint

Dear AIM,

I guess the only certainty in life is the certainty of change. So it is with me. After twenty plus years of career, a veritable lifetime of success in a highly technical area and learning all the myriad rules of a very bureaucratic, far-flung system, the time has come to move on. With budget cutbacks, promotion slow downs, and the "downsizing" in the wake of the Kuwait adventure, the time has come.

Paraphrasing the words of Paul Simon, "I guess my life of education hasn't hurt me...I can read the writing on the wall." The writing was clear and succinct. It said, "Get the hell out of here." I'm on my way out the door.

I haven't had to go looking for a job since 1972, when I got my draft notice. I've always known what to wear, how to wear it and how to interact with the people I meet in my profession. Now, I haven't a clue to what's going on. I can't even tell who's who by the ornaments on their shirts. It's scary.

I haven't moved since 1985, and I've never traveled with a horse before, much less two of them. I've never had to move my own stuff further than across town. And, I always knew that, when I got there, my paycheck would be waiting and I'd have something to do. It's just not that way anymore.

Oh, everything hasn't been sweet. Civilians seldom get shot at, get to shoot back even less, and almost never get *told* to stay in one place, get shot at and don't shoot back! Civilians get to choose their clothes, for the most part. And, they don't get in trouble if they forget some ornament, or wear the wrong socks or forget their hat. (Who wears a hat in America anymore?) Civilians almost never have to pick up cigarette butts in the dark, or spit shine a toilet at 2AM, or watch a friend get shot to death, mutilated or blown apart.

Part of the human condition is that we adapt. That may be why we run the planet, instead of the ants and cockroaches (although that is sometimes questionable). And I'm sure I'll adapt. It will be painful, and I'll make some mistakes, but I'll adapt.

So it is with computers. Time brings change, and change hurts. My old Mega, with all its cheats, add ons and adapters, just wasn't a challenge anymore. The software just wasn't there. It was too complicated and expensive to upgrade. And, it was just tooooo annoying to deal with the Hitler complex of our local dealership.

Here's an example. I go in and ask for a 2400 baud modem. "We don't have any and haven't had in months," I'm told. "We have some 9600's for X dollars." Well, says I, can you get me a 2400 baud modem? "Maybe, but does this show you what we think of 2400 baud modems?"

I think about it, and the next day I call back and tell them to forget it, I'll get the modem elsewhere and I don't like the way they treated me. "If you don't like it, then don't come back," I'm told. With support and service like this, is it any wonder Atari stays in last place?

The last six months I had the Mega, I ran strictly as a Mac, thanks to Spectre GCR from Gadgets by Small. The Mac environment is a "mature" version of GEM, loosely speaking. It is awesomely "user friendly," and it's simple to install and operate. It is the best compromise between Atari and MS-DOS I've seen.

There are more places to buy software and hardware (I can avoid the Hitlers and Goerings), and developers don't go out of business with the amazing rapidity Atari developers do. And the big developers don't drop Mac support because of lack of sales. Apple doesn't make hardware changes and then keep them secret.

So, I sold the Mega. I made the guy who bought it a good deal. Then, I bought a Mac. I'll miss the Atari. It did some great things, and it taught me a lot. But, the time has come to move on. Change rushes in on us and we all must change or perish.

I'll miss all the friends I made in Atariland—Tim, Bob, Steve, and Brian and his dad. But, a lot of my old friends are here in Macland—WordPerfect, Timeworks and others—sometimes under different names or logos, but still the same support.

Many ST people have gone to the Mac; maybe it's a logical progression. At any rate, good bye and God bless you all. Should you ever get back to God's country, give me a call. I promise I won't answer the phone in Spanish.

Dear AIM,

As spring approaches, and Atari Corp. has once again failed with many of their promises, I hear many of my friends talking about switching to IBM or some other computer....

IBM with all it glitz and glamour, seems to be the computer of the future. But is it really what anyone really needs?

Definitely *not!!!*

So many people get caught up in this keeping up with Joneses syndrome. Before you think about switching computers due to Atari's lack of customer support ask yourself a few simple questions, you may be very surprized at your answers.

What are *'my'* needs for a computer? Most people will choose either word processing or playing games.

Can an IBM do word processing better than your Atari? Certainly not! Can it play games better? Nope. Does your Atari do these things satisfactorily for you?

Yes, but... *But What?* But the IBM has so many new things coming out for it all the time.

Ah Ha!!! Now we have gotten down to the real bottom line, in why you are considering switching computers. The IBM has new stuff coming out all the time. If it wasn't for this fallback, you would be perfectly happy with your Atari, right?

Ok, now is the chance for you to make a difference, and make Atari know how you feel. Most all of us are in sincere agreement, that we love our Atari's, and would never switch if Atari would just start listening to our wishes.

The Solution:

Write to Atari Corp., Attention Jack Tramiel, Sam Tramiel, and Bob Brodie.

Send *each* of these three a copy of your letter, and tell them in no uncertain terms, that if they don't wish to lose all of their loyal Atarian following, they need to bolster their support in both hardware and software for both the 8-bit and ST line of computers. Tell them we are tired of waiting, and we want action *now!!!*

If each and every Atarian in this country would take the time to write to these guys, and tell them this, maybe we would start seeing the new releases here in the US instead of them all going overseas.

The time to act is now, and if *you* don't do it, then you are not a true Atarian. *Do it!* We can make a difference!

Write to these guys at:
Atari Computer Corp.

ATARI BULLETIN BOARD

Lexicor Recalls Software

Lexicor Software has recalled all copies of both Rosetta and Prism-Render being sold by RIO Computers. Lexicor alleges that RIO is selling illegitimate copies of these packages. If you purchased your copy of either package from RIO or the package has a "RIO" stamp on the disk or "RIO" appears in the "ABOUT" dialog, send your original diskette to Lexicor Software, ATTN: Rosetta/Prism-Render Recall, 58 Redwood Rd., Fair-Fax, CA 94930.

All recalled copies will be examined for authenticity. If the package is legal, it will be returned to you with a $25 coupon good towards any Lexicor product. If the copy is illegal, Lexicor will keep the package and send you a "legal courtesy copy" of the software and a choice of registering the software for full warrantee and upgradability or the $25 coupon. For more details, call Lexicor Software at (415) 453-0271.

64 Megs!

Gadgets by Small has confirmed that they are developing a 64 megabyte memory upgrade card for use with the SST 68030 accelerator. The board, which will plug directly into the SST's processor-direct slot, will give you access to a full 64 megabytes of system memory. The board will reportedly use standard one or four meg SIMMs and will act as "very fast, burst mode compatible" RAM! No price or shipping date was mentioned.

Warp 9 Ships

CodeHead Technologies (formerly CodeHead Software) has released Warp 9, the upgrade to Quick ST. Over three months of coding has gone into the update. Literally dozens of bugs and compatibility problems have been eradicated in Warp 9. It now works fine with FSM GDOS, and problems have been eliminated with Touch-Up, PageStream, and many other programs where redraw and other problems existed.

Additional features over Quick ST 3.0 include a built-in, customizable mouse accelerator and the ability to use function keys to select buttons in alert boxes. Warp 9 speeds up most processes anywhere from four to 12 times! Retail price is $44.95. Owners of any version of Quick ST or Turbo ST can purchase Warp 9 for only $20 by sending in their original disk. CodeHead Technologies, P.O. Box 74090, Los Angeles, CA 90004, (213) 386-5735 (Mon-Fri 9AM-1PM Pacific Time).

Gribnif News

Gribnif Software has released Convector Professional, an auto-tracing package that converts raster (bitmap) images to vector graphics. The package can load IMG, Degas, IFF, TIF, PCX, PIC, Arabesque, MegaPaint, NeoChrome and other bitmap graphic formats. Vector graphics can be saved in a variety of formats, including Arabesque, Calamus CVG, GEM, GEM/3, Encapsulated Postscript (EPS) and MegaPaint.

Convector also runs a desk accessory, allowing it to be used as an Arabesque module or to vectorize any GEM screen display. It can even be used as a MegaPaint module. The program includes special support for the vectorization of entire fonts and symbol tables, which can then be saved in individual vector files for easy importing into most popular font editors. Convector also generates single vector objects (as required by most font editors). Suggested retail is $149.95.

The Gribnifs have also brought Pure C to the North American market. Pure C is the latest version of Turbo C Professional, previously released by Borland Germany. The system includes an editor, compiler, linker and debugger. It works on all Atari ST and TT computers, fully supporting high resolution and extended color displays.

The ANSI standard compiler supports type checking and function prototyping. When an error is found during compiling, simply double-clicking on the error message places the cursor directly on the offending source code line. Libraries are included for the TT's math co-processor, FSM-GDOS support, and the Borland BGI Graphics Library for compatibility with PC programs.

The Assembler is five times faster than before, and supports local labels and longer symbol names. It can also generate code for all 680x0 processors, up to the 68040. It also generates code for the 68881 and 68882 FPUs. The Debugger is a full source level debugger with its own graphical environment.

It allows any number of windows to be open at once. Windows can include source code, variables, assembly, CPU/FPU registers, memory dumps, watched expressions and the system stack. Breakpoints can be configured for a variety of specialized situations. There's even a special "animation" mode, where you can watch the program execute one line at a time.

Pure C requires at least 1 megabyte of memory. Retail price is $275 US (with $7 s/h in US, $10 US in Canada). Turbo C owners can upgrade for only $175 plus shipping (must include original Turbo C master disks). Gribnif Software, PO Box 350, Hadley, MA 01035, (413) 584-7887.

Flash II Released

Missionware Software released Flash II at the Ace '92 show in Toronto. The long awaited "upgrade" to the most popular telecommunications package on the ST is finally available.

The package boasts full compatibility with Flash's old DO files, with the addition of many new scripting features for added flexibility. The software also supports up to 30 function keys, 10 of which are global and the other 20 specific to each system.

Flash II supports TTY, VIDTEX, VT52, ANSI, VT100, VT101, VT102, VT200, VT300 and Prestel modes. Built in file transfer protocols include ASCII, Xmodem, Ymodem, Ymodem-G, Zmodem, Modem7, WXModem, CIS B+, Kermit, SEAlink and Telesoftware (for Discovery/Prestel systems).

The type ahead buffer supports up to three lines of text which is fully editable using the cursor, delete and backspace keys. The Return and Enter keys perform different functions, depending on the configuration. One can be used to enter forced carriage returns into your message, while the other is used to send the message.

The 226-page manual includes a tutorial, detailed section on all functions of the program and a 50-page section explaining (with examples) the DO scripting language. Retail price is $49.95 US plus $4 shipping and handling. Upgrading from any old version of Flash is $30 plus $4 shipping. You must include your original Flash disk as proof of ownership (the disk will be returned to you). Missionware Software, 354 N. Winston Drive, Palatine, IL 60067-4132, (708) 359-9565.

MacRead

MacRead is a new utility from Goldlead Publishing that lets you read data files directly from a Macintosh formatted HFS hard disk or a Spectre formatted HFS floppy disk. You can then store these data files on an ST disk. HFS is Apple's current disk format, and is much faster and more flexible than the older MFS format.

MacRead lets you work with both Macintosh and ST/TT computers. Use your Macintosh (or Spectre emulator) to create your artwork or other files, then copy them to your ST/TT. Images, illustrations, text, data, PostScript files, and more can easily be read from a Mac disk for loading into an ST/TT software program. MacRead is available now for $49.95. Goldleaf Publishing, 700 Larkspur Landing Circle, Suite 199, Larkspur, CA 94939, 415/257-3515.

I-Koen Design News

I-Koen Design, publishers of Radical Type magazine, has moved from Canada to the US. Publication of Radical Type will continue after a two month break following the March/April '92 issue. Radical Type is the only magazine dedicated to Amiga and Atari publishing, with an emphasis on PageStream, ProPage and Saxon Publisher (the latter two being Amiga packages). Subscription rates for 1 year (6 issues) are $18.95 US ($24.95 US for foreign subscribers).

The I-Koen Design Guide to PageStream is available. The Guide contains reference charts for fill styles, halftone screens and other effects at 300 and 1200 DPI output. Help on writing macros is included, as are font samples, character set comparison charts and keyboard reference charts for graphic characters. The 20-page guide retails for only $6.95 US.

Finally, I-Koen has released Idea Forms One, a package of over 200 templates and forms for personal or small business use. The templates are divided into 11 design series, allowing you to maintain a uniform appearance over a range of documents.

Requires PageStream 2.1 or higher. Includes 3 disks and a 24-page manual. Retail price is $39.95 US. Contact M.LOADER1 on GEnie or look for Mike Loader in the Soft-Logik area in CompuServe's Atari Vendor Forum (GO ATARIVEN).

STacy Battery

DragonWare Software announced the Dragon Batter Kit, an internal battery for the STacy portable. The kit adds only 2.2 pounds to the STacy and includes a dealer-installed cable and jack and one 2.2 amphour battery. On a stock STacy, this gives over two hours of use on one charge.

The battery has a fast charge option that recharges the battery in about two to three-and-a-half hours *while* you use the computer. The Dragon Battery Kit has a suggested retail price of $94.95. DragonWare Software, PO Box 1719, Havre, MT 59501-1719, (406) 265-9609.

SilkWare

If you purchased a graphics tablet from EI/O or QMI and find your tablet no longer workes when you upgraded your TOS, SilkWare has just what you need. If you want to add a graphics tablet to your ST, SilkWare to the rescue again.

SilkWare has announced a pair of graphics tablet drivers for the ST. One driver supports the Mitsubishi tablet (as sold by QMI) and the other is for the Summagraphics tablet (which EI/O supported). Both drivers are "painstakingly TOS-legal," so as to work with all TOS versions, all processor speeds and all resolutions. Price, including shipping, is $29.95 for either driver. SilkWare, ATTN: Mark Slagell, PO Box 3260, Madison, WI 53704.

MIDI Maze for Lynx?

A recent reply to a letter in Video Games and Computer Entertainment indicated that while MIDI Maze was once under consideration for development on the Lynx, Atari's Entertainment division is not currently pursuing the idea. VG&CE magazine has proposed a letter writing campaign to help get Atari "off the fence."

If you would like to see MIDI Maze on the Lynx, write to Atari Entertainment, 330 N. Eisenhower Lane, Lombard, IL 60148.

If anyone asks, tell 'em you saw their ad in AIM!

Right on Target

David Plotkin
Contributing Editor

There is something of a "Catch 22" in becoming a new Atari dealer which may account for the lack of enthusiasm.

I was recently reading my copy of AtariUser, an ST Magazine that manages to do a pretty good job of covering events in the Atari world. In this particular issue, the staff of AtariUser had undertaken to identify all the Atari dealers in the US.

They had, after some negotiating, received from Atari a "highly confidential" nationwide list of about 1,000 dealers (I have to wonder why the list is confidential). They were initially encouraged by the numbers—1,000 dealers works out to at least one dealer in every major city. They were, however, suspicious, as we all have heard of large areas with no dealer and stories of having to drive five hours to the nearest Atari dealer.

They decided to try verifying that the list was accurate by phoning as many of the dealers as they could. Pretty soon, the awful truth began to dawn, and by the time they had worked their way through the list, it was as clear as a spring day.

After eliminating "dealers" who were no longer in business, dealers who may have at one time queried Atari on what it took to become a dealer, stationary stores that sold Atari brand calculators, a variety of stores that had nothing to do with computers, private residences who were not amused by the phone call and at least two empty lots, they had the numbers at last.

There were, by AtariUser's count, between 100 and 200 bonafide dealers. Think about that for a minute. That is between two and four dealers *per state.* A whole raft of states didn't have any dealers at all. When you realize that some cities have as many as three dealers, you can see that the "network" of Atari dealers is stretched pretty thin.

It doesn't take a rocket scientist to figure out that a computer you can't buy will never catch on. And remember, technically, you can't buy these computers by mail order—you have to go to a dealer. Kind of makes me sad.

The More Things Change...

The whole business of the number of dealers takes me back a few years. I don't remember the exact year, but it was about the time Atari decided to take its stock public. One of the things you have to do to meet the SEC's requirements for selling your company's stock is disclose a lot of information. This is so people deciding whether or not to buy the stock are well informed.

One of the things Atari had to disclose was the number of dealers they had selling their computers. As I recall, the number they published was about 1,000 (does this sound familiar?).

At that time, I was doing a column for STart magazine, probably the most widely read magazine for the ST until its demise in February of last year. The column detailed emulators—the Spectre GCR and several PC emulators, including Avant-Garde's pc-ditto were the primary focus of the column.

I did a lengthy interview with Bill Teal, president of Avant-Garde, and the results of that interview were published in my column. In the interview, Bill told me of an effort by several developers to try and figure out how many Atari dealers there were. Starting from a list of dealers provided by Atari, Bill and several others began phoning.

The results, as you have probably guessed by now, were significantly different from what Atari claimed. They found, at that time, about 250 dealers. This is what I published in my article.

Then the fun began. Apparently, someone at the SEC read STart (who would have guessed it—Atari owners turn up in the weirdest places). They compared the number in my column with the number in Atari's officially filed documents and had some very hard questions to ask of Atari.

I don't know how it all worked out, except, of course, that Atari was eventually able to satisfy the SEC, because Atari stock did go on sale. Needless to say, neither Bill Teal nor myself were particularly popular with Atari at that point!

That column happened to appear in the issue of STart that was sold at the World of Atari in April of that year. I was there—so I heard the whole story from Bill Teal firsthand.

It was also there that I happened to be sitting at breakfast in the Disneyland Hotel restaurant when Sig Hartmann (president of Atari Software then, and since retired) joined me at my table. He was very diplomatic and admitted that Atari did indeed need to straighten out the number of dealers they had. Sig didn't blame me for letting the cat out of the bag (which I didn't do with any malice toward Atari). But then, Sig always was a gentleman.

Dealer Drought

There is something of a "Catch-22" in becoming a new Atari dealer which may account for the lack of enthusiasm. For one thing, setting up a dealership takes considerable resources (time and money), as well as determination. If you intend to service the machines, you also need to find a qualified technician—they are scarce, I can tell you.

In order to stay in business, you need to sell machines and software—*a lot* of machines and software. Of course, this presupposes that a lot of machines and software are available to sell.

Software there is—powerful stuff, too. Much of the new stuff depends to a great extent on European manufacturers. Many of the overseas companies are not particularly interested in distributing in the US, even assuming they bother to translate their manuals into English. Fortunately, of course, we can use the British manuals (do you know what a "full stop" is?).

Machines are more problematic. Nothing I have seen Atari do has accounted for much increase in production, which was inadequate in the first place. The new machines are certainly impressive, especially the TT and the little STBook portable. But, Atari needs production quantities an order of magnitude greater than they are providing to really crack the market. In order to create that many machines, they are going to need new production facilities.

And even if Atari could produce the necessary quantities, they would need to get the word out. And they need four to five times the dealer base they have now. I don't see people flocking to sign up. I don't say its hopeless, but Atari just doesn't seem to be making much of a concerted effort. Changing officers and reorganizing every few months just doesn't cut it. They have to *do* something. As it is, I think the number of dealers will continue to shrink—and Atari computers will get ever-harder to find. I don't like it, but I don't see the situation changing anytime soon.

See you next month.

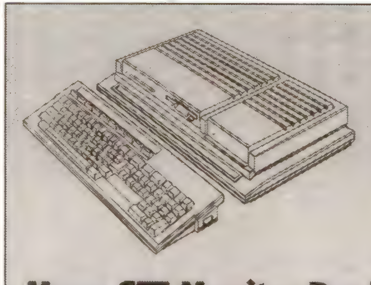
Megas & Monitors!



Mega STE Monitor Deals!

☛ We're hereby announcing a deal that will make your teeth sweat. Now, with the purchase of any Mega STE, in any memory or hard disk configuration, you can get a color or monochrome monitor at a substantial discount. And not only that, prices on the Megas have dropped anyway, so you can get a complete Mega STE system, with hard drive and monitor for the price you probably paid for your 1040ST system! Consider it. To upgrade your existing ST, you might have to spend as much as $1500 to get comparable RAM upgrades, accelerators, new TOS versions, hard drives, and detachable keyboards. For well under that price, you can get a brand new Mega STE, which includes all of those upgrades, not to mention the VME card slot (for expanded video) and Appletalk compatible network port. And it includes a monitor! Why don't you give your old ST to a friend or family member, or keep it as a spare. Remember, an upgraded ST is never as reliable as a new machine. Isn't it about time you stopped cramming things under the hood and thought about buying a new car? Now you can – *without feeling guilty!*

Mega STE Deals!

• **Mega STE** 1MB RAM	$849
• **Mega STE** 2MB RAM	$899
• **Mega STE** 4MB RAM	$989
• **50MB Hard Disk**	**$100**
• **1.44MB Drive**	**$139**
• **68881 Coprocessor**	**$99**
• **2 Year Warranty**	**$79**

Monitor Values!

Spring & Summer

☛ Winter is slowly but surely giving way to the warmth and raw flavor of spring, and our Spring/Summer catalog will be out very shortly. The Spring/Summer catalog will be our biggest and best printing effort yet! We're moving, too! A tremendously large location is being prepared for us now, and we should be in by Summer! We're not moving far, though — just across the street! Call for more information. Thanks for your continual support. We appreciate it.

NEW Little-Toad-20 Drive

☛ We've had numerous requests to create a drive suited for beginners and casual users. So we did. Now, you can get our Little-Toad-20 Drive. It features a high quality 20MB, 3.5" fast hard disk, in a portable, easy to handle case. Definitely one of our most popular 1992 introductions! Get yours TOADAY! At the tremendously low price of $299, it's a steal!

GET OUR CATALOG

☛ For our complete menu listing, be sure to call or write us to get a copy of our most recent catalog and to be placed onto our mailing list. No Atari connoisseur should be without our insightful reviews of hundreds of Atari products. Call us at Toad Computers TOADAY to get onto one of the most hip-hoppingest mailing lists around toaday! Get postcards, catalogs and more! All you have to do is call!

Haven't You Always Been Playing with Power?

(An Alternative ST Advertising Strategy)

Tim Holt
ACCEPT

Billy Bob and I were getting ready for the January meeting of ACCEPT, and we had a few minutes to kill before we went to the meeting. Did we discuss computers? Did he tell me all about the latest news in the Mac world? No, we did what any true Atari computer enthusiast would do with some time to kill on a Saturday afternoon—we watched American Gladiators. Now, I don't know if you are familiar with American Gladiators, but it is basically a step above Championship Wrestling and a notch below MTV on the old intellectual meter scale.

We sat there, waiting for ICE—a woman who obviously started taking steroids as a child—to do battle with some poor moron the producers had taken off the street.

Right as I was finishing the last of my Peanut Butter Fudge Sundae ice cream, Larry Czonka, former has-been in the NFL, let us know what was coming up: "In a few minutes, Ice, who broke her ankle in the Balls of Death competition just five minutes ago, has made an amazing recovery and will take on Mildred Johnson, a mother of five and part-time rodeo bull rider, in the Nintendo Wall of Doom."

"By the way," Larry went on to tell us, "the Wall of Doom is sponsored by *Nintendo. Nintendo,* now your playing with *power!!*" And so it went. Ice was able to catch up with Mildred, even though Mildred has a good 30 second lead, and Ice threw her off the Nintendo Wall of Doom.

Throughout the show, there was a barrage of Nintendo this; Nintendo that; the Nintendo halftime score; the Nintendo interview with Moose, the American Gladiator from the Yukon who had no body hair; and so on.

Billy Bob and I looked at each other. Every commercial for Nintendo was pretty much the same. Now, you have 16-bit power! Now you have *stereo* sound! Now you have 3D graphics. *Wow!* (Being a school teacher, I can tell you that most kids—and that is who this was aimed at—have absolutely no idea what 16-bit anything is. Half might figure out 3D graphics and I'll guess 60% get the stereo sound part right.)

Billy Bob looked at me. "Isn't that what we have had for the last 6 years?"

"Yep. Sure have. But these kids, looking at these commercials think that 16-bit power, stereo sound and 3D graphics were invented by a little old Japanese guy named Mr. Nintendo."

Commercials for the *Sega* this and the *NEC* that were on the second portion of American Gladiators. (Apparently, the producers haven't heard of the concept of product loyalty, and pretty much take any commercial. Who cares if they are for competing companies?)

We saw the Sega "At Home with the Gladiators" and the NEC "Win a Date with the Gladiator of Your Choice" essay contest (Dear Moose, I would love to date you because I never met a man whose pecs were four times my bust size. Love, Jenny.)

Then, they trotted out the *newest* Nintendo offerings. Hmm. SIM City, F-16 Flight Simulator, Golf, Championship Chess. We've been playing those games for years! And, from the looks of the graphics, I would say the ST versions beat those *Super* Nintendo versions by a mile.

Which leads me to my thesis: Why doesn't someone advertise the ST to these kids who are buying up these Nintendo systems like they are manna from heaven?

I know. We've been trying to get out of the game machine image for years now. And I think that, by and large, those that are still buying STs are not buying them because they are game machines.

But, our numbers are shrinking. It's about time, and I never thought I would say this, that we swallow our pride and just say "Look, this *is* a great game machine! It kicks Nintendo's butt!"

Any game on Nintendo looks 1000 times better on an Atari STe. C'mon kid, get your tush over here and play Falcon for a few minutes. Ever see that on Nintendo? Noooooo! Mig 29? Kick your little fanny, bub. And it's got, get this kid, 16-bits! Stereo sound! 3D graphics! And you can even use the darn thing to do your homework on if you wanted to. Can't do that on a Nintendo. See that Nintendo hooked up to an electronic piano over there? Come look at this Atari ST. It's hooked up to an entire orchestra! Let's see your Super Nintendo do that.

Why do I recommend selling our beloved Ataris as game systems? Well, actually, there are several reasons:

The user base is shrinking. We simply cannot rely on DTPers and musicians to keep our computer alive. *It doesn't matter who is buying the machine, as long as someone is buying it!* We could have alien technology super computers the size of a wristwatch, but if no one buys them, what good is it? Thirteen-year-old kids buying $600 system are just as good to the bottom line as 55-year-old business types.

David Plotkin, in the January AIM, stated "Atari needs to get more machines sold and build their user base or 1992 may be the end of it." I know you hear that every year, but someday, those gloom and doom guys just might be right. Selling to the "Game Crowd" is just as good as selling to the Music or DTP crowd.

"Well, someone buying a machine for Desktop Publishing will spend more money," you might say. Wrong-o. A person that buys a computer to do a specific task, say Desktop Publishing, may have an initially larger investment than a family that might buy the computer for entertainment.

However, once the DTP guys buy the system and the program or two that goes with it, they are through. No more investment. Billy and his friends, however, will continue to purchase the latest software as soon as it comes out. How many families do you know of that have a Nintendo with a zillion cartridges? I know a family that was robbed, and the bandits took off with over $2500 in Nintendo games!

Large game sales make other companies look at the market. Don't you think the computer software wizards have tried to figure out ways to get into Nintendo's market? Why? Because of the kids? No, because they have seen the number of systems out there!

If some company sold 500,000 copies of a game for the Atari, don't you think companies like WordPerfect and Spectrum Holobyte and Broderbund might take notice? *Who cares* if it was a game that sold? Five hundred thousand copies means that there are at least 500,000 machines that can run that game! Get it? Five hundred thousand potential WordPerfect, Carmen San Diego or MS Works users! Money talks. Numbers talk.

Games, er, entertainment software is no longer looked at as the stepchild of computers. All those folks with their Messy-DOS systems can't wait to get super VGA graphics. Why? Not because WordPerfect looks better in VGA. It's because all those new games require VGA or Super VGA graphics. IBMers are buying *games.* Millions of games! IBM clones have become *the* game machines! Why? Because they now have graphics that are *catching up with* the Atari world.

Games now have credibility, simply because of the numbers in the MS-DOS world. Atari is no longer the game machine. All those clones out there are the true game machines, and as such, have given the term "Electronic Game" new respectability.

So what if people call Atari a "Game Machine"? If we can use that image to sell Atari's, then USE it!

Game Machine!
Game Machine!
Game Machine!

Imagine this commercial, during a break in American Gladiators:

A little kid playing a game on his Super Nintendo. He shows his friend his "latest game". His friend tells him "I finished that game last year."

"Well, what about this game, it just came out last week?"

"I finished that game three months ago."

"Three months ago? It just came out for the Nintendo."

"That game came out two years ago for my Atari ST."

"I didn't know that."

"And the Atari had 16-bits, stereo sound and 3D graphics even before Nintendo was a company in America. Besides, my dad uses our Atari for business, and Mom does all the house stuff on it...when I let them use it."

"Gee, you can't do that on a Nintendo."

Fade out to black. Then the screen shows the Atari STe and MegaSTe computers. Fade again. The Atari logo comes on, and the voice over says "Atari: We've always been playing with the power."

Game machine? Yeah.

Rasters and Vectors

A Review of

Arabesque MegaPaint Silhouette

Bill Rayl

Drawing programs that handle both vector and raster graphics are one of the newest, and most important, types of graphics software to be released for the Atari ST.

These graphic creation packages are invaluable to desktop publishers and graphic artists. Along with auto-tracing programs—which automatically convert raster graphics to vector formats—raster/vector drawing programs are an essential part of any complete DTP platform.

This article looks at the three best packages in this category. Arabesque Professional is produced by Shift GmbH and marketed in North America by Gribnif Software. MegaPaint II Professional from Tommy Software (also in Germany) is marketed by CodeHead Technologies. The only "made in America" entry is Silhouette from Maxwell CPU of Louisville, Colorado.

All these packages are *monochrome only* drawing packages, although you can colorize vector images from within your favorite DTP package.

Measure DIN 406 (diameter)____

Each of these packages have a lot in common, and for general illustration purposes you would most likely be happy with any one of them. However, each package does have specific functions and features that the others do not. Depending on your needs, these extras may tip the balance.

Rasters versus Vectors

Before getting into the specific virtues of each program, it's important that you understand the difference between a raster and a vector graphic.

Raster graphics are made up of many tiny *pixels*. Drawing a raster graphic is, in actuality, drawn pixel by pixel—if you use a circle tool in a raster drawing program, the computer places the pixels appropriately, but it does so one pixel at a time. Modifying these graphics is, as you might expect, also done pixel by pixel. Raster graphics are also often referred to as bitmap graphics.

Most paint programs you are familiar with—such as DEGAS, Suerat or Prism Paint—are *raster* graphics drawing programs. Scanning/drawing programs such as Touch Up and MultiViewer Graphica are also raster packages.

For professional DTP work, raster images have a number of limitations. The most noticeable of these is that raster graphics tend to become "jaggy" when enlarged beyond a certain point. Also, fill patterns contained in raster images change as the graphic is resized, often causing unwanted "moire" patterns. Finally, scanned images of 300 DPI or higher, which are necessary for quality output, can take up enormous amounts of disk space and memory when loaded into DTP packages.

Vector graphics are geometric shapes made up of mathematical points and calculations. With various drawing tools, you can create anything from a simple line to very complicated polygons.

Editing these graphic objects is done by modifying specific points. For instance, look at a simple line. As a vector graphic, a line is made up of a starting point and an ending point (plus information on the width and length of the line, fill pattern used, etc.). To modify the direction or length of the line, you would, for instance, select the ending point and drag it to the new location. Once you set the point, the line would redraw. If you're familiar with the way lines are drawn in DTP packages like Calamus or PageStream, those are vector graphics.

The very first vector graphics drawing package for the ST was Migraph's Easy Draw, which saved in the popular .GEM format. Since then, other packages have appeared, most notably Calamus Outline Art from ISD, which supports the .CVG (Calamus Vector Graphics) format.

The benefits of vector graphics for DTP work have nearly a one-to-one correlation to the drawbacks of rasters. Vector graphics do not lose any of their quality when resized, their fill patterns remain unchanged and they usually take up considerably less memory than an equivalent raster image.

Vectors also have the additional benefit of being far easier to edit and manipulate. Since a graphic can be produced from many independent pieces and these pieces can be layered, drawings can become quite complex and detailed.

Now That That's Over...

Arabesque, MegaPaint and Silhouette all have the "standard" features you would expect to find in a drawing package. These include tools such as flood fill and spray can, as well as cut and paste functions. Anyone who has used any paint program is already familiar with basic drawing tools.

This article won't dwell on those. Instead, we'll discuss some of the similarities of the packages (and differences) in such areas as file format support, printing and text capabilities. Then, we'll take a look at the unique features of each program.

While the user interfaces for each package are somewhat different, it is quite easy to switch from one to the other without any trouble. This is, in part, because these three programs all attempt to make the drawing process as intuitive as possible.

Arabesque's interface is via a toolbox containing icons, with keyboard equivalents for every available option. Silhouette also has a toolbox for selecting drawing tools, but drop down menus are used for option and mode settings. MegaPaint has extensive use of both drop down menus and an icon toolbox, and you can even customize the toolbox to your own needs.

Of course, Silhouette and MegaPaint also have keyboard equivalents for many features. But neither comes close to Arabesque, which lists seven pages of hotkeys in the manual!

The raster and vector graphics drawing modes are separate from one another in all the programs. You switch from one mode to another via a drop down menu option, keypress or whatever. In Silhouette, the exact same tools are available in both modes. Arabesque and MegaPaint have some different options depending on the drawing mode.

File Formats

One important consideration that has nothing whatsoever to do with the drawing capabilities of these packages is what kinds of graphics can they import and export (load and save).

Arabesque supports the most file formats, allowing you to load and save IMG, Degas, IFF, Neochrome, Doodle, Art Director, STAD and StarPainter ST raster graphics and GEM/3 and Calamus CVG vector images. Arabesque also has its own special bitmap (.ABM) and vector (.AOB) formats.

MegaPaint allows loading and saving of IMG, Degas, STAD and raw 32K screen image formats, as well as the popular PCX format from the IBM world. With external modules (available free from CodeHead), you can also load Degas Elite, TNY and CVG formats. MegaPaint also has load and save options for its own raster .BL? format (.BLD or .BL1, .BL2, etc. for "subdivided" images).

On the vector side, MegaPaint is the least flexible of the three packages we're looking at, loading only its own proprietary .VEK format and saving only VEK or CVG formats. The CodeHeads do promise future support of other formats via external modules.

Silhouette's raster support includes the loading of IMG, Degas, Degas Elite, Tiny and MacPaint graphics. A grayed out TIFF button indicates this scanned image standard will soon be supported as well. When saving a raster, the only supported format is IMG.

The only choices for loading vector graphics in Silhouette are GEM format and Silhouette's own .SGF format. However, when it comes to supported vector formats for saving, Silhouette beats both Arabesque and MegaPaint. Support includes GEM and GEM/3, EPS (Encapsulated PostScript, Illustrator compatible), and DXF format for loading into CAD programs like DynaCADD or AutoCAD on the IBM. A grayed out button here indicates Calamus CVG format is also coming.

For users of PageStream (or other PostScript systems), Silhouette's EPS support is an important consideration. Now, the graphics saved

Spirals in Silhouette

are imported into PageStream only as ASCII EPS (the picture doesn't show and can't be manipulated inside PageStream). Tim Reyes, Silhouette's author, says full "Illustrator 2.0 compatibility" for the EPS files is a high priority.

While Calamus (pre SL) owners can use GEM format graphics, the CVG format is far superior. Hence, Silhouette's current lack of that format is a detriment, while both MegaPaint and Arabesque score a plus in this category. The new Calamus SL supports the newer GEM/3 format, making Arabesque and Silhouette attractive options.

3D OBJECTS MADE EASY
IN ARABESQUE

Finally, MegaPaint's support of the PCX format is very important to anyone dealing with graphics coming from the IBM world. Nearly all scanning packages on the IBM have PCX support, as do many IBM-based drawing packages.

Text Support

All three packages have text support that is above and beyond what you might expect in a drawing package. MegaPaint comes with the Helvetica font in 18, 24, 30 and 36 point sizes and has a built-in standard text font besides. A separate utility bundled with MegaPaint allows conversion of Signum fonts from the popular German-based product. Fonts can be used in both raster and vector modes. Up to eight external fonts can be loaded.

Arabesque also comes with a utility for converting Signum fonts to its font format. Fonts that ship with the package are Courier (9, 24 and 30 pt.), Micro (30 pt.) and Roman (9, 24 and 30 pt.). Not counting the built-in System font, you can have up to five external fonts loaded. If you have and use GDOS (not supplied with Arabesque), you can use those fonts at various point sizes. GDOS fonts are not, however, usable in vector mode.

Silhouette's text support is entirely via GDOS, which is supplied with the package. Both Font GDOS and the newer FSM-GDOS are supported (only Font GDOS is supplied). The package comes with Swiss, Dutch and Typewriter fonts, and multiple point sizes from six to 72 point are available with Font GDOS. These GDOS fonts can be used in both raster and vector modes.

Printer Support

While usually not a very important consideration for DTP users, graphic artists often like to have the ability to get hardcopy results directly from their drawing packages.

While Silhouette does not have a built-in printing option, a companion program called OUTPUT uses the GDOS output driver indicated in your ASSIGN.SYS file. Using the OUTPUT program, you can get printouts of your graphics, but you must exit from Silhouette to run OUTPUT. Silhouette only comes with an Epson FX-80 compatible GDOS driver. Drivers are available from other sources for Atari and HP lasers, and FSM-GDOS comes with a host of printer drivers.

The printing options of Arabesque and MegaPaint are much more extensive. Arabesque comes with printer drivers for the Atari laser, HP laser, Cannon Bubblejet and various 9-pin and 24-pin dot matrix printers. A section of the manual details how to build your own printer driver.

Arabesque's built-in print option allows printing of multiple copies. You can print the whole page, just what appears in the screen area or only a selected area. Portrait or Landscape (sideways) printing and opt to print the graphic at full or half size.

MegaPaint ships with drivers for Atari laser; HP LaserJet II, III and IIID; HP DeskJet and DeskJet Plus; and various 9-pin and 24-pin printers (including a specific driver for Panasonic KX-P series printers). MegaPaint even has color support for printers such as the Star LC10 and NEC P6+. Up to four colors can be printed at one time, one for each "plane" that makes up a picture in MegaPaint. These planes can be thought of as separate layers, similar to an architectural blueprint. MegaPaint also offers the ability to create and save your own custom printer drivers.

Actual printing options in MegaPaint are quite similar to those in Arabesque. You can print the full page or just a section, Portrait and Landscape modes are supported and multiple copies can be printed. MegaPaint does have the added option of printing multiple copies of up to 16 different graphics. (Note: You can't print multiple pictures and use MegaPaint's color printing option at the same time.)

Manuals

The manuals that ship with each package are, by and large, excellent. At 88 pages, the Silhouette manual is the smallest of the three. It does, however, cover all the program's features quite nicely. The only complaint with the Silhouette manual is the lack of an index.

The MegaPaint manual is, at once, the best and the worst of the manuals. It contains far more detailed description of the program's functions and contains a wealth of extra information. It does suffer from one flaw, though. The translation from German to English left this manual with some rather awkward sentences.

At times, it seems the translator had to make a choice between words with very different meanings... and s/he sometimes made the wrong choice. The translation was obviously done by someone who used English as a second language. (Of course, his/her English is far better than my German!)

Here's an example. On page 101 when introducing the topic of scanners, the manual states "MegaPaint disposes of a variable scanner interface." The actual German word for *to dispose* that was probably in the original is *einrichten,* which also translates to *constitutes* or *establishes.* To say that Megapaint "establishes a variable scanner interface" is probably closer to what was meant. What it boils down to is that "MegaPaint can interface with a number of scanners."

Thankfully, these mental exercises are not too strenuous; I have yet to find any phrases that are so convoluted as to totally lose the reader. There are a few times when you'll have to do a double take, though.

The English version of the Arabesque manual was written by Gribnif's Rick Flashman here in the US. Hence, it does not suffer from a translation problem. In fact, I can find no fault with the Arabesque manual whatsoever. It has a good index and the chapters are organized in a logical fashion.

Arabesque

Well, we've probably dealt enough with the similarities between these packages. Now, it's time to get to the real interesting part—the features and capabilities that each program boasts. We'll start with Arabesque.

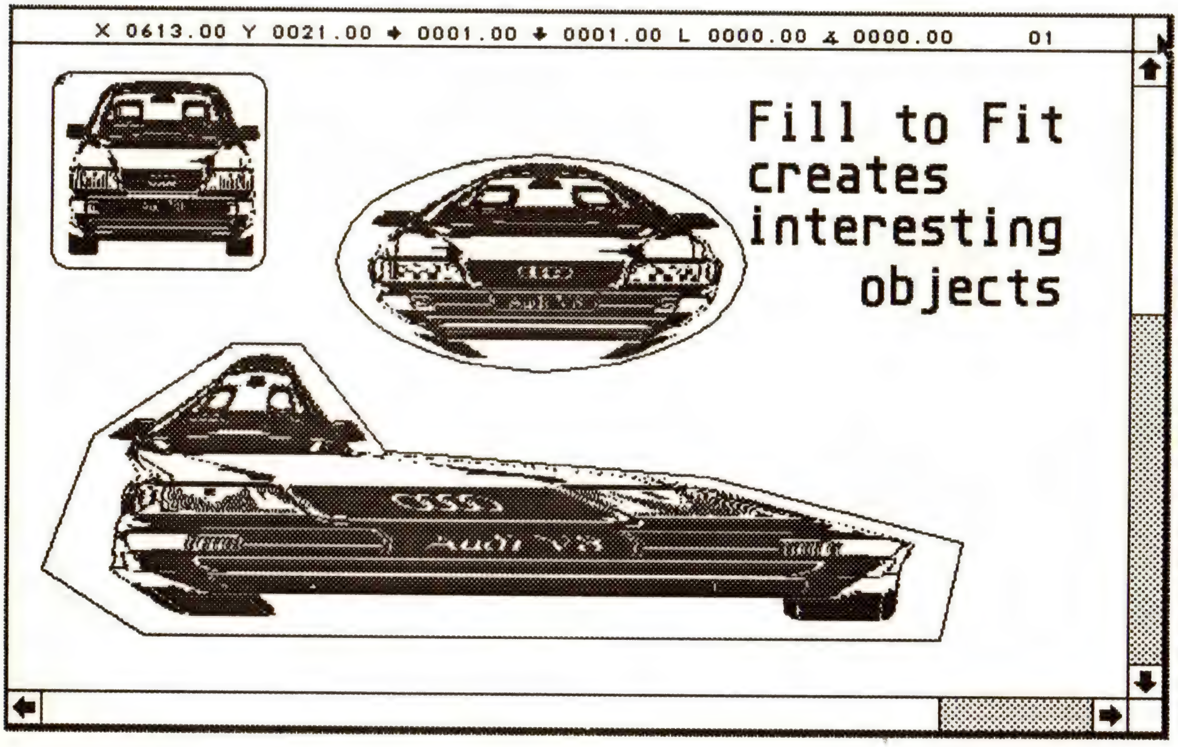
The most impressive feature Arabesque has that the others don't is a Buffer Fill to Fit option. Once you have copied some graphic to the buffer, Arabesque gives you many manipulation options for that graphic. The most striking is the ability to use the buffer as a fill. The Fill to Fit option actually stretches or skews or otherwise contorts the buffer's content to fill whatever object you choose. The results of such a tool can be seen in the example where an Audi has been used to fill various polygons.

Another nice fill option is that Arabesque supports gradient fills—automatic gradation from black to white. While not very sophisticated—you cannot specify gray scale percentages, increments or starting and ending values—it is nonetheless a welcome addition that is sadly lacking in most ST drawing packages.

Nearly as impressive as Fill to Fit is Arabesque's ability to generate 2D or 3D polygons. Drawing 3D polygons is as simple as drawing the polygon, with the extra step of adding depth to the object by moving the mouse. The results are excellent. A special "conic" option draws the endpoints of all lines into a single point, making it easy to create "zoom boxes" or other fading effects.

Arabesque's extensive block operations include such items as Contour, Smooth, Bend and Pull. Contour drops out the filled part of a block, leaving only the outline. Smooth is a wonderful option that lessens the jaggies that occur when enlarging bitmap images.

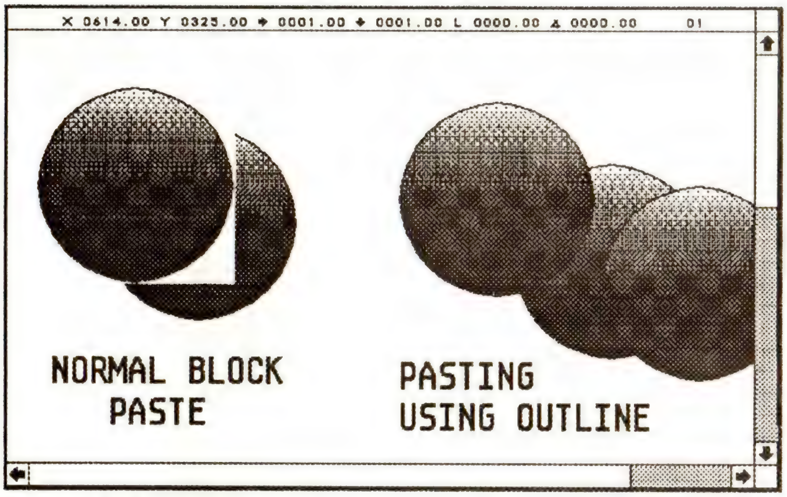
Bend allows you to bend or distort a block, with the option of Linear, Arbitrary, Ellipse or Sinusoid bending path. The Pull option lets you select the corners of the block and stretch them independently from one another.



X 0613.00 Y 0021.00 → 0001.00 ↓ 0001.00 L 0000.00 ∡ 0000.00 01

Fill to Fit creates interesting objects

Pasting of irregularly shaped bitmap blocks on top of one another in most paint programs includes pasting part of the background as well. Arabesque has a special masking procedure that allows you to paste objects according to the outline. If you've ever pasted objects on top of other objects and then



X 0614.00 Y 0325.00 ◆ 0001.00 ◆ 0001.00 L 0000.00 ∆ 0000.00 01
NORMAL BLOCK PASTE
PASTING USING OUTLINE

had to do lots of cleanup of individual pixels, you'll find this capability extremely important. (See the example graphic screen comparing a normal block paste to Arabesque's irregular paste option.)

The final unique feature we'll touch on here is that Arabesque can actually combine raster and vector graphics into one picture. Unfortunately, you can only save these combined graphics in Arabesque's own internal file format. That format is not supported by any other programs at this time.

MegaPaint

MegaPaint has a number of very interesting capabilities not found in the other packages. The first of which is direct scanner support. The package comes with built-in support for the Hawk CP14 and Print-Technik Universal or Professional scanners. With the ScanLite module (free from CodeHeads) and ScanLite from Wiz Works, nearly every hand scanner on the market can be used to directly scan into MegaPaint.

A number of MegaPaint's features make the package very suitable to technical illustration. A "measure" feature allows you to insert a line or arrow along with a textual measurement of distance, radius, angle, diameter or arc length. The use of up to four "planes" lets you create multi-level drawings, similar to floor plans and blueprints. There is even an option to show the planes at varying intensities, which is perfect for technical drafting or animation work.

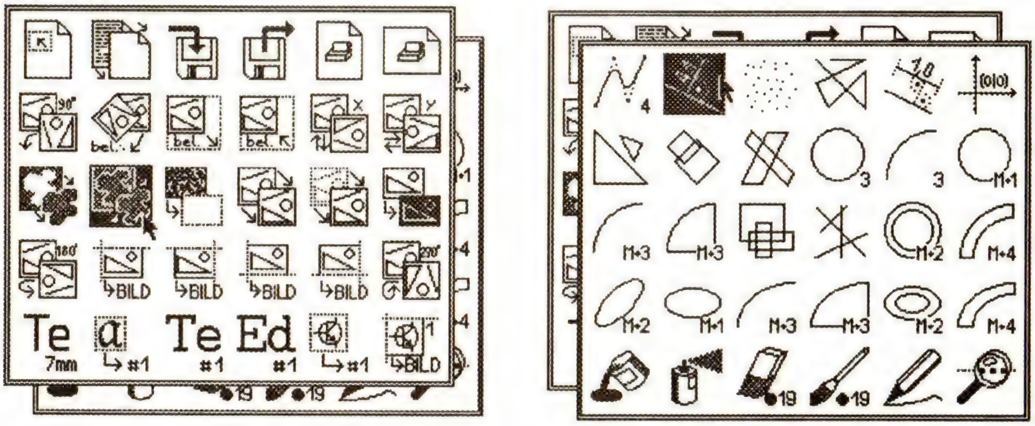
MegaPaint also supports "symbols libraries" and comes with two raster libraries of electronic symbols and two vector libraries of text objects.

MegaPaint has, by far, the most built-in object drawing tools of any ST paint program on the market. The Objects drop down menu has over 20 entries, including Point, Line, Triangle, Rectangle, Rhomboid, Parallelogram, Polyeder, Circle and Ellipse Rings, just to name a few. While you can create many of these objects in the other packages, MegaPaint makes it a snap.

The external modules support in MegaPaint has already been mentioned a couple times. While Arabesque supports the "GEM pipeline" for possible future enhancements via desk accessories, MegaPaint has a number of add-ons already available. Many of these available external modules from the CodeHeads have been released on the online services. And the CodeHeads promise there are more to come.

While all these programs have fill pattern support, MegaPaint is shipped with some custom fill patterns. The *pinprint* patterns are specially designed for dot matrix output up to 240 DPI, while *laser* is optimized for 300 DPI and higher output. There are also special fills containing 32 gray scales, 32 coarse gray rasters and 32 hatching patterns.

Probably the very last thing you would expect to find in a paint program is built-in database and mail merge capability. Well, MegaPaint has it! You can actually create graphic-oriented form letters and use a mailing list to do a mail merge from within MegaPaint. The software directly supports Adimens, dBase and Lotus 1-2-3 compatible lists, as well as gives you the option to define your own import format. I tested this feature using an address list exported from SuperBase and it performed flawlessly. Simply amazing. What will they think of next?



MegaPaint's Customizable Toolbox

Silhouette

As of version 1.36, Silhouette has matured into one of the premier graphics packages available on the ST. With version 1.5 scheduled for release in early May, the package promises to be even more stable and more powerful.

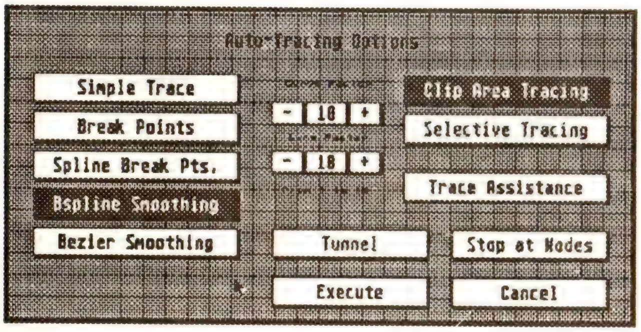
Probably the biggest feature unique to Silhouette is its built-in auto-tracing capability. Auto-tracing is pretty much what the name implies—the automatic tracing of a raster graphic, creating a new vector graphic in the process.

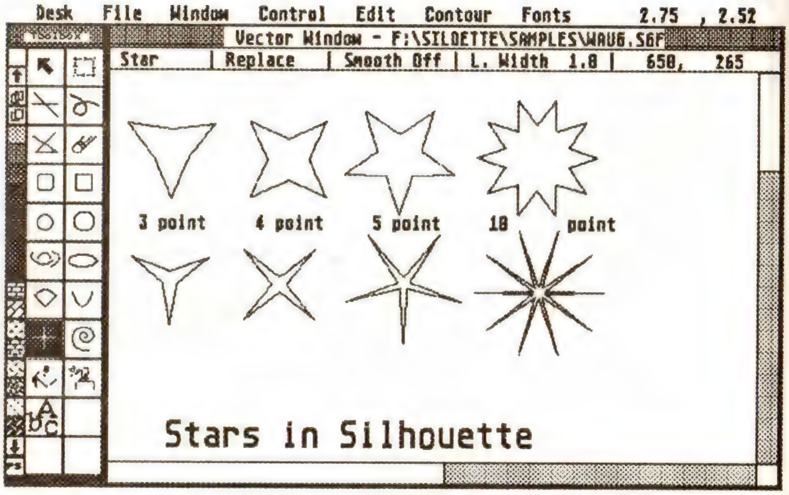
While the more sophisticated stand-alone packages like CodeHead's Avant Vector or Gribnif's Convector are far more powerful, Silhouette's auto-tracing features may be all the average user ever needs. Silhouette performs extremely well with tracing straight black and white images with little or no gray scales. Complex graphics with lots of fill patterns are far less successful and usually require some clean up work to get the desired results.

I have personally had quite a bit of success using Silhouette to auto-trace Degas and MacPaint black and white clip art. Options range from a simple trace up to tracing using Bezier curves, and numerous other smoothing and tracing settings complement the process. You often get very good results when mixing different tracing options for different parts of an image.

Another very nice feature, primarily because of its powerful implementation, is the Duplicate option. Selecting Duplicate brings up a dialog box crammed full of options. You can, for instance, duplicate an object 100 times. With each duplication, you can rotate the object by degrees, increase/decrease the object's height and width and apply an incremental gray scale all at the same time.

You can select Free Style, Radial Offset or Cartesian Offset duplication. With the Cartesian setting, you supply the actual X and Y offsets. Radial Offset presents you with an arrow. By increasing or decreasing the length of the arrow (as well as the angle from origin), you determine how loosely or tightly the duplicate are packed. Free Style creates as many duplicates as there are points in a "polyline" that you create. Basically, with Free Style, you determine the exact path for the duplication. Experimenting with the options available here is highly recommended. You can create some spectacular corkscrew or spiraling effects with this feature.





Star | Replace | Smooth Off | L. Width 1.8 | 658, 265

Two of the other impressive tools found in Silhouette are the Star and Spiral drawing tools. Using the Star tool, you can create star-shaped objects (or other polygons) with anywhere from three to 99 points. Pressing the left and right arrow (cursor) keys modifies the star's inner radius.

The Spiral tool is one of the cleverest drawing tools I've ever seen. It's like having a Spirograph on your computer! The more spirals you add, the more complicated the object becomes. You control the "pitch" (tightness) and "roll" of the spiral. When the spiral is ready to be set, you have the option of setting the spiral exactly as shown on screen or allowing Silhouette to complete the drawing process as would occur on a Spirograph.

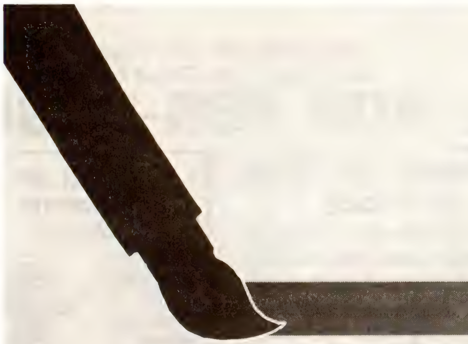
Observations

As you can see, each of these programs has a lot to recommend them. In using all three packages, there are some general observations I can make that may help you choose the one that's right for you. First, if you're looking for basic drawing capability, you will be happy with any of these packages.

As a generalization, I would say the following: Arabesque is the strongest raster drawing package of the three. Silhouette is the best on the vector drawing side, offering some powerful tools and more file formats. MegaPaint is the most balanced of the three, handling raster and vector drawing equally well.

For technical illustration and/or direct scanning support, MegaPaint is the clear choice. If converting of raster images to vector formats is important to you, Silhouette's auto-tracing options are far better than doing it by hand in the other packages. For creation of 3D images with depth and texture, Arabesque has the tools to do the job most efficiently.

Unless you've made up your mind which package best suits your needs by now, making a decision is going to be tough. Personally, I'm glad I have all three packages and don't have to make such a hard choice. If you can afford that option, I heartily recommend it as each package offers some very useful options the others don't.



Arabesque™
PROFESSIONAL

Illustration made easy!

Arabesque Professional is a complete Bitmap and Vector based illustration program. It allows you to create, import, edit, and save graphics in the two standard computer formats, Bitmap and Vector.

VECTOR
STOP

Features include:

- Easy to use, icon-driven, pop-up menus.
- Edit up to 20 drawing pages in memory.
- Draw points, lines, Bézier polygons, B-splines, circles, ellipses, arcs, 2D/3D, and rectangles (with or without rounded corners) in Bitmap or Vector mode.
- Choose from various line end styles, thicknesses, drawing modes, etc.
- 108 different fill patterns, edit your own or use an image block.
- Block operations (rectangle or arbitrary shape) including: cut, paste, mirror, rotate, bend, increase contrast, contour, smooth, enlarge, save and load.
- Outputs to 9- and 24-pin dot matrix, "Bubblejet", as well as Atari and HP laser printers.
- All functions operate rapidly in magnification mode.
- A complete UNDO feature.
- Load and save various graphic types including IMG, IFF, Degas, NeoChrome, Doodle, Calamus CVG, GEM/3 and Arabeque's own compressed formats.
- Configurable "spray can" feature.
- Complete selection of drawing modes, including: replace, XOR, AND, transparent, reverse, and more.
- Easily convert Vector graphics to Bitmap graphics, with optional use of gray scales.
- Fully illustrated manual.

Arabesque is also a program with an incredible amount of attention to detail. Its speed will amaze you, while its ease of use will astound you!

Arabesque is compatible with all Atari computers. It supports large display screens, like the Moniterm. Requires at least 1 megabyte of RAM and a monochrome monitor.

SHAREWARE SHARE-PAY

DALE WOOSTER

NWPAC

Share-Pay is part of my personal campaign to keep the Atari 8-bit computer alive, but it will also work for *any* computer groups.

Share-Pay is designed to help computer user groups everywhere in the world *support our shareware authors* and let them know we want them to continue writing new programs and improving the existing ones.

I will list just a few authors here to remind all you readers out there just how important these people and their programs are to our 8-bit world of computers—Ronnie Richie, Bob Puff, Roy Goldman, J.D. Potter, Don Davis, John McGowan. I could go on and on with hundreds of others. Just the few mentioned here have given us dozens of programs, including TextPro, MyDOS, BobTerm, Discomm, SuperARC/UNARC, Daisy Dot, and APACView.

Well, you get the idea. Without these folks, and others just like them, you really would have "just a game machine." I only hope each person that reads this can truly say that they have supported these authors by sending a donation after using (and continuing to use) their programs.

But, as president of NWPAC (North West Phoenix Atari Connection), I conducted my own small survey just to see how many members had sent in donations to various authors. I am ashamed to say I will not reveal the results.

That is one of the reasons I am proposing that *all clubs* take action to correct this problem *now* before we lose more of our fine software writers.

My proposal, put before the NWPAC membership, includes the following:

1. Raise the price on *all shareware disks* to members by $1 or $2 and keep records of each sale. Set aside the $1 (or $2 depending on what is voted in). Every 90 days, tally up the totals and mail a check to each author involved.

2. Suggest to every person who buys a disk or anyone that's using the program now that they send whatever they can afford right away—$5.00, $10.00 or even $20.00.

3. Include a *nice* Thank You note and advise the author what you liked or did not like about their program and that you would like to see more from them in the future.

4. I also propose that the club will totally support AIM and also include the club's AIM disk sales in this Share-Pay.

I am submitting this article to Atari Interface in the hopes that they will print it. I also hope they would be willing to become the "hub" for Share-Pay by printing author's addresses, etc. on a monthly basis, just like they do for the clubs.

I have never been "published" before except in newsletters, so I do hope you are reading this in AIM. No matter how or where you got this article, *please* distribute it to *any* BBS and in your own club newsletter and/or send copies where ever you think it will do some good. Do your part to keep the 8-bit alive and well!

Thank you for your support.

By the way, I am a registered owner of SuperDOS, TextPro and other programs, so I do practice what I preach. Please feel free to contact me and let me know how this works for your club. Our club BBS is PAUGS, (602) 278-8505, 24 hrs.

TECNO NINJA
AN 8-bit GAME FROM SOFTWARE INFINITY

Ed Hall
AAAUA

Tecno Ninja is one of the new KE-Soft games imported from Germany by Software Infinity. While most of the offerings in this line are strategy games, Tecno Ninja is a futuristic action-adventure.

Its premise hawks up some rather lugubrious, hopefully tongue-in-cheek names. *Tecno* Ninjas (untroubled by the missing "H" in their names) live on the planet *Trivator.* One day, the magic stone of *Sassafras* is stolen, and the warrior *Garagon* must travel to *Sarcendor* to recover it. Luckily he has his, um, *Vaginator Shield* to protect him. Really.

There are 10 scenarios to puzzle through—an old temple, a lost city, an underground lake, an alien spacecraft, a crystal cave and others. Each has 10 screens, and your Tecno Ninja must find an eye-shaped stone before he can advance to the next level. The screens are interconnected in various ways, but since there are only 10 per level, mapping is not necessary.

The play-action resembles a maze-and-platform game with the emphasis not on hair-trigger reflexes, but on locating strategic items. Garagon (an agile, somewhat hyperactive fellow) responds quickly to the urgings of your joystick.

The graphics are excellent. Screens are well-drawn and detailed, enlivened with spot animation. Mysterious discs rotate, energy fields coruscate and terminals with lines of scrolling static are like eyes rolling endlessly upward in their sockets. Everything gleams with a metallic, high-tech sheen.

The sound effects are convincing, and each level has its own musical theme. The best piece greets you at the game's title screen, and is good enough to cause you to linger there. Unfortunately, the screen itself is a muddy disappointment—an anomaly among the otherwise fine graphics. A simple keypress banishes it from view.

The only other complaint I have is the color selection used on some of the playscreens. Occasionally I found them a bit garish.

But these are quibbles. Tecno Ninja is one of the best games in the KE-Soft stable, and it delivers hours of enjoyment. I have no problem in recommending it.

A point of interest about this game is that it's in compiled Turbo-Basic. Readers who wish to advance beyond BASIC, but are not quite ready to take on assembly language, would do well to take a look at Tecno Ninja and see what can be accomplished with Turbo-Basic (a PD language!).

The disk directory is not hidden, thus giving you access to portions of the game. For example, the title screen is in 62-sector Micro-Painter format, so you can replace it with one of your own (as I did). However, the color registers are set by the main program, restricting you to the same ugly combination as the original screen.

If you want to hear the complete musical score, know that RENDESV4.MUS is the name of the theme for level 1 (the airport). A bit of renaming will accomplish the rest.

The disk comes enclosed in a folded card with a pen-and-ink drawing on the front and instructions inside. To play, you'll need an XL or XE machine and a drive capable of reading enhanced density. The cost is $14.50 plus $3 shipping & handling. Order from:

Software Infinity
642 East Waring Ave.

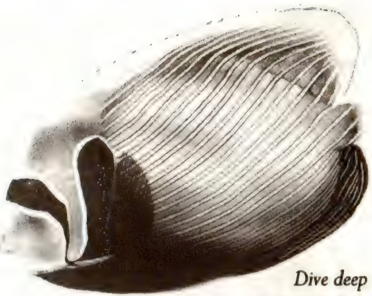
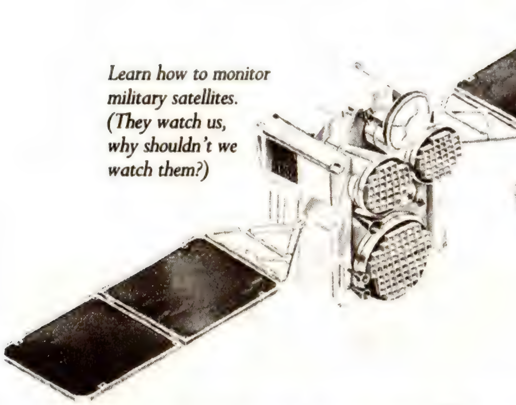
Shop. But don't drop. Need a 100% cotton pinpoint oxford shirt with button-down collar? In ecru? Try on our Electronic Mall®



Dive deep into aquarium lore. Like whether a canister or protein filter is better for a 110-gallon salt-water tank.

Price a new Mustang. Or just learn everything about it.

Finally, a computer information service you can't outgrow. No matter how hard you try.



Learn how to monitor military satellites. (They watch us, why shouldn't we watch them?)

Find out just what the heck a zither is.

Talk to twice as many people about parallel universes.

No matter what you're into, you can get more out of CompuServe.

You can range widely over a list of services that will help you, entertain you, teach you, and challenge you. Or delve deeply into your favorite topics, learning (or even teaching) more, meeting experts, and making friends with people who share your interests.

CompuServe lets you do everything from keeping in touch with our communication services, to getting advice from online hardware and software experts. It's the one computer information service you won't outgrow.

But you will have a good time trying.

For a low one-time membership fee and $7.95 a month, you can use our most popular services as often as you like: news, sports, weather, shopping, reference materials, our electronic mail service of up to 60 messages a month, and more. Plus, there's a whole universe of other, extended options available at nominal additional charges. Your first month on CompuServe will be free, and we'll give you a $25 usage credit to explore our extended services.

To buy a CompuServe Membership Kit, see your computer dealer. For more information, or to order direct, call 800 848-8199 (614 457-0802 for international inquiries).

CompuServe®

The information service you won't outgrow.

The Atari Portfolio Palmtop

The ads are enticing: save precious time, buy a laptop for $1,595. It makes sense...but unless you're bucks-up, it's just one more item to lust after. There *is* a way, though, to extend your business day with a portable computer at just a third of the going laptop price, even with a complete set of accessories. Just purchase an Atari Portfolio palmtop, an almost unknown $200—yes, $200 at discounters—real MS-DOS computer that's compatible with your IBM and Mac desktop systems.

Zane Binder

Wait, how can tiny Atari, better known for Pole Position than anything else, undercut the industry giants? What's the catch? Well, there isn't one! The Portfolio's not as convenient as a "full-size" laptop, but its price, portability and size advantages are overwhelming.

The Portfolio, in keeping with its palmtop designation, has the dimensions of a video cassette tape and weights just 15 ounces. That means it's small and exceptionally portable ...but also indicates the QWERTY keyboard (you can reconfigure to DVORAK) is tiny and the LCD monochrome screen is just eight lines deep by 40 characters wide (though it adjusts to scroll to more than 200). The remainder of the Portfolio's design—aesthetics, key feel, quality of materials, etc.—is absolutely top notch.

That's an extremely important concept: it doesn't look or feel like a toy. Someone considered these items as well as strict functionality when the Portfolio was designed. It's an indicator—as in testing autos—of what lies "under the hood" in the items you can't easily see or assess. As mentioned above, the Portfolio uses MS-DOS...but not the current version 5.0.

Built-in (actually burned into ROM), as distinguished from loaded through software, is a modified version of 2.1. Why? Because it's much, much smaller than 5.0 and works well with the Port's internal 128K memory. That figure, to those accustomed to 4MB RAM and more, may seem absurdly small. But it's all according to how you view this tiny computer's mission ... and just as importantly how you count RAM. The Port's primarily designed to use its five built-in ROM applications: an ASCII word processor that types in three languages, a Lotus 1-2-3 compatible 127 column by 255 row spreadsheet, a gigantic diary/appointment book/clock with

alarms and graphic calendar, a sophisticated calculator with statistical functions, percentages, square roots, five separate memory banks and print capability, and a complete address/telephone book with automatic tone generator and dialer. None of the above is to imply outside programs can't or shouldn't be used... only that this three AA battery or AC powered unit isn't, and never will be, a complete substitute for your desktop unit!

In the Portfolio's circuit-board heart beats an 8088 processor, famous as this was the engine that powered the original IBM PC. Though slow by today's standards and eclipsed years ago, in this application it possesses almost all the computing power you could want. By now you're probably asking how the Port stores its data. Very well, thank you, on tiny wallet-size, self-powered, metallic RAM cards of up to 128K (512K is coming). Each 128K card holds between 50-60 typewritten text pages by actual test. No more room on one for a really large application? Just switch cards! Decide you need more internal memory for a program? A half-megabyte upgrade's available from a licensed Atari vendor!

Transferring data to desktop units is easy, too. Parallel and serial adaptors are supported, but the easy way is through a "card drive" (less than $100) that allows your main PC to read and write the memory cards exactly like a disk drive. You can run hard drives or even regular disk drives with the Portfolio, but not quite as conveniently. Printing documents with the Port is a snap, too, either from your office unit or tiny Bubblejet printers.

Taylor Ridge Books
P.O. Box 78, Manchester, CT 06045
(203) 643-9673

What kind of software or ROM cards are available for or usable on the Port? An enormous variety, including BASIC programmers, spell checkers, chess, stock/bond/option trackers, numerous special medical programs for busy doctors and nurses, check-writers and too much else to name. I've been informed even the old Wordperfect Jr. program works on the Port, but I didn't have a chance to test it.

One of the unit's best features is its support within a special Portfolio Forum on CompuServe (yes, you can mate it to a modem). Atari monitors CompuServe daily, there are numerous programs to download, and fellow Port users are always available for the tips these mechanical wonders always seem to require to extract their fullest potential. Atari also sponsors a Technical Support Line, and even out of warranty Portfolios can be repaired for a flat fee.

Aside from the limitations already mentioned, does the Port have any other drawbacks? Just that its documentation is dismal (though books are available).

What's the bottom line? The diminutive Portfolio is the best bargain in the palmtop field. Yes, some have more capability, but also cost considerably more. The Port's size, as with all palmtops, is both a fantastic asset and a liability. But, without a doubt, this tiny, sophisticated wonder will vastly increase productivity while on the go—and won't cost you or your firm a fortune. Atari Corp. of Sunnyvale, CA has sold 250,000 Ports since introduction day, but to say the unit's "invisible" in the US market would be an understatement.

You probably *have* seen it, though: it was the computer young John Conner used to empty a bank 24-hour cash machine in Terminator II.

In reality, with its low cost and relatively high power, the Portfolio will help keep cash *in* your wallet... all the while tremendously increasing your productivity.

So You Want to Start a User Group? Part V

Tim Holt
ACCEPT

In the past four articles, we have looked at the pros and cons of getting a user group started, and what it entails to do so. You, as a club founding member, must realize several things by now:

1. You will spend money on the club from your own pocket.
2. You will spend lots of time getting people to just show up at the meetings.
3. You will run into members that don't agree with you and won't help you.
4. You will run into members that want to pirate programs at the meeting.
5. You will "burn out" mentally if you do not get help.

In this column, we will look at how to solve problems 4 and 5.

Aye, Mate! Got any new Programs???

It will happen. Some of the members of your club will try to use the club meetings as monthly copying parties. These people don't care if it is the latest programs, 10 year old programs, or programs that haven't even been released yet.

Our club once had a member that prided himself on the number of programs he had that were still in the beta test version. This guy had every thing. He had a software version of the Spectre GCR! I don't know how he did it, but it worked somehow...

And don't just assume it's the kids that act this way. Our Blackbeard was about 55 years old!

There is only one way to deal with pirating in your club: *sternly.*

From the very outset, your club should have some type of anti-pirate statement, either in the bylaws, in the newsletter, or somewhere. Every member should be made aware at the time of getting a membership that pirating activities will not be allowed.

Plain and simple: The board, the president or some club officer, should have the authority to dismiss a member for pirating during club activities. The member shall forfeit any and all membership fees, and will be dismissed from the club forever.

I know this sounds harsh, but face the music folks; pirating killed many a company's interest in the Atari. Just ask the folks at Spectrum Holobyte. Your club is a forum to support the ST/TT, not a place to do it more harm.

Please note, however, that your authority is limited to the club only. What members do outside the club meetings, however unfortunate, is their business. Billy Bob may be the world's biggest owner of non-purchased software, but if he keeps his nose clean during the meetings, then you cannot take any actions against him.

Also, be on the guard for rumors. Seeing is believing, and that's the only way it should be. There will be times when someone will offer you a program. Politely state that as an officer of the club, you cannot possibly copy software. Set the example for the rest of the club. It may not impress everyone, but that kid in the back might remember it, and that makes your example worth it.

HELP!

There will be times when you simply need help in the club. Here are a few hints and tips to keep things moving smoothly...

1. Remember that the ST/TT line of computers can emulate the Macintosh and MS-DOS worlds very easily.

Therefore, any demo that has been placed out for the IBM and Mac world is fair game. Believe me, almost any Macintosh program released has a demo that the company released for it. All are disabled somehow, but all can be used for your next club's meeting. Where do you get these demos? Simple. If your town has a Mac club, they have Mac PD software and demos. Ditto for the MS-DOS world (No pun intended).

The online services are also a good source. All the big name Mac and IBM developers, for instance, have areas on CompuServe and many of them are also on GEnie. Via CompuServe, you can also access an area run by Ziff-Davis, publisher of many Mac and PC magazines. America Online has a strong and growing Macintosh support. Another good, and cheaper, source is local BBS systems supporting the Mac and IBM. While they may not have as many different files as the pay services, they don't usually charge for access.

2. European magazines always have demo disks with them.

ST Format, ST User, etc., always come with a disk full of demos...lots of them games. You can get these magazines from your local dealer or through the mail order places. Also, the magazines themselves make nice reading for members.

3. AtariUser magazine is one of the best buys a user group can get. Why? Because it's FREE!

That's right, *free.* All your group has to do is pay for the shipping. AtariUser is very up to date, and very nicely laid out. A great magazine at a great price. I don't know how they do it, but support them! You help them, they help you. Contact AtariUser at Quill Publishing Co., 113 W. College St., Covina, CA 91723-2008.

4. Make a magazine, such as AIM, your newsletter.

You save tons of time, and the product is probably a zillion times more professional looking than you could do. Of course, you lose some of the intimacy associated with a locally produced newsletter, but the members in our club howl like coyotes if they don't get the monthly AIM.

5. Remember to go for the unusual speaker.

Have a policeman give a demo on home security, have a computer scientist give a speech on the history of the computer, have a local computer store owner demo his wares, even if he doesn't sell Atari. (He may change his mind after seeing 50 computer users sitting there with checkbooks in their hands...) Get a musician to give a concert at your meeting, or have an artist come in and try some art programs with the computer.

6. Use Atari.

Atari has this guy named Bob Brodie that can answer all types of questions, may be able to point you in the right direction, or will darn near kill himself trying to find out something for you. Drop him a line at Atari or leave him a message on GEnie (to BOB-BRODIE). Really, for all their faults, Atari does sometimes, every once in a while, send out warm fuzzies to user groups. Who knows, it may be your turn to get a fuzzy.

By getting help, you will feel a lot better about the club, and you will avoid getting burned out by doing all the work yourself.

Well, I hope this series of articles has helped you set up a user group in your town. Drop me a line sometime, and let me know how your club is getting along. I would like to know any unusual ideas your club has used successfully in the past for a future article. My address is:

ST VERSUS IBM HARD DRIVES

ERIC SCHOFIELD
RACE-NC

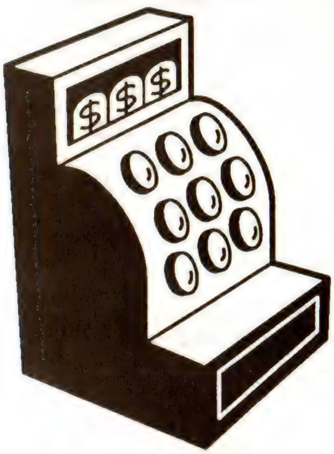
Purchasing a hard drive for the ST seems to cost so much more than purchasing one for IBM compatibles. Over the past 6-7 years, I've heard this gripe numerous times. Even I have said this. But, after working in the PC industry for several years now, I realize that this simply isn't true.

What misleads people are the prices of the bare hard drives boldly printed in the PC magazines. These prices only reflect the price of the hard disk. Once you add all the other goodies, the price of the system is considerably more.

The prices I'm quoting in this article are actual street prices. You can flip through the pages of Atari Interface or any Computer Shopper and get the very same figures that I'm getting.

One of the more popular hard drive configurations is an 80 megabyte hard drive using a Seagate mechanism running at 28 milliseconds. In order to assure that the ST hard disk and IBM hard disk perform as identically as possible, the equipment purchased must be near identical in performance.

There are numerous interfaces available in the IBM world such as IDE, RLL, MFM, ESDI and SCSI. Some are better than others and SCSI would have to be considered one of the best simply due to its versatility and speed. SCSI interfaces are the standard interface used on Macs, STs and Amigas. For this article, I use SCSI interfaces for both machines.



STs use the DMA port to interface with the SCSI host adapter. Due to this fact, the STs have *blazing* hard drive transfer speeds that are far faster than your standard IBM hard disk. In order to match the speed of an ST hard drive system, the IBM system must be configured with a 16-bit controller rather than an 8-bit. This obviously pushes the price up. Here are the results of what I found.

IBM Compatible System

Case & power supply	$100
ST1096N 80Mb hard drive	$300
16-bit SCSI interface	$200
Total	$600

Atari ST System Do-it-yourself

Case & power supply	$100
ST1096N 80Mb hard drive	$300
SCSI-DMA host adaptor	$100
Total	$500

Atari ST System Ready-to-Go

Pre-assembled & tested	$550

As you can see, the cost of the ST system is *less* than the cost of the equivalent IBM hard disk system. Even if you were to exclude the case and power supply from the IBM system (you would do this if you had room inside your case and simply needed to add a hard drive and controller), the price is comparable.

If you're in the market for a hard disk, don't feel jealous of all those IBMers out there. You can actually spend less for *great* performance. (Note: To build your own hard disk system, cables are also necessary. These cables shouldn't cost more than $20 total for either platform.)

Advanced Gravis MouseStick

Jim Trageser
SDACE

For the past few years, the debate on input controllers has consisted of "Mouse or trackball?" Now, Advanced Gravis, a Canadian firm known for its line of joysticks, has upped the ante by introducing its MouseStick programmable optical controller.

The Atari platform was one of the first that the Gravis MouseStick supported, and my review copy has been bug-free (although the first unit they sent me was non-operational, they quickly replaced it with profuse apologies and a fully working unit).

The main selling points for the MouseStick are its programmability and the fact that it emulates an analog signal on the ST line of computers. Both are likely to be of interest to Atari users, especially since analog input allows for vector modes, and the programmability allows for custom-designing your own vector. In addition, the MouseStick has a built-in setting that acts as a straight Gravis Switch Joystick.

Atari ST computers use digital input—the mouse sends a signal that it is moving in one of eight directions, and how far it moved in pixels. The MouseStick sends an analog signal, which is non-digital. This means that, in vector mode, you can have a variable rate of cursor movement, depending on how far in any direction you push the stick handle. Of course, in joystick mode, the MouseStick sends a digital signal.

How the Gravis MouseStick Works

The MouseStick comes in two pieces: the stick itself, which looks just like the Gravis Switch Joystick for the Atari, except in a light gray instead of black; and the Gravis MouseStick Processing Unit (GMPU), which is a small (3x5 inch) box with an LCD display that connects the stick to your mouse port. It is the GMPU that both emulates the analog signal and allows the MouseStick to be programmed.

There is no external power source—the MouseStick draws its energy from the mouse port.

As with the Switch Joystick, the stick unit has three buttons—one on top of the joystick and two to the left side of the top of the base. Each of the buttons has a function-selecting dial on the left side of the base which allows any button to be manually set for, in the case of the MouseStick, right or left mouse button or editor button. For most applications, each button will be set to a different mode, giving you all three options.

In programming the MouseStick, you enter the editor mode by clicking five times quickly on the editor button (which otherwise acts as a second "left" mouse button). The LCD display then indicates "Entering Editor." At this point, you access your different menu choices (shown on the GMPU LCD) by moving the joystick through the bottom half of its range of motion (if the range of motion is pictured as a clock face, the menu ranges from 4 to 8). To facilitate programming the MouseStick, Gravis includes a quick-reference menu chart.

The programmability feature allows the MouseStick user to pre-save up to six customized settings. The first variable likely to be entered is the monitor size; one can pre-set and save—by pixel resolution—low-rez, medium-rez and high-rez settings for the ST. While the GMPU includes some of the more common resolutions built-in (low-rez and high-rez for the Atari; other resolutions apparently common on the Amiga platform, which shares the same MouseStick model with the Atari), one can also custom-set the X and Y axis within the editor, allowing any monitor resolution to be used.

Other options within the editor mode include designating one of the buttons as

"turbo," or auto-repeating. This mode also allows you to set how quickly the "fire" mode will be repeated, in increments from 0.1 to 5 seconds. There is also a "null" mode in which you can create a dead zone around the "centered" position so that small, accidental motions to the handle don't affect the cursor. A "priority" setting makes sure that small movements of the handle when clicking the cursor on a GEM icon don't accidentally cause the wrong program to be loaded.

Admittedly, it took some getting used to when I first hooked up the MouseStick. In high-rez mode, it is very sensitive—far more so than a mouse with the Atari accelerator (which has to be disabled or the MouseStick won't work).

I also found the auto-centering feature was annoying and the GMPU apparently does not let you turn it off. Thus, I found the best way to deal with it was to loosen the adjustable spring on the joystick handle all the way, thus mechanically bypassing the auto-centering.

I now find that I prefer to use the MouseStick for almost all applications. Using the MouseStick requires far less arm and hand motion than a mouse or trackball and results in less fatigue. I simply point the stick handle in the direction I want to move the cursor and hold it steady until the cursor gets there. If I'm in vector mode, the cursor gets wherever I am pointing very quickly.

More importantly, I find I have more control with the MouseStick and am more productive. Using PageStream with the MouseStick is a dream compared to my stock Atari mouse. And while artists may prefer the more "natural" feel of a mouse for drawing programs, I like the control I get with the MouseStick.

For drawing programs, flight simulators, etc., the vector capability can make a dramatic difference in performance and handling. The vector mode allows you to set up the MouseStick so that the rate of cursor movement varies with how far you push the stick away from center.

The instruction book is easy to read and understand, and the menu chart doesn't take long to memorize. All in all, the MouseStick, for all its options, is easy to learn, making it an effective tool.

A Gravis spokesman said there have been problems with Mega STs, and was unsure how the MouseStick would interface with the TTs. But he assured me the Mega bug was easily fixed with a program Gravis would send free to any Mega user. Also, 8-bit owners using a GUI program may not be able to use the Gravis.

The price is steep; manufacturer's suggested retail price is $99.95. But, for those who are uncomfortable with a mouse or trackball, or who simply find they don't have the amount of control or options they would like, the MouseStick may be the answer.

[About the Author: Jim Trageser is a 10-year user of Atari computers, and he currently owns an Atari 800 and a 1040STfm.]

A-T-A-R-I

ANSWERS, TIPS AND RELEVANT INFORMATION

ULTRA SPEED PLUS

Paul Alhart (AFED)

One of the most cherished things we have is time. It seems we never have enough of it, so whenever something comes along that promises to helps us save time we jump at it. Be truthful now, why else would you have bought that super-duper dicer/slicer Veg-O-Matic that is stored over the refrigerator? OK, but that microwave oven sure is a time saver.

Well, in the computer world where time is measured in microseconds, faster is definitely better. After all, a big selling point of any computer is how it will help you get organized and save you lots of time.

Sooner or later though, time seems to lose its relevancy. Two minutes to do a former 30 minute job seems much too long if the same task can be done in one minute. This is the main reason I was anxious to try out the Ultra Speed Plus from CSS.

US+ is designed to be installed in an 800XL or 130XE computer and gives you three different operating systems (O/S) that are switch selectable. (More on those later.)

Installation requires some soldering, but the instructions and diagrams are clear and easy to follow. Installation takes about an hour from start to system checkout. If you don't feel at ease inside your computer, CSS offers free installation for this, as well as any of their other products.

As mentioned above, the US+ has three switch-selectable operating systems. Following is a description of each.

XL-FIX Plus—This O/S makes your XL think it is a 400/800. This eliminates need for Translator programs and still allows you to use a RAMdisk on machines with extended memory. A Binary file loader is built in, the key repeat rate has been speeded up, and the effect of the Option key has been reversed when booting. (Hold down the Option key to enable BASIC.)

Standard XL/XE—This O/S is the same as what is in your computer now.

Ultra Speed Plus—This O/S gives your computer more speed in several ways. Disk I/O is about three times faster than normal when used with XF-551 drives or modified drives like Happy (810/1050) or Super Archiver, US Doubler, Klone, Duplicator or Density Doubler (all 1050 mods). The key repeat rate has been increased for faster editing. The Faschip math routines have also been included for faster and more accurate floating point math which increases program execution speed.

Although the speed is what sold me, US+ has many more great virtues. Any one of them could be a good enough reason to purchase US+. *Some* of them are:

A built-in RAMdisk handler allows a RAMdisk to be used with any DOS
Several functions such as key click, background color, screen DMA, I/O sound and more can be toggled via the keyboard
Drive numbers can be reassigned using a drive configuration menu, so you can boot from any floppy, or even from your RAMdisk
Cold Boot without losing RAMdisk contents, even if the system is locked up
A sector copier is included that uses no program memory
The OPTION key is reversed during boot. (Hold down OPTION to enable BASIC)

So what do I think of US+? I couldn't live without it. I get this warm feeling whenever I hear my programs loading in at Hyper-Speed. My wife thought the faster I/O sound was the phone ringing. Although it's still not as fast as hard disk, it sure is a lot more affordable.

I have used the drive configuration menu to make my RAMdisk Drive #1. That way, I can run programs out of RAMdisk that only support one or two drives. You may not associate this with speed, but it is a real time saver. I copied AtariWriter's dictionary to RAMdisk, made the RAMdisk Drive #2, and watched it *fly* through documents as it checked my spelling.

Another time saving use is with disk/sector editors. I can search or scan a whole disk in seconds if it is first copied to RAMdisk. Making the RAMdisk Drive #1 allows me to cold boot from the RAMdisk to verify my changes. I then can set any other drive to be Drive #1, reboot any DOS with my RAMdisk still intact, and copy the RAMdisk back to floppy. All this copying may sound time consuming, but it isn't with US+ fast I/O.

I have found no compatibility problems with any XL/XE software using US+. However, the original XL/XE operating system is always just a switch click away just in case.

Outside US: no personal checks

CSS claims that, with US+, powering down to recover from a lock up is a thing of the past. So far, I have proved them right. No matter how bad I freeze up my system, pressing HELP/RESET always initiates a cold boot without erasing my RAMdisk or clearing any extended program memory.

Is there anything I would change? Sure, but only out of personal preference. Both the XL-FIX and US+ operating systems reverse the effect of the OPTION key at boot up, while the standard XL/XE O/S does not. To avoid confusion, I would make them all the same. Since I will probably spend 99 percent of my time using only the US+ O/S with all its neat features and speed anyway, forget I mentioned it.

Try it, you'll like it.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

SHIPPING And HANDLING is always just $3 in North America and $5 Internationally, regardless of quantity of *KE-SOFT* products ordered. NO State Sales Tax is due.

THE GOOFY GURU

Space Bars and Peripheral Switch Boxes

Charles Kelly (SNACC)

Atari 800 Space Bar Repair

If the space bar on your Atari 800 has broken in any way, the space bar is probably hanging. If not, the plastic piece of the bar is easy to pop out.

Pop it out. Look at the white plastic square in the center of the exposed area. Press the square. If it moves up and down, go on to the next paragraph. Otherwise, take a firm grip with a pair of needlenose pliers and pull out the white plastic piece. Use a firm, even grip.

You should find a spring that is snagged. Snip out the metal pieces other than the spring and reassemble. The white plastic piece should now work and come back when pressed (those metal pieces are usually the actual switch, but we are bypassing them altogether).

Now, look at the two exposed wires on both sides of the black square that the white piece was in. Cut them with a razor blade or knife as close to the front as is exposed. Solder a 4-inch length of insulated wire to each. Tack these down, where soldered, with Krazy Glue or a similar product.

Take the left wire and strip back about 1.5 inches. Do the same on the right. Wrap six to nine turns of the left wire around the piece the space bar snaps into. Take the right wire and Krazy Glue the end just under the right end of the same mounting wire on the right end. This end should rest on black plastic. Take out some of the slack on the righthand side by tacking down the middle of the wire to the off-white or beige board.

You should add a first step if the tongue where the space bar presses the switch is broken also. Just glue it back after checking and/or repairing the spring action. Then go ahead with the wire cutting steps. *Note:* In some rare cases, the colors mentioned here will be different on your computer, but this is not too critical.

The Mucho Simpler Peripheral Switch

Forget all of the complicated articles you have seen about building peripheral switching boxes. But, do call in any old 810 rear boards or finally dead 835 or 850 boards you can find. Bless their little hearts, but some of the articles published on this topic have been too complicated. Start by looking at whatever old peripheral board you have and examine all of the traces that connect to both CIO ports.

It does help if you have a good diagram of the port connectors. You begin by marking the traces between the port connectors and drawing a line around all of the traces that join the ports. You want them left totally intact. Now, take a serial connector and snip off one end. Take one probe of a VOM and put it in Pin 4. Find the wire that goes to Pin 4 and mark it. Do the same for Pin 6. Solder the wire to Pin 4 to the wire for Pin 6.

Plug in the cable end to one of the serial ports. Test for continuity between the remaining wires and the port with the cable left plugged in. Skip the wires for Pins 4 and 6. Where the wires show continuity, solder them to the board at the appropriate pins of one port.

Unplug the connector. It will be the input to your switch box. Now solder a wire to where you joined the wires for Pins 4 and 6 and wrap tape around the connection. Take this new lead and solder it to the center pole of a normal two-position selector switch (SPDT type). Be sure to use a switch that is small enough to fit on top of one of the connectors.

Now, examine the port connectors themselves. There will be a series of leads that curl down from the connector to the board. As close to the board as you can, cut the leads for Pins 4 and 6 that come off the connectors. While both connectors must have these leads cut, only one pin has to be used to supply the ground signal. You are unlikely to cut both pins too short or to break them both. Pins 4 and 6 will be joined in almost all Atari serial peripherals down the line. Try to use both pins, though.

Solder leads from these pins, at the connector, to the switch contacts of your selector switch. The leads from one connector go to one of the outer contacts. The opposite switch contact is then wired to the opposite port connector. Each switch contact should be wired to 2 pins, but breaking one pin will still leave you with a working switch system.

You should now have a decapitated serial cable wired to one connector and a switch wired between the ground pins. Now, cut the port connectors free along the line you drew along the outside of the traces that go between both connectors. Use a saber saw and try not to damage the board or the cable you soldered to the pins of one connector.

Glue the switch to the top of one connector. Check for shorts and other defects. Finally, wrap with electrical tape, leaving the switch lever exposed.

This is so much simpler than other articles that would have you adapt RS-232 switch boxes or wire in 9-pole double throw switches. The cables don't need extra shielding and only the ground signal leads need to be switched. There is even an advantage in that switching the ground signal avoids some handshake problems, etc. Those other articles also leave out several steps that are needed with a project like this.

You should end up with a cable that has a fat end with two connectors and a switch exposed on top of one connector at the fat end. The critical step, sawing the board around the traces that link both port connectors, is always tricky.

A similar approach can be used to make a new cable that has two regular connectors with two port connectors in the middle. Just go ahead and split a cable and connect all leads to the proper pins of one port and repeat with the other half of the cable and the opposite port. This and other super simple serial cable projects are possible because the Atari serial system has such low noise to start with.

[The Goofy Guru series originated in the Southern Nevada Atari Computer Club newsletter and continues to irritate all. Topics covered are varied and obscure. In other words, this column is devoted to topics no one else seems to write about.]

Boot up once with Warp 9, and you'll never want to be without it again. Warp 9 increases the speed of screen output dramatically - windows snap open, graphics appear instantly, and text *flies* onto the screen.

How is this possible? Most GEM programs display graphics and text by calling standard routines built into TOS. Warp 9 intercepts and handles these calls, with optimized assembly language code that is *much* faster than the built-in routines. Graphics and text still look the same, but appear with astonishing speed!

Warp 9 also includes a unique configurable mouse accelerator, desktop pictures, custom screen fonts and fills, and the Warp 9 Customizer, a program that lets you create your own fonts and fill patterns. And best of all, Warp 9 is compatible with all the programs you run. Ask your local Atari dealer for your copy of Warp 9 today!

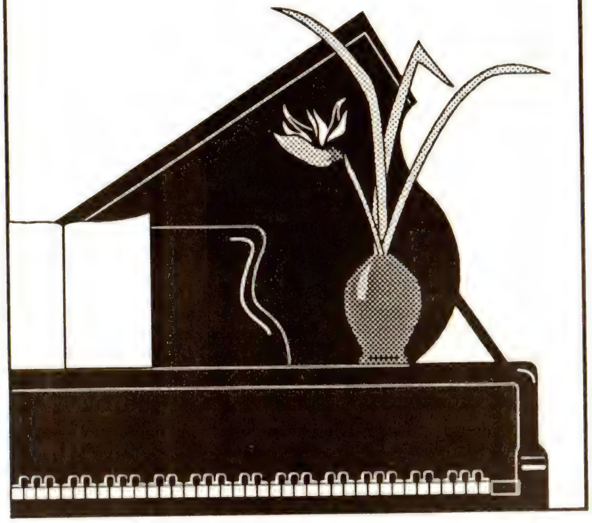
MIDI in the Midst



The Chicago Show
Parts 2 & 3

Kest Carter-Morgan
ASTMUM

First, let me answer a few questions some readers have asked concerning my previous article: *What were the "unlikeable aspects" of the pre-show reception, mentioned in Part I of your series?*

Intended for Atari developers, exhibitors and show organizers, that reception sent conflicting messages. Although it was held in the hotel's Penthouse Ballroom, someone forgot to make more of the intended guests aware of when and where it was happening. No one posted signs that would have helped them find the place (after riding the elevator to the top, many returned to ground level assuming it was cancelled).

Those that made it were confronted, at the door, by a lil' old lady selling tickets for drinks (even the soft drinks!). The free food consisted mostly of those things that are supposed to be good for us (raw broccoli, cauliflower, carrots and celery). No one seemed to be in charge. Our music helped, but I would have liked to have planned music for the occasion. The vastness of the room, coupled with the small attendance, robbed the reception of its warmth. It wasn't intolerable; it just wasn't comfortable.

Atari and the Chicago ComputerFest organizers could learn from the WAACE show organizers. They hosted a very hospitable reception last October! Perhaps, through experience and attention to detail, the WAACE people developed a formula for success. Listen up, Atari!

Why do you feel it's so important to videotape everything at these shows?

It's true that a lot of the information we tape could be obtained through print and telecommunications media, but it's that personal touch I'm after. It gives our members a better sense of the Atari community and the forces that effect its stability. They appreciate the work developers put into their products and, after video demos, I'm pleased to find that members are sending in their shareware payments and taking advantage of special offers. One example is a demo of Gribnif's product line by Rick Flashman. It impressed our members enough to stimulate orders. I'm sure Rick is pleased!

Is There a Montreal Show?

One of our group's objectives at the show was to distribute, from our booth, maps and tourist information promoting Montreal's 350th anniversary in 1992 (from May 15 to October 12) and to suggest Montreal as the site for a large-scale AtariFest!

By now, readers must be aware of the Atari Canadian Exposition (ACE '92) held in Toronto, Ontario, this April 4th and 5th. ASTMUM was assigned booth #316. Even though we're mostly MIDI musicians, we asked to be located away from the MIDI area so that our music would not conflict with the 'round-robin' music demos and stage performances slated for that area. Since I'm writing this, weeks before the show, I can't report anything till later. Writing this stuff is like time travel!

Something important is slated for the end of May. It's *"The Largest And Most Innovative Trade Show In Canada For Sound And Image Professionals."* Production '92 will be held in Montreal, Quebec, at Place Bonaventure, May 29, 30 and 31. This year, emphasis will be placed on European and Asian interaction with the North American communications market, demonstrations and workshops highlighting the newest products, combined with the sixth Festival International du Film par Ordinateur de Montreal (FIFOM '92), the second International Competition of New Media Technologies and much more! For show hours, details and information about participating, please contact Mr. Martial Brissonnet at: (514) 842-5333, or Fax: (514) 842-6717.

At Production '92, some ASTMUM members may be present, at one or more of the participants' booths, to help explain how Atari ST and TT-based equipment perform—in music, sound and image production. It is hoped that Atari Canada will also be there.

Let's get back to the show. We jump back in time, now, to Saturday, November 23, 1991.

Many musicians are computerphobes. Historically, they bought computers disguised as "hardware sequencers," often at prices higher than complete Atari systems! Even though musicians have become more sophisticated lately, many simply cram their sequencer program disk in and boot up without useful AUTO folders or desk accessories; they don't even date-stamp their files. This show, like many shows, was a gold mine of goodies useful to musicians, from the clearly evident to the obscure. I'm hoping such handy items won't be ignored.

Let me whet your appetite by listing the exhibitors most relevant to our MIDI pursuits:

- Atari Corp.
- Guitar Plus
- Roland Corp US
- C-Lab Software
- Hybrid Arts
- CodeHead Software
- Atari Explorer Magazine
- Oregon Research Associates
- Lake County Atari Computer Enthusiasts
- Atari ST/Mega Users (Montreal)

Since I'm reporting on the MIDI (Musical Instrument Digital Interface) aspect of the show, let me get one non-musical MIDI application out of the way—Games! The Milwaukee-based user group, MilAtari Ltd., set up 32 STEs in two groups of 16 players and MIDIed them together to play MIDI MAZE. It was one of the many activities they supervised in the large Gaming Area, just a step away from the main exhibition floor.

Guitar Plus

It's encouraging to see a music store chain participate in shows like this, and with MIDI being one of Atari's strong suits, it's essential that everyone pitch

in. Bob Lytle, of Guitar Plus (a Chicago area chain with 3 locations), gave two MIDI seminars at the show. One seminar was for the home MIDI hobbyist and the other was geared to professional studio applications.

Bob was also kind enough to provide some of the sound equipment presenters (myself included) needed for seminars held in other parts of the hotel. Chasing around with one video camera, I wasn't able to capture all seminar contents, but reports were positive. At intervals during the show, I stopped to visit at the booth areas Bob managed (Guitar Plus, Roland and C-Lab booths were side-by-side). Most of the products displayed were available in Montreal music stores, but, admiring a C-Lab wristwatch, I filled out and deposited a slip for the random drawing, hoping to win it.

Explorer's MIDI Issue

You're reading AIM right now, but if you're a musician, you should seek out the MIDI issue of *Atari Explorer,* which came on the stands this February. It can serve as a good reference. The Atari Artist supplement to that issue shouldn't be missed.

Interestingly, I got some informative video footage during John Jainschigg's seminar on "Atari Journalism," in which Bill and Pattie Rayl were comparing their editorial policy with John's. One way to see more MIDI-related articles is to write them yourself!

Hybrid Arts

Hybrid Arts has been a long-respected Atari developer. I, personally, know some ASTMUM members that, daily, crank out their work (television music tracks, jazz arrangements, etc.) using Hybrid Arts' sequencing software and their famous device that you connect to the DMA port for up to 64 MIDI channels (the MIDI-plexer).

In recent years, C-Lab, Steinberg and others dazzled musicians with their improved user interfaces and features while Hybrid Arts retained their stodgy, but functional, front end. For a while, it seemed that they were falling behind as they struggled to gain market acceptance with their ADAP Sound Rack hard disk, digital audio recording system. It was expensive and, reportedly, not trouble-free.

As long as Atari Megas (with the internal, Bus Extension slot) were plentiful, their competitor, DigiDesign, made incursions into their territory. But, as the supply of Megas began to dry up, dealers began to push DigiDesign's version for the MAC. This was bad for Hybrid Arts *and* Atari (the new MegaSTEs lack that slot)! From a marketing perspective, things seemed somewhat grim.

Now, Hybrid Arts was back with a vengeance! I was there, capturing all I could on video tape.

Note: In the Atari Artist *section of the Feb. '92* Atari Explorer, *on pages 12 and 13, you'll find James Port's write-up of SmpteTrack Gold, Hybrid Arts' new, flagship sequencer. Their patch editor/librarian, GenEdit, is noted on pages 17 and 18. Music scoring, limited to three parts, is accomplished with their Easy Score Plus notation software, mentioned on page 23. Digital Master, the talk of the Chicago show, and its more expensive relatives, ADAP II and ADAP IV, are detailed in an unattributed write-up on page 22.*

Feeling the camera's weight on my shoulder, I tried to get a stable position as Hybrid Arts' Sales Manager, Jeff Naideau, triggered an impressive demo on their $4500 (excluding the outboard controller) 2 track Digital Master hard disk recording system. With this basic system, the 105 Meg drive provides 10 minutes of stereo recording at 44.1 kHz. Jeff alerted us to calculate about 10 Meg for each minute required to determine hard drive choices meeting users' needs.

Before launching the second segment of music, he stated that the recording (taken from a CD) was 64 times oversampled during record and 8 times oversampled during playback, obviating the need for special apogee filters. To extend sampling time, the lowest selectable rate is 22 kHz; not the figure given in Atari Explorer.

Up to 200 markers can be placed, visually, in each sound file as "auto-locators" (edit points) using the Atari's function and Tab keys. He demonstrated the ease of marking two points in a musical phrase and "looping" that section to play over and over.

The markers also allow anyone to reorganize the order segments are played (with noise-free, electronic splices) through an easily accessed, programmable play list. With the ability to have up to 8 files open at the same time, the possibilities are endless for manipulating large and small segments of files, and creating new ones, in the digital domain.

Jeff made the point that Quebec's Celine Dion, and her keyboard player, use this equipment in live shows and vary the play list, nightly, to keep things fresh.

Although the demo was conducted on a color monitor, the software works with mono monitors as well.

They had not yet launched their 4 track version (it was planned for a March debut) but Jeff mentioned future "software links" with SmpteTrack Gold for interaction with the 4 track version. By now, all of this should be available.

In order to highlight important details about their multi-tasking environment and give proper coverage of their products, I'll have to finish my Hybrid Arts profile next month. In the meantime, here's their address: Hybrid Arts, 8522 National Blvd., Culver City, CA 90232, (310) 841-0340.

If you think it's painful—not getting to the end of this in one shot—think of me. I'm still holding the camera!

See you next month.

Diamond Back II

Bill Rayl

What would computers be without hard drives? I can remember, barely, the days before I had a hard drive connected to my computer. It's like a bad dream that's nearly gone from my memory.

Seriously, though, hard drives are very nearly an essential part of any productive computer setup nowadays. Their relatively low cost and ease of use make them a high priority peripheral purchase. For DTP, animation, MIDI or graphics design work, a hard drive is practically a requirement.

With all their convenience, hard drives do have a drawback—you can come to depend on them too much and not back them up often enough. Backing up a hard drive is probably one of the most *boring* things you can do with your computer. It ranks up there (or down there) with watching integrated circuits oxidize.

Of course, if you don't back up your hard drive, you're just asking for trouble. I personally believe there is a chip somewhere in each computer that monitors hard drive backup frequency. If a certain period of time goes by without a backup, *whammo.*

OK, maybe I'm being a little paranoid here. Paranoia is, after all, what makes you back up your hard drive. It's like buying life or health insurance. You hope you never have to use the insurance, but you sure feel a lot safer when you have it.

Insurance Policy

Continuing the insurance policy analogy, some policies give you better coverage than others. When it comes to insuring the health of your hard drive data, Diamond Back II from Oregon Research is one of the best options available.

Diamond Back II can handle all your hard drive backup needs. From full or partial file backups to GEM or Spectre image backups, Diamond Back offers more backup options that any other competing product on the ST. It even handles partition sizes larger than 16 megabytes.

When you first run the program, you're presented with a dialog box from which you make four main choices—File Backup, Image Backup, Full Restore or Partial Restore.

File Backup

The File Backup option leads you to a dialog box where you set the various backup parameters. The options here are numerous. You can choose full or incremental backup and to include subdirectories or only files in the backup. You can opt to split files across backup disks, compress the files while backing them up and even encrypting the backup for greater security.

The ability to split and compress files are useful options that translate into using less floppies to complete the backup.

Diamond Back II also lets you define the path(s) to be backed up. You can select multiple hard drive partitions, multiple individual subdirectories within partitions and even specific file masks. An "exclude paths" option lets

DO RESTORE

CANCEL

you skip individual folders. For instance, you could choose to back up all *.DOC and *.TXT files on Drive C:, all files on Drive D: excluding those in the TEMP folder and all files found in the E:\SAVEME\ subdirectory.

Unlike many backup programs, Diamond Back II gives you the option of backing up to either floppy disks or another hard drive partition. This is a useful option for SyQuest owners or people who use a second hard drive for backup. *[For owners of a SyQuest as their only hard drive, the Hayai backup package from Machine Specific Software would probably be a better backup alternative to Diamond Back. Hayai allows switching from one cartridge to another .]*

Diamond Back further gives you the option to create a listing of all the files being backed up, including the backup disk numbers on which they appear. This listing is extremely useful for finding individual files for later restoration.

The Create Validation File creates a list of either 16-bit Checksums or 32-bit CRCs (your choice) for each file in the backup. Later, when restoring the files, you can use this list to verify the integrity of each file as it is restored.

Disk Utilities

Selecting Disk Utilities from the Backup Options menu presents a sub-menu with a number of useful choices. From here, you can create the above mentioned file list or validation file, view text files, get disk statistics and more.

Probably the most used option here is the one that estimates the number of floppy disks you will need for your backup. A nicely organized chart shows you how many disks are needed for each formatting option you can choose.

Formatting

Another area in which Diamond Back II excels is in disk formatting options. Available options include single or double sided, 80 or 82 tracks and 9, 10, 18 or 20 sectors per track.

How can you format a disk with 18 or 20 sectors per track? Well, you need a High Density (1.44 meg) floppy drive like the one Atari now sells for the Mega-STE and TT or like in the HDrive kit from Omnimon Peripherals.

You also have the choice of normal, Twister or Super faST skewing. Twister format is popular because it noticeably speeds up disk access. Super faST format is even 20 to 25 percent faster than Twister! If you have a lot of floppies to back up to, you'll appreciate the speed increase.

Image Backup

While image backups are not always the best of choices, they are extremely fast. When done in conjunction with full and incremental file backups, they offer an extra level of security...just in case.

Diamond Back II can perform an image backup of your GEM partitions that only backs up sectors actually in use on your hard drive. If you only have eight megs of files on a 12 meg partition, Diamond Back only backs up the eight megs. This gives you the ability to restore the image backup to a partition that is of different size than the original backed up partition.

Users of Gadget's Spectre GCR or Spectre 128 can perform an image backup of their Macintosh partitions. While it is preferable to do a file backup from within Macintosh mode, a Spectre image backup is far better than no backup at all. Diamond Back's Spectre backup is a full image backup—if you have eight megs of files on a 12 meg partition, you're going to backup all 12 megs. This is typically how image backups work.

Image backups have a number of drawbacks over file backups. First, you cannot restore individual files or subdirectories. Second, if your hard drive has any serious file errors at the time of the backup, those file errors will be backed up as well. Finally, disks containing an image backup cannot be read from the desktop. If you attempt to get a directory of an image backup disk, you will most likely have to reboot your computer.

For people who just don't have the time to do full file backups, image backups do offer a better alternative than no backup.

File Restoration

Restoring your files after a crash or just to defragment your drive is about as straightforward as it can possibly be. In fact, all of Diamond Back's functions are intuitive enough that you really could use the program without ever reading the manual. Built-in help for just about every option makes the software very easy to use.

For file restore, you can choose full or partial restore. The options here are numerous and correspond mostly to options available when backing up your files. You basically tell Diamond Back if the files are compressed, if they are encrypted, which files you want restored and where to restore them to.

Manual

While it's true that you might not need to read the manual to use Diamond Back II, there is a lot of useful info in it. The 40-page manual details all the options available in the program and is well written.

A section entitled Tricks and Tips on pages 30-33 gives you some hints on good backup strategies. It also tells you how to take advantage of Diamond Back's automatic disk switching capability and describes the automatic disk error recovery features of the software.

Support

The Diamond Back manual contains a step-by-step process for problem solving. Following these steps may fix your problem without ever having to contact the company. If, however, you still have problems, the staff at Oregon Research is very helpful. As the manual states, they "will do everything in [their] power to assist you."

The program's author, Bob Luneski can be contacted on GEnie, CompuServe or Usenet.

The support offered by Oregon Research for this product is superb. Fairly regular upgrades are often made available via patch programs available for download from the online services.

If you like beautifully engineered precision tools, you'll love MegaPaint Professional, the lightning fast all-in-one graphics program with a slick, easy-to-use interface.

MegaPaint was designed with the artist in mind. The list of tools is incredible: connected lines and bezier curves, ring sections, parallel and perpendicular lines, rhomboids, polygons, concentric circles and ellipses – and all tools work in both bit-map and vector modes!

You can work on up to four pictures at once, even show them all in the same window at varying intensities. Unbelievably fast block and lasso functions include rotating and scaling. MegaPaint can import Calamus outline fonts, and use them with its text editor and mail-merge features. A module is included to access several popular scanners; the ability to call external modules means that MegaPaint will never go out of date.

With all this power, you might expect an equally enormous price tag; but perhaps best of all, MegaPaint II Professional is priced well under $200!

ACE '92

The Atari Canadian Exposition

Mark Pierro
BRAG*ST

ACE '92, the Atari Canadian Exposition, was held in Toronto on April 4th and 5th, 1992. A group of BRAG ST members made the one and a half hour trip from Buffalo on Sunday, April 5th. We had a great time!

Overall, the tempo of the show was upbeat. Throughout the day, all the vendors I talked to were very pleased with their sales. The show also had some exciting events: the world's fastest ST, MultiTOS, and the debut of Flash II, GEMulator and STraight FAX. Early attendance figures were 2,000 people on Saturday and 1,000 on Sunday.

My first stop was the CodeHead Technologies booth. I had never met the CodeHeads before, but as I approached their booth, there was no mistaking them. John Eidsvoog was furiously taking orders and upgrades (and this was only five minutes after the show opened!). When it was my turn to upgrade my Quick ST to Warp 9, they ran out. But John promised it would be in the mail as soon as they got back home. (Sure enough, several days later, my software arrived.) Charles Johnson was enthusiastically demonstrating MegaPaint Professional on a TT (there were TTs and MegaSTEs everywhere). With great satisfaction, I personally gave Charles a shareware payment for his Little Green Selector and Pinhead programs.

Next it was on to Dorothy Brumleve's booth to upgrade my kid's Kidpainter disk. Dorothy was showing her latest educational program called Multiplay, a program that makes math fun.

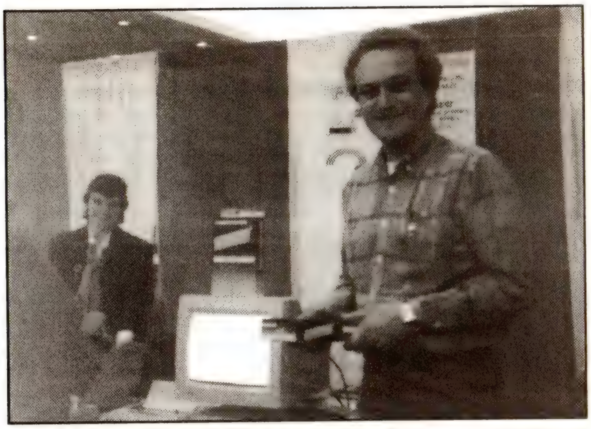
Next, I wandered into the Atari booth in the center of the room. There they had Portfolio, Lynx, ST and TT displays. But what caught my attention was the much talked about ST Book. This notebook computer impressed me with its small size and very readable screen. The "vector" touch mouse pointer controls were unusual, but once you got the hang of it, the pointer was easy to control.

Atari's Bill Rehbock was demonstrating MultiTOS on a TT in the center of the booth. He said Atari is working on this multitasking operating system (based on MINT) and it should be available for all ST users sometime this fall.

Goldleaf was showing their high-end graphics and DTP software. An impressive demonstration of the capabilities of their Retouche Professional, a 24-bit color photo retouching and digital lithography program, continued throughout the day. A photo was scanned, output to a thermal wax printer and then the image was transferred onto a T-shirt. They were also demonstrating MacRead, a program that lets you read data files from a Macintosh formatted HFS hard disk or Spectre formatted HFS floppy disk and store them on an ST disk.

Atari's Bill Rehbock showing MultiTOS

Phil Comeau was demonstrating his Grammar Expert and GramSlam programs. Gribnif Software and Double Click Software were running show specials on their software line. British Magazine Distributors were offering



John Trautschold

subscriptions to ST Format, Atari ST User, ST Action, ST Review and ST Applications.

Missionware Software was busily selling Flash II, the long awaited update to the very popular ST terminal program. John Trautschold was offering an upgrade from Flash to Flash II for only $29.95 as long as you brought your original disk.

It was a pleasure to meet Darlah Potechin, Atari ST sysop on GEnie. She was able to answer a few questions about Aladdin by showing me while she was online to GEnie. Rod Coleman's demonstration of his new text editor, Sudden View impressed me so much that I bought a copy. This program is amazing—it really is "like a paint program that uses text instead of colors". The Toad Computer booth was so busy that it was one o'clock before I could get near enough to see what they were selling. Bill and Pattie Rayl were there, taking subscriptions for Atari Interface, selling AIM disks, giving away CompuServe signup kits and selling Silhouette for Maxwell CPU who couldn't attend the show.

Dave Small had "the world's fastest ST" on display, a Mega ST2 with a monochrome monitor and a SyQuest drive running at an incredible 46MHz!

Joppa Software introduced the STraight FAX software, an ST/TT communication package which allows sending and receiving of FAX documents to and from any Group III compatible FAX machine. Requirements are 1 MB of RAM (minimum) and an industry standard Class 2 FAX modem.

Darek Mihocka was showing his GEMulator for the first time. The GEMulator is a software/hardware combination that runs your ST software on an IBM compatible PC. Darek was running on a 33MHz 486 and inviting show goers to pop their ST disks into the drive and test their favorite software. The screen display was a little slow (Darek says 100% compatibility was his first goal and now he'll start speeding it up), but everything seemed to work fine that was thrown at the GEMulator.

Cybercube had a booth at the show and they were demonstrating their CyReL Sunrise M16-1280 true color, high resolution graphics card for the MegaSTE and TT. The graphics were truly astounding, with resolutions from 256x200 to 2048x1024 supported! The guys at Cybercube Research have had the board and VDI driver in beta test for months and are getting ready to ship.

ABC Solutions was selling the newly updated Timeworks Publisher 2 which is being imported from the UK. ABC also had Home Accounts 2 and the whole line of the latest Kuma Software releases from overseas. Timeworks Publisher 2 looks to be a big improvement over the original Timeworks Publisher ST.

All in all, there were about 70 booths and nearly 50 companies at this show, including a separate area for MIDI applications. The MIDI area had such big name companies as Korg and Steinberg-Jones represented, as well as area MIDI dealers. There was also a Lynx gaming room where the kids could rent a Lynx and let the parents browse the show. Seminars were also offered throughout both days.

On our return trip to Buffalo, we were stopped at the US Border and asked to declare our purchases. As the customs inspectors looked at our software packages, they noted that the items were all American goods (and therefore no duty was required). But it was difficult to explain to them that we had to travel to Toronto to buy software for our computer. Hopefully that will change soon. From the experience of ACE '92, it looks like things are starting to improve in the Atari ST world.

FALCON 030

A Preview of Things to Come

Bill and Pattie Rayl

To steal a line from the great H.G. Wells, we have seen the future and it works! At the recent ACE '92 show in Toronto, we had the privilege of seeing Atari's newest machine, talking to developers about their impressions, and discussing with Bill Rehbock Atari's plans for production and marketing of the Falcon 030.

We can't disclose all the details of what went on in those meetings. (Well, we could, but Atari would never let us into another such showing.) We can, however, tell you a bit about the computer, since a few other reports have already been made public.

We have to warn you that this is going to be a very positive, upbeat article about Atari's future. If you're a constantly pessimistic doom-and-gloomer when it comes to Atari, this article could be hazardous to your view of reality.

Before we delve into details of the Falcon 030 and its capabilities, we must emphasize that what we saw was a pre-production module. Anything and everything we say here could change by the time the Falcon 030 is on the shelves (including the name).

General Overview

The Falcon 030 is planned as Atari's new low end model of a family of computers. As already disclosed on the major computer networks, the machine comes in a case almost exactly like that of a 1040STE. The only visual difference is the color—a dark charcoal gray that matches Atari's new monochrome monitor and the Portfolio.

As the name implies, the CPU at the heart of the Falcon is a Motorola 68030. The actual speed of the 030 was not disclosed as final, but the slowest a 68030 runs is 16 MHz. The machine will reportedly be available in several RAM options, with 14 megabytes being the top end.

All the standard ports you would expect to find on the machine are there—modem, printer, MIDI, etc. A true SCSI port can also be expected, as well as a High Density 1.44 meg floppy internal drive. Atari has publicly announced that all new machines will have HD drives and true SCSI support. The model we saw had a 2-1/2" (tiny!) internal hard drive as well.

Sound and Graphics

The sound and graphics capabilities of the Falcon 030 are impressive. The phrase heard most often from Atari representatives was "more colors than you can see and more sound than you can hear."

The graphics demos shown to developers were of a photographic quality that surpassed VGA on a PC or even the capabilities of an Amiga. While Atari gave no exact specifications, the graphics were definitely better than 256 colors would make possible. Reports that the Falcon 030 supports 16-bit color (32,000 colors) are probably right on the money.

Atari has confirmed publicly that the Falcon 030 supports "True Color." What this means is that there is no color palette on the Falcon. Instead, each pixel on-screen can be any color that the hardware can produce. You are not limited to only a handful of the possible colors. In contrast, the STE supports 4,096 colors, but you can only have up to 16 of those colors on-screen at one time. The True Color standard, which is gaining popularity on other platforms like the Macintosh, is a definite plus for the Falcon 030.

On the sound side, you get CD-quality stereo sound built into the system. It's probably safe to assume the Falcon 030 supports 16-bit stereo sound.

There are a few other surprises in the Falcon 030 that we can't discuss. The Falcon 030 is definitely going to be a big hit in the Multimedia, video and animation markets. Expect to see lots of high quality entertainment software as well.

The Bottom Line

As you can probably guess from the computer's enclosure, Atari plans to sell the Falcon 030 as a fairly low cost home computer system. Rumors abound concerning the actual retail price for these machines. While Atari has mentioned a couple of prices as possibilities, you will most likely see the Falcon 030 selling for well under $1000 US. Prices as low as $800 might even be realistic. "Incredible," you say? Time will tell. People will definitely be saying that "Power without the Price" is back in a big way.

Atari has also not announced an exact shipping date for the Falcon 030. It is reported that developers will begin receiving machines soon (if not by the time you read this even!). Expect to see the Falcon 030 available to the public before the end of this year. (That's right, 1992!)

Production and Marketing

Unfortunately, we can't tell you any of the specifics of Atari's production and marketing plans for the Falcon 030. Not because we don't know, but because Atari doesn't want us to spill the beans just yet.

The Falcon 030 is the most impressive machine for the home computer market that Atari has probably ever released. Their production and marketing plans reflect that they fully comprehend just how promising this machine is.

Atari has put into motion a plan that offers a great deal of hope for the future of the company, for Atari developers and for all of us as Atari users. While we can't reveal the details, we can assure you that the details are there.

Atari ST and 8-bit PD Disks $3 ea.

NEW! GAG Image Collection
Over 35 disks of great pictures for DTP use scanned by our members.

NEW!
LogoLibrary™

Time Savers!

LogoLibrary™ consists of over 1060 images for desktop publishing. Includes over 600 printer's logos for business advertising, stationery, disk labels, etc. In addition there are 460 symbols and graphics for charts, posters, shirt designs, signs, etc. All images are hi-res 300 dpi graphics in .IMG format for PageStream, Touch-Up, Calamus, Wordflair, etc. Includes 6 d/s disks and 72 page directory. $39.95

QUALITY AND SERVICE WE STICK TO IT
PIZZA

Categories include Animals, Astrology, Barbershop, Building Trades, Business, Cars, Farming, Food, Gas, Gifts, Holidays, Home Furnishing, Industry, Insurance, Landscape, Music, Pets, Religion, Real Estate, Services, Sports, Signs, Statistics, Symbols, and Travel.

Templicity™ LDW Users! VIP Users!

Home and Business Spreadsheet Templates

Now you can instantly use your spreadsheet to do your bookkeeping, income taxes, calculate mortgage rates, evaluate a car loan, estimate the maximum affordable price for property, balance your checkbook, design a savings program for education, create invoices, count calories, forecast income, and much more! This package of 104 ready-made spreadsheet templates covers everything from accounting and budgets to inventory and real estate. Interactive income tax templates are included and updated each year for only $5.00. Available in separate versions for LDW Power, Masterplan, and VIP Professional. $39.95

"Templicity is an excellent value and I highly recommend it." Amiga World, October 1990
"...a wealth of tutorial material..." ST Informer, Sept. 1988
"Templicity gives you ... a lot for your money." MACWORLD, August 1990

Qwikforms™
Forms and Layouts!
for PageStream™

The key to quick and easy, professional-looking forms and documents is Qwikforms™ --the only package of forms with over 100 different, adjustable layouts. Just choose the one you want, insert your name, logo, or text, and print. Business forms include invoices, inventory control, real estate forms, fax forms, job estimates, applications, organizers, ledgers, charts, and more. Page layouts include newsletters, menus, flyers, letterheads, business cards, brochures, booklets, envelopes, press releases, resumes, and video production forms. Legal forms include wills, deeds, claims, bill of sale, power of attorney, etc. Personal forms include announcements, cards, architectural symbols for home planning, mail lists, invitations and many other unique and unusual uses of PageStream. Includes 2 free disks of PD clip art and other useful desktop publishing accessories. $39.95

Your Company Name
PROJECT BID
Your Company Productions

Cliptomania™ 10 full d/s disks of hi-res PD clip art in .IMG format for use with PageStream, Touch-Up, Calamus, Wordflair, and any program that can read .IMG files. Categories include Advertising, Animals, Cartoons, Fantasy, Holidays, Letters, People, Restaurant, etc. Over 360 images! $39.95

With *Gemulator*, you can run your favorite Atari ST, MS-DOS, and Windows software on the same PC!

The screen dump on the left shows the monochrome ST desktop and several DOS and Windows programs, all running at the same time!

Now almost any 386 or 486 based PC clone can be turned into a virtually 100% compatible ST system!

From the people that brought you ST Xformer II and Quick ST 3.0...

Gemulator is a software/hardware combination that runs on any PC using MS-DOS or Windows with a 386 or 486 processor. Gemulator makes your favorite Atari ST software 100% PC compatible!

Now you can run your ST software *at full speed* on your PC at work or at school.
Share text files, pictures, spreadsheets, and databases between ST and PC software.
Multitasks ST software and PC software when used with Microsoft Windows.
Supports all 3 Atari ST screen resolutions and the STe's 4096 color palette.
Supports all versions of ST TOS (including TOS 1.0, TOS 1.4, and TOS 2.06).
Reads all ST disks, even Twisted disks and TOS 1.0 formatted disks.
Compatible with any PC mouse and VGA monitor.
Easy to install. All you need is a screwdriver.

Gemulator includes a board which allows you to plug in any version of TOS, from TOS 1.0, to TOS 1.4, to the new TOS 2.0. Two versions of TOS may be plugged in at once for improved compatibility with some ST software. You can even run two different ST programs at the same time, each one using a different version of TOS and running in a different screen resolution! Gemulator eliminates the need for having separate color and monochrome monitors and allows you to switch between color and monochrome modes without rebooting.

The following are just a few of the hundreds of Atari ST programs which can now run on the PC: **Pagestream, Calamus, ST Writer, Neodesk, Prism Paint, Flash, Tempus, Word Writer, First Word Plus, Degas Elite, Hotwire, Multidesk, Maxifile, GDOS, G+PLUS, Quick ST, Turbo ST, Word Flair, LDW Power, EZ Calc, Madmac, GFA Basic, Sudden View, and Laser C.**

AIM Mac/Spectre Disk of the Month

Each AIM Mac/Spectre Disk of the Month is a double-sided disk packed with some of the best PD and Shareware programs available each month. The disks are available in either Macintosh or Spectre formats. All files are self-extracting Compactor Pro archives. Just double click to extract!

Here is a short description of the files contained on the May '92 Mac/Spectre Disk of the Month:

Disinfectant 2.6—Disinfectant is the premiere Macintosh virus detection and eradication program. It features its own built-in help file which includes a rather extensive section on different Mac viruses. It also includes an option to install a protection init to guard your system from future attacks.

There is a new virus infecting the Mac community called MBDF-A. This virus was first detected in Wales and was later discovered on Internet hiding in a couple of games. The games are "Ten Tile Puzzle" and "Obnoxious Tetris". In addition to these two games, another game called either "Tetricycle" or "Tetris Rotating" has been found to be a Trojan horse that installs the virus. As far as anyone can tell MBDF-A is not destuctive. It does, however, make changes to the System file and seems to take such a long time writing itself that many people reset their computer thinking it's hung. If the reset takes place while the System file is being written to, it will cause the file to be damaged. If this happens, your only option is to reinstall your System files.

Disinfectant combats this, and many other, Mac viruses. We encourage you to use this program to scan your Mac disks. In addition, if you happen to have any of the games listed above we strongly suggest you get rid of them as quickly as possible. You'll be doing yourself, and everyone else, a big favor.

Z-Term 0.9—This archive contains the latest version of a very popular shareware Macintosh terminal program. Z-Term 0.9 contains just about every feature you could want including auto dialing/redialing, macros, logon scripts, ascii capture, X-modem, Y-modem (including batch), Z-modem and CompuServe Quick B protocols.

ASCII Chart 4.2—This archive contains a very useful desk accessory that allows you to view every character in the current font set at one time. This includes all those special characters you can never remember how to make. You simply move the mouse pointer to the desired character and click. ASCII Chart will display the key combination needed to produce that character. There are many more features in this great DA.

miniWRITER—This archive contains the latest version of a great text processor desk accessory. As the name suggests, miniWRITER is small. But don't let that fool you. This DA has become a must have for many Macintosh users. It's great for jotting down notes while working on your computer.

MICN—This archive contains an init/CDEV that replaces the text in your menu bar with icons. Just the thing for cutting some of those long menu bars down to size. The CDEV comes with its own set of menu words and icons, but you can add your own words and icons to the list. It even has a built-in icon editor.

World Time—The CDEV in this archive can display the time and date for a number of cities around the world. You can even add your own cities to the list. World Time takes into account whether it's daylight savings time or not when making its time/date calculations. This useful little control panel device will also adjust your Mac's clock automatically for daylight savings time or standard time as needed.

Kidpix—This archive contains a cute drawing program for kids. It was designed to be easy to learn and use. There are no complicated key sequences to remember and parents can choose to disable the menu bar so desk accessories can't be run. All documentation is included within the program.

Slime Invaders—This archive contains a game which is somewhat like space invaders except that you're fighting slime and toxic waste (yum) rather than aliens.

Macman—This archive contains a very good clone of an old arcade favorite. There are some differences, though. In this version you can choose to make Macman invincible! There are lots of other features as well, such as being able to run the game in slow motion, etc.

Readers can purchase this disk by sending $6 ($5+$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, or call (313) 973-8825 and have your Visa or MasterCard ready. Please specify the May '92 Mac/Spectre Disk and which format when ordering.

AIM

ST/Mega/TT

Disk of the Month

All files on this disk are self-extracting archives created with Double Click's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the May '92 disk. For more complete docs, see the text files contained in most of these archives.

ALICE_12.APP—Version 1.2 of the Alice text editor. Alice stands for Another Little C Editor, is fully GEM-based, supports multiple windows and lots more. Written by Ralf Kaufman of Germany.

BOBBLE.APP—Bobbles is a great game of Tetris with a twist. Arrange the jewels into rows of three to clear them. Great graphics and very playable. Novice, Easy and Arcade levels. Created with GFA Basic using the GP libraries available from DSA. Low rez ST color. Runs great on TT in ST low rez.

CAMELS.APP—Revenge of the Mutant Camels, a fast paced arcade game. One or two player. As a mutant camel, you have to run the guantlet and get to the oasis. In two player mode, you take along your trusty goat friend who doubles as a gun turret. Beware the skiing kangaroos, evil walking sticks and lots more. Low rez ST color. Works fine on TT. Shareware from the UK.

DD10BDMO.APP—Demo version of Double Click's Data Diet! Data Diet is a great commercial realtime compression/decompression program that can save you up to 50-60% of your hard drive's capacity. Using Data Diet is like buying a second hard drive.

FB_BNS09.APP—Basic Natural Science version of the Fleabyte accessory. Fleabyte is a calculator desk accessory that can automatically export its results into any standard GEM window. Fleabyte/BNS supports unbalanced chemical equations, as well as many other "standard" calculator functions.

MPMODS1.APP—A package of external modules for MegaPaint Professional from CodeHead Technologies. Included are import modules for TNY and PC3 pictures, a menu bar module to get at your DAs, a module to call MaxiFile III, and a module to call Wiz Works! ScanLite software to allow scanning directly into MegaPaint with various hand scanners. Also included is a program to let you change some module parameters and a READ_ME file explaining how to set up and use the modules. You must have MegaPaint to use these modules.

MPMODS2.APP—Another set of external MegaPaint modules. This batch contains import modules for Calamus Vector Graphics (.CVG), Calamus Fonts (.CFN) and full pages printed TODISK from within Calamus. MegaPaint is required to use these modules.

MSPACMAN.APP—A great Ms. Pacman clone. One or two players (Player 2 gets to chase Ms. Pacman as the red ghost). Lots of fun. Created with GFA Basic using the GP libraries from DSA. Low rez ST color. Runs fine on the TT.

SELCTRIC.APP—Selectric 1.0 is a feature-full replacement file selector for theST/STE/TT. A nice interface, with many options and controls. Includes a desk accessory to call the file selector from within any GEM program. Shareware from Germany.

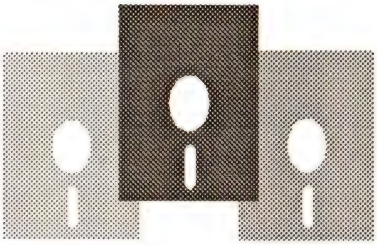
TLC_ATTR.APP—The Attributer runs as a program or accessory in color or mono. It allows changing file attributes (hidden, read-only, system, archive) as well as updating the date/time stamp and setting the fastload bit for TOS 1.4. It also allows deleting those pesky files that won't delete, changing filenames and disk volume labels. Shareware from TLC Software.

TLC_BOOK.APP—The TLC Address Book Version 2.01 has custom GEM editing routines, hot keys in all the dialog boxes, variable page and label size, and various other added features. This is the must-have version! Prints labels for addresses, occasions (birthdays, anniversaries, etc) by month or year, address book pages, date book pages by month or year, etc. It even allows multiple printing of one address (great for return address labels). Configureable for any printer. Shareware from TLC Software.

TLC_SHOW.APP—A simple viewer for compressed or uncompressed Spectrum pictures. No fancy slide shows and not a lot of parameters to worry about, just choose a picture then press a key. Great for quick viewing of Spectrum pictures. Color only. Shareware from TLC Software.

TRIPLES.APP—A Concentration clone. Match three of a kind to clear squares and reveal parts of a picture puzzle. Solve the puzzle to win the round. One to three players. ST low rez color only. Works fine on the TT.

Readers can purchase this disk from their local AIM Participating user group or by sending $6 ($5 + $1 S/H) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108 or call (313) 973-8825 and have your Visa or MasterCard ready. Please specify the May '92 ST/Mega disk when ordering.



8-bit (Classic) Disk of the Month May 1992

Each AIM 8-bit Disk of the Month is a single-sided, single density "flippy" packed with software. To extract files in the ARC format, you need the UNARC .COM utility. To decompress files with a DCM extension, you need DISKCOM3.UTL. Both programs are available from most BBSes, user groups or you can purchase the April/May '91 AIM 8-bit Disk.

Here's a short description of the files on the May '92 8-bit disk:

Side 1

CGS091.ARC—Color Graphics System written by Tom Hunt. Lets you view online graphics while connected to a BBS supporting CGS. Works with BobTerm and possibly other packages. RAMdisk or hard drive required.

DASOMEN.DCM—The Das Omen demo from Germany. Use Discomm to uncompress, then reboot. Press 'A' to begin the demo once A:DAS OMEN appears on your screen.

Side 2

DIRPRINT.ARC—Diamond GOS Directory Printer accessory written by Kevin Packard (WNYAUG). Dumps DOS 2.x compatible disk directories to printer from within practically any program. Requires Diamond GOS cartridge from ReeveSoft.

MATRIX.ARC—A utility to help you create alternate character sets. The program presents a character matrix on-screen and lets you fill in dots. Then, Matrix prompts you to press the key of the character you wish to replace. Character data can be saved to disk. BASIC program.

FNTDSPLR.ARC—Font Displayer lets you preview your font library by displaying font names from disk in their actual fonts. A great shareware utility from Steve Walker (ACCD).

FONTLIB.ARC—In case you don't have many standard 8-bit fonts for use with Font Displayer (and other programs, of course), here is a library of over 70 fonts! Lots of great fonts.

Readers can purchase this disk from their local AIM participating user group or by sending $6 ($5 +$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108 or call (313) 973-8825 and have your Visa or MasterCard handy. Please specify the May '92 8-bit Disk when ordering.

HARD DISK SOFTWARE SPECIAL!
Protect your data, speed up your disk, and extend the life of your drives!

Spring Cleanup

$49.95

ATARI®
NEW Version

Hard Disk Sentry
Get the best-selling disk optimizer and speed up your hard disk's performance. It works with all Atari ST/STe/TT compatible hard disk formats, including the BGM format, using any size partitions. Use Hard Disk Sentry to diagnose and repair common - and dangerous - disk problems. Works on floppies and Syquest drives too! New features include progress bar graphs; graphical disk map; scrollable window for diagnostic messages; and more.

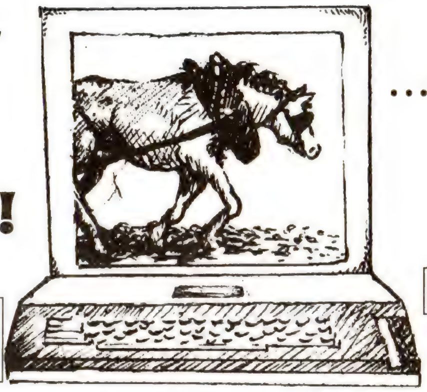
Make your 8-bit a Workhorse!



...with power products from Computer Software Services

Power Products for your XF551

$99.95 THE XF SINGLE DRIVE UPGRADE $99.95

Double the storage capacity of your XF551 with our 3.5" 720k **single drive upgrade!** Included with the upgrade is a Sony 3.5" disk drive in a 5.25" faceplate that perfectly replaces the existing 5.25" drive. The 3.5" drives are newer technology, more reliable, and easier to handle. Do NOT confuse this with public domain upgrades! The completely re-written drive OS adds these features:

- **Fixes incompatibilities** with commercial software
- **Eliminates** density **reconfiguring problems**
- Switches to second side without reconfiguring
- **Ultra Speed** I/O compatible
- Very **high speed** sector skew in US mode
- Capable of reading **IBM** and/or **ST** disks
- Compatible with 40 OR 80 track drives

Included with the upgrade is a utility program capable of reading IBM and/or ST disks, so you can import text or binary files to your 8-bit (text conversion routines are included). Minimal soldering is required; but we provide free installation for any of our products! Only $99.95 plus $8 S/H/I. If you already have a 3.5" drive, you may obtain the single drive upgrade without the Sony drive for $59.95 plus $5 S/H/I.

$139.95 THE XF DUAL DRIVE UPGRADE $139.95

Our XF Dual drive upgrade allows you to **add** a 3.5" drive to your XF551, while keeping the 5.25" mechanism. This is a totally **switchless** upgrade that turns your XF into two disk drives! The added 3.5" drive assumes the next drive number higher than the 5.25" and is totally independent, so you can copy between drives, even mixing densities! This product has all of the features of the above single drive upgrade, available for **both** drives! Complete with Sony 3.5" drive, only $139.95 plus $8 S/H/I. The upgrade without the drive is $79.95 plus $5 S/H/I. A special version to handle dual 3.5" mechanisms is available for an additional $20.

THE FLOPPY BOARD $109/149

The Floppy Board has arrived! This long-awaited Black Box add-on has been in the making for quite a while, but we've packed it with features that are worth the wait! This sophisticated device allows connection of up to four 5.25" or 3.5" floppy drives (drive sizes may be mixed). Access to these drives will be at parallel bus speed, approaching that of hard disks!

The board consists of 13 special integrated circuit chips, fully powered by the power supply of the Black Box. It has its own on-board microprocessor to take the load off the computer's processor for disk I/O. The board and fits perfectly over the Black Box (inside the custom cases!). It is not a stand-alone device; it must be used in conjunction with the Black Box.

High density disks are supported, so 1.2 meg 5.25" and 1.44 meg 3.5" drives may be connected. This is the only 8-bit controller to fully support these drives and densities! With four 3.5" 1.44 meg drives connected, you can achieve more total storage than a 5 meg hard disk! Archiver compatibility is supported! This means you can back up those titles no longer available. Although it's not as powerful as our Super Archiver, it will have the same editing power, with good backup capability.

Software included with the Floppy Board includes a utility to READ and WRITE IBM and ST disk formats! This will yield the easiest possible way to port text and data files between your 8-bit and ST or PC! This will be compatible with most all of the current formats. Also included is a high-speed sector copier designed to make extremely fast, verified copies of disks. A future upgrade to the Hard Drive Pro Backup (our hard disk backup tool) will make special use of the floppy board, and squeeze even more data on each disk than standard formats allow. It is possible to actually store 1.6 megs of data on a 1.44 meg 3.5" drive, so backing up a full 20 meg hard disks might only take 14 disks! Usage of the Floppy Board's on-board processor will allow overlapping reading and writing, making the backup really fly.

Two versions are available: the basic unit, and the Deluxe version. The basic unit provides the interface necessary for low density drives (360k for 5.25" and 720K for 3.5"), and comes with the IBM/ST transfer utility. The Deluxe version adds the high density capability, adds Archiver compatibility, AND adds the features of the Black Box Enhancer, which include a high-resolution 16 grey scale printer screen dump, and a powerful built-in sector editor, disassembler, and copier (which accesses the full 16 megs possible of hard disk partitions, and uses all available extra memory). Note: the Floppy Board replaces the ROM on the Black Box, so current Black Box Enhancers cannot be used with the Floppy Board.

The basic unit is only $109.95, and the deluxe unit is only $149.95. Add $5 for shipping/handling.

Power products for your XL/XE computer

~~$69.95~~ THE ULTRA SPEED PLUS OS ~~$69.95~~

The Operating System that should be in every XL/XE computer! The **ULTRA SPEED PLUS** puts unbelievable speed and convenience at your fingertips. After using it a while, you'll wonder how you ever got along without it! Use **ANY DOS** to place **ULTRA HIGH SPEED** formats on your disks (with XF551 or modified 1050 drives), reconfigure and boot any drive (1-9 or even your **RAMDISK!**), sector copy single and double density disks to your RAMDISK, activate a built-in **400/800 OS** for compatibility, and much more! Below are a list of features. Only $59.95 + $5 S/H/I.

- **ULTRA SPEED SIO** for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from RAMDISK
- Special timer circuits not required for 1 and 2 megs
- Background colors adjustable
- Reverse use of **OPTION** key
- Toggle internal **BASIC**
- Built-in drive number editor (including RAMDISK drive)
- Toggle screen off for up to 40% increase in speed
- **DOUBLE DENSITY RAMDISK** handlers
- **ENTIRE MEMORY TEST** that pinpoints defective RAM chips
- Boot any drive (1-9) on cold start
- Supports ALL XE-compatible memory upgrades up to **two megabytes**
- **THREE** Operating Systems in one **(XL/XE, 400/800, ULTRA SPEED PLUS)**
- **COLD-START** without memory loss
- Built-in mini sector copier
- **RAMDISK** exactly duplicates floppy drive so sector copying and editing are possible

$199.95 THE BLACK BOX $199.95

The **BLACK BOX** is a parallel-port device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It is a T-shaped board with two buttons, two switches, and a set of dip switches visible from the outside. The **BLACK BOX** performs three main tasks: interface to a SASI/SCSI bus (for interface to most common hard disks), a parallel printer port, and a RS232 (modem) port. You may partition your hard disk(s) into as many drives as you wish; up to 9 may be active at any given time. By pressing one of the buttons on the **BLACK BOX**, you will enter the configuration menu, where you can re-assign drive numbers, swap partitions in and out, etc. When you exit, you will be returned to your program – undisturbed! Each hard disk partition has its own write-protect flag, and may be set to single or double density. Every hard disk may be write-protected with the flip of a switch. As an option, you may use your computer's XE RAM as a printer buffer, or order the BLACK BOX with 64K of on-board RAM.Another amazing feature of the BLACK BOX is the built-in **screen dump**. By simply pressing a button, the contents of your screen will be dumped to your printer! (You can define text or graphics modes with a switch!) The RS232 port supplies the full spec signals for added compatibility. Its handler takes up no user memory, and can handle 19,200 BAUD! A **machine language monitor** has been added to allow memory disassembly, memory/register changes, and more. The basic **BLACK BOX** unit is $199.95, and $249.95 with 64K RAM (for printer spooler). S/H/I is $8. An optional custom BLACK BOX case is available for $39.95. The Black Box is a product of Computer Software Services... Not the Black Box Corporation.

HARD DISK SYSTEMS

We offer complete, ready-to-run hard disk systems from 5 megs on up! These systems include a hard disk, Black Box, power supply, controller, cables, and software. Everything is pre-formatted and tested, so all you have to do is plug it in and boot! Prices start as low as $399. Call for the latest prices and specials!

INSTALLATION AND REPAIRS

Althoough installation of any of our products is easy, by taking advantage of our free installation offer, you can rest assured it will be done right. All you pay is the freight charges.

For repair of Atari 8-bit computers and drives at reasonable rates, contact our repair department at (716) 429-5639. All work is guaranteed, and there are no minimum estimate fees.

TWO FOR ONE DEAL!

If you have two or more of the same items needing repair and don't want to spend any money... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE - we'll keep the other defective one for parts! Please call before sending anything in.

We carry many other items - call for our FREE catalog!

Dealer/Distributor/User Group discounts available–call for info.

We accept VISA and Master Card. NY Residents please add sales tax.

Charles Kelly, Ellen Lentz, Jeff Wells

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs are preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari TT/030, HP Laserjet II with PacificPage PostScript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.

Editorial Ramblings

We've heard recently that Atari Explorer is about to be moved "in-house." John Jainschigg has shared with us his thoughts against moving out to Sunnyvale (into what some have called "the pressure cooker"). It is his decision to not accompany Explorer to Atari Corp. He will do only one more issue from New York.

As you may remember, John pulled Explorer out of the ashes after middle managers at Atari Corp. "fired" Betsy Staples and David Ahl. John kept improving Explorer, while STart folded, making Explorer the "flagship" of Atari-specific magazines. Explorer is the only other Atari-specific magazine next to AIM on bookstore shelves. Explorer is also the only glossy left in this market.

We feel Atari execs are making a bad decision by moving Explorer to Sunnyvale. It is very possible that Explorer won't last long in the political tug-of-war at Atari. If Explorer ceases publication, it will be a very sad day for all Atarians. It will be taken as a sign that even a glossy magazine supplemented by Atari itself can't make it any longer in the ever-shrinking Atari computer market.

Some may say Explorer's death would help AIM and other magazines. This is not true. Each time an Atari magazine dies, the market convulses; developers decide to move to other platforms; users decide, since they can't find an Atari magazine at a local bookstore anymore, to move to other computers.

We wish both John Jainschigg and Atari Explorer a long and prosperous life.

From The Reader's  Viewpoint

Atari Classics Campaign

My name is Roger Meston and I am the 8-bit librarian for the P3-ACE user group. If you have some time, would you address your feelings and concerns about the attempt by Jeff McWilliams to create a separate 8-bit magazine, presumably against your will?

The people in the club are rather divided over the ramifications of this attempt, but we don't even know if you wish to resist or whether you think it's a good move.

I for one feel he is off-base somewhat. I have been a dedicated Atari supporter since 1979, when I bought my first Atari 800. With an 810 disk drive, tape drive and one program, the bill came to around $1700, which is crazy by today's standards.

But I have never regretted buying it (I had to re-enlist in the US-AF to buy it with my re-up bonus). As I look back on my career, that was the one crucial decision that took me out of hands-on electronics repair and into the wonderful world of computers, space and all out technology stalking.

I've flown multi-gazillion dollar satellite systems, helped develop and deploy the GPS Navigation system, and handled some of the most incredible multi-media stuff you could imagine. I really feel that I owe it all to that one decision to buy an "over-priced video game."

I've said all that to say this—I really feel the remaining 8-bitters must, absolutely must, stop this ridiculous self-separation and join with the STers and kick the PCs butt! Ok, maybe not, but at least we should use the darn thing to improve our lives, enjoy using it, learn from it and knock off the stupid crap.

I have been following the 8-bit and ST Fidonet feeds for a while and some of those people are nuts! Whew, we gotta chill out. Anyway, I feel separating out the 8-bit stuff from the ST stuff will not help anyone.

Your publication is absolute genius, and it is an asset for 8-bit owners not to be segregated out. Delineating the platforms will just drive the wedge deeper between "family" members.

I own both, and I would not trade either machine off for anything. I don't favor one over the other as they both have different strengths. The ST has the big power and the pretty face and the 8-bit has affordability and access to zillions of programs. Regular people can get these machines and learn from them, grow with them, and enjoy it all. Man, I just love 'em!

Ok, I'll take my own advice and chill out (puff, pant, whew). Now where was I? Oh yeah, keep your great magazine just the way it is. You have achieved a fine balance between grass roots and high tech. Keep up the great work.

Thanks for listening.
Roger Meston

Dear AIM:

I recently became aware of an effort, headed by Jeffrey McWilliams, to start an 8-bit only magazine. As an avid 8-bitter, I was immediately interested. But what I read in Mr. McWilliams' information kit really disturbed me. His plan is not to just start a new magazine, but to petition AIM to split into two separate magazines.

There are just not enough developers and advertisers to support two separate magazines. Think of how many 8-bit only/16-bit only publications have gone under in just the last year.

Several times Mr. McWilliams implies that this new magazine of his is our last chance to keep the 8-bit alive. I say it would surely be the beginning of the end of our great support from AIM, and possibly the beginning of the end for AIM as well.

Bill and Pattie, I implore you, *do not* be persuaded to mess with your find, well-established publication.

Mr. McWilliams, if you really think you can make an 8-bit only publication fly, go for it. I'll buy it. But don't gamble with the future and quality of AIM to try and pull it off. If you have a base of writers, programmers and advertisers, we would all be ahead if you would encourage them to contribute to AIM. One strong publication is always better than two weak ones.

Paul Alhart
Lompoc, CA

Paul and Roger, having only just received a copy of the actual kit ourselves, we can see why we've gotten a number of responses from people who are against the Atari Classics idea as it is being approached.

Here's basically where we stand on all this. We are very supportive of the 8-bit market and any efforts to help that market survive. Jeff McWilliams, Ben Poehland and others behind the Atari Classics magazine campaign believe the 8-bit market needs some rallying place for developers and users. We agree wholeheartedly with that.

They believe this rallying place must be a national, professionally produced, 8-bit only magazine. While we don't agree 100% with that assessment, we would definitely give our support to such a publication if enough 8-bit owners out there also showed their support by indicating their willingness to subscribe. The recent write-in campaign run by Jeff McWilliams and Ben Poehland was designed to gauge how much support is really out there for their proposal.

Recent reports from Ben Poehland indicate they received over 500 *responses from people stating they would be willing to pay $25/yr for such a magazine. This 500 "target" was arbitrarily set by the people behind Atari Classics. While this might be a feasible number for a small, US-only magazine, a fairly large number of those people responding were outside the US.*

When Jeff McWilliams says in the kit that it would be "a little more" than $25 for non-US subscribers, he's being a bit misleading. It could actually cost close to twice *that amount, since Printed Matter mailing rates for a magazine like AIM comes close to $2 per issue to some countries.*

A magazine "like Atari Interface" would not be feasible at those kinds of numbers, even if it was only US-based. At least a couple supporters of the campaign have indicated to us they will only settle for a magazine that is nationally distributed to bookstores, like AIM. That's just not a feasible reality.

Regardless of what the kit from Jeff McWilliams indicates, Atari Interface is most definitely not *going to "split off what little 8-bit coverage it now offers" to create Atari Classics. In fact, they did get it right in the kit when they said AIM would "continue serving the 8-bit community as long as 8-bit users express interest."*

We have heard a lot of other people's opinions on this matter. Some are very *supportive of the separate publication idea. Others want us to persuade Jeff McWilliams and his helpers to focus their support into Atari Interface. We have not attempted to persuade Mr. McWilliams (or anyone else) to start, continue or abandon this effort. We also have nothing whatsoever to do with the form or substance of the campaign. We only indicated our support for the broad ideas on which the campaign was based.*

If, however, the Atari Classics people think Atari Interface is going to become an ST-only publication while they put together Atari Classics and we publish that magazine for them, they're wasting a lot of everyone's time.

We believe, as AIM illustrates, that it is better to have more interaction between ST and 8-bit owners, not less. We believe it is better to treat ST and 8-bit owners as equals rather than act as if neither exists in the same reality. We will not turn our backs on that belief just because the Atari Classics people think otherwise.

If the 8-bit community decides it's in their self interest to have an 8-bit only magazine and the Atari Classics people can get enough subscribers to pay for such a magazine, then we will do what we can to help make the publication a reality. But we will not sacrifice Atari Interface and abandon its 8-bit supporters in the process.

You can be sure we will continue to support the Atari 8-bit market in AIM as long as people like you support us. We currently have more 8-bit article submissions coming in each month than ever before and our 8-bit Disk of the Month is doing very well.

Bill & Pattie Rayl

Why Switch?

As summer approaches, and Atari Corp. has once again failed with many of their promises, I hear many of my friends talking about switching to IBM or some other computer...

IBM, with all it glitz and glamour, seems to be the computer of the future...but is it really what anyone really needs?

Definitely not!!!

So many people get caught up in this keeping up with Jones's syndrome. Before you think about switching computers due to Atari's lack of customer support, ask yourself a few simple questions. You may be very surprised at your answers.

What are *my* needs for a computer? Most people will choose either word processing or playing games. Can an IBM do word processing better than your Atari? Certainly not! Can it play games better? Nope. Can your Atari do these things satisfactorily for you? Yes, but.... *but what?* But the IBM has so many new things coming out for it all the time...

Ah HA!!! Now we have gotten down to the real bottom line as to why you might consider switching computers...the IBM has more new stuff coming out all the time. If it wasn't for this fallback, you would be perfectly happy with your Atari, right?

Now is the chance for you to make a difference and make Atari know how you feel. Most all of us are in sincere agreement that we love our Atari's and would never switch if Atari would just start listening to our wishes.

The Solution: Write to Atari Corp., Attention Jack Tramiel, Sam Tramiel and Bob Brodie. Send *each* of these three a copy of your letter. Tell them in no uncertain terms that if they don't wish to lose their loyal Atarian following, they need to bolster their support, in both hardware and software, for both the 8-bit and ST line of computers. Tell them we are tired of waiting, and we want action *now!!!*

If each and every Atarian in the US would take the time to write to these guys and tell them this, maybe we would start seeing more support here in the US instead of watching it all going overseas. The time to act is now, and if *you* don't do it, you are not a true Atarian. *do it!* We can make a difference!

Write: Atari Corp., 1196 Borregas Ave., Sunnyvale, CA 94089-1302

ATARI BULLETIN BOARD

Atari Corp. News

The major news this month was Atari's losing its $160 million antitrust case against Nintendo. Atari had filed the suit alleging that Nintendo's licensing agreements with video-game publishers constituted unreasonable restraint of trade. Atari claimed Nintendo had used its monopoly power to force independent software companies to agree to keep hit games from competitors like Atari, and to provide the games exclusively to Nintendo.

The jury found that Nintendo did not have any intent to monopolize the U.S. home video-game market. However, the jury found that Nintendo did have monopoly market power. The nine-member jury, following an 11-week trial, found that Nintendo's video game licensing program had not caused Atari any damages.

The jury was unable to reach verdicts on the question of whether Nintendo's licensing agreement was an unreasonable restraint of trade, or whether this program was the means by which Nintendo acquired monopoly power.

"We are disappointed the jury did not understand the negative impacts Nintendo's exclusive contracts had on competition because of Nintendo's power over its suppliers and customers," said William Jaeger, an attorney representing Atari. "The consumer also loses from this result because the antitrust laws have worked very effectively to maintain a strong competitive environment with lower prices and better choices for consumers," Jaeger said. "This decision will seriously weaken those vital laws."

The judge decided Atari also has to pay Nintendo's legal fees, something in the "six or seven figure range," according to Nintendo. Atari's subsequent appeal was denied.

MetaDOS

Atari's Bill Rehbock has announced that the current version of MetaDOS is available for developers to distribute free with their products. MetaDOS comes with a driver for the CDAR-504 and a driver for any Sony CDU-541-compliant drive connected to a TT. This includes the popular Chinon CDX-431, the NEC CDR-36, 73, and 83 as well as the Macintosh CD-ROM drive.

Anyone interested in connecting a CD-ROM drive to an older machine should contact ICD or BMS.

Developer News

CodeHead Technologies, under their Working Title US subsidiiary, has released Calligrapher Professional and Calligrapher Gold.

Calligrapher is a feature-packed document processor combining some of the best capabilities of word processors and DTP packages.

The CodeHeads are offering a special trade-in discount to owners of other Atari word processors—just send in your master disk for any one of these programs:

Word Writer
Word Perfect
WordUp
Wordflair
Regent Word
Microsoft Word
1st Word Plus
Signum
That's Write
Write On

and you'll get a $35 discount off Calligrapher's normal price. (You'd get Calligrapher Professional for $140 or Calligrapher Gold for $215.)

PostScript output support is included as a standard feature of either version! Calligrapher Gold adds such features as the ability to place text along a user defined path (FlexText), a grammar checker, thesaurus and barcode generator.

Calligrapher Professional and Calligrapher Gold each include ten outline fonts.

If that's not enough, there's an entire library of 60 high-quality outline fonts available from CodeHead Technologies. Font disks are $34.95 and each disk contains one main typeface (e.g. Garamond, Bold, Italic and Bold Italic).

Calligrapher uses G+Plus (like GDOS) so you are not required to purchase any of these fonts. You can use any GDOS-compatible font with Calligrapher.

For more information, contact CodeHead Technologies, P.O. Box 74090, Los Angeles, CA 90004, Ph: (213) 386-5735, FAX: (213) 386-5789, BBS: (213) 461-2095.

ISAC Board Sale

Dover Research is now selling the ISAC graphics card for $299.95! If you use an Atari Mega ST2 or 4 for desktop publishing or CAD, you will *love* this card. ISAC delivers 1024x768 resolution with 16 on-screen colors.

Dover's Jay Craswell can't promise how long this will last, so get your order in *now*. This is a direct sales deal only from Dover Research. Call (612) 492-3913.

Upgrades Easy as ABC

ABC Solutions is now offering the K-Spread 4 spreadsheet in North America. KSpread 4 offers extensive spreadsheet and presentation capabilities with GDOS output. The Surround Rectangles function enables the user to surround cells or blocks of cells with boxes. By using these boxes, tables and forms can be designed, and shading can be used for added impact. Text can be added in a variety of fonts, styles and sizes. You can use this capability to design self-calculating forms, such as invoices or quotations.

In addition to the presentation features, KSpread 4 includes over 50 convert functions and more than 20 time & date functions in addition to extensive database, financial, logical, statistical and string functions. Date calculations, sorting, user defined functions and extensive macros (generated by either learning or programming) are among the features of this package. Lotus WKS and WK1 files can be loaded and saved directly, without the need for a conversion program, as can DIF and ASCII files. K-Spread 4 costs $169 US ($199 CAN).

Also available is K-Spread 4 Lite, with all the features listed above except Macros and the GDOS features. It is fully upgradable to the full K-Spread 4 program. K-Spread 4 Lite sells for $89 US ($99 CAN).

Owners of A-Calc, A-Calc Prime or any version of K-Spread may upgrade to K-Spread 4 by sending in your master disk and a check or money order for $79 US ($89 CAN). To order, send check or money order to ABC Solutions, 4040 Creditview Road, Unit 11-151, Mississauga, Ontario L5C 3Y8 or call (416) 824-8484.

PageStream Offer

Soft-Logik Publishing has announced a special PageStream upgrade offer for owners of other Atari DTP packages. Owners of any other Atari desktop publisher can upgrade to PageStream 2 for only $120. This offer expires on August 31, 1992.

To take advantage of this offer, send the following to Soft-Logik:

- Atari DTP manual title page (any Atari DTP program, but no photocopies)
- Your original program disk OR a photocopy of a disk or registration card showing your registration number
- Your name, address, telephone number
- The upgrade fee
- $5 for shipping ($15 outside of USA and Canada)

Upgrading from Publishing Partner is $100, and upgrading from any version of PageStream is $75. PageStream owners can easily upgrade over the phone. PageStream 2 retails for $299.95. Contact Soft-Logik Publishing at 11131 F South Towne Square, St. Louis, MO 63123, (800) 829-8608 or (314) 894-8608, FAX: (314) 894-3280.

Portfolio News

Atari has released a new software application for the Portfolio handheld computer. Hyperlist is a unique filing system which revolutionizes the way data may be organized in the Portfolio. Often described as an "outliner" or "database," Hyperlist provides the opportunity to create extensive lists, then attach "child" lists to each item in the "parent" list. On paper, the data flow resembles an organizational or flow chart.

"This new system on the Portfolio opens many doors of opportunity", states Donald A. Thomas, Jr., Portfolio Marketing Manager at Atari Computer Corp. "The software is easy to use, powerful and flexible all at the same time." Specific target markets include education, sales, medicine, law and just general purpose.

Hyperlist retails for only $49.95. For more information on the Portfolio and its applications, contact Don Thomas, Portfolio Marketing Manager, 1196 Borregas Ave., Sunnyvale, CA 94088, (408) 745-2000.

An on-line newsletter called Palm To Palm is available from Perfection Applied for those new to palmtop computing or those that have a palmtop future. It's available in the PALMTOP and APORTFOLIO Forums on CompuServe.

For palmtops users that want tips, tricks and help, Perfection Applied offers Take It With You, a bi-monthly newsletter for palmtop computing. Subscriptions to Take It With You are $18 a year. Send check, money order or cashier's check to Perfection Applied, 454 West 1010 North, Orem, UT 84057, ATTN: Palmtop newsletter.

People looking for a carrying case for their Portfolio may wish to check out Ultrasoft's deluxe case selling for $29.99. The case is described in their catalog as "black polyurethane outer shell, water-proof, reinforced wrist strap, nylon zippers, size 8.8 by 5.8 by 2.5." The main section holds the Port and spare batteries. An auxiliary compartment has document pouches, RAM-card pockets, and pen and business card holders. A pocket in the auxilary section adds space for a parallel interface and cable. To order, call (514) 487-9293 or write Ultrasoft at One Transborder Drive, PO Box 247, Champlain, NY 12919.

Upcoming Atari Shows

The 1992 Blue Ridge AtariFest will be held at the Westgate Shopping Center in Asheville, NC on July 18th from 10am to 6pm. Take any major highway into Asheville (US-19/23, US-26 or I-40) to the I-240 loop, then take the "Westgate/Hilton Inn Drive exit" into the Westgate Shopping Center parking lot. For more information, contact Van Estes (BRACE Pres.) at (704) 685-8358 or Sheldon Winick (Computer STudio) at (704) 251-0201.

The fourth annual MIST Atarifest will be held on Saturday, July 25. The show runs from 10am to 5pm and will be held at the Castleway Conference Center at 6385 Castleplace Drive, Indianapolis, IN. This air-conditioned location on the north side of Indianapolis has ample parking and is close to several major highways, many fine restaurants and hotels, and the largest mall in Indianapolis.

Public admission is $3 and includes a raffle ticket to win one of the many hardware and software items donated by attending vendors and developers. Vendors may purchase booths (8x8) at $50 each. User groups may purchase booths for $10 each. Only a limited number of user group booths are available. For more information, contact Dan Ward via GEnie at (D.WARD10) or give him a call at (317) 254-0031.

Weekend Shows

Several Connecticut Atari user groups are joining forces to stage a two-day show later this year in Hartford, CT. The event is scheduled for August 15 and 16 at the Sheraton Hotel at Bradley International Airport, Windsor Locks, CT.

The show showcases the latest Atari products and services and includes seminars on desktop publishing and video production, hands-on instruction from manufacturers and software developers, MIDI demonstrations, giveaways, 8-bit support, a swap room and much more.

For more information about Connecticut AtariFest '92, contact Brian Gockley at 18 Elmwood Avenue, Bridgeport, CT 06605, (203) 332-1721 or Doug Finch at (203) 637-1034.

The Washington Area Atari Computer Enthusiasts are currently planning WAACE Atarifest '92 for October 10th and 11th at the Sheraton Reston Hotel in Reston, Virginia.

When you're looking for late-breaking Atari news, honest product reviews and articles written by users just like yourself, look no further than *Atari Interface.*

Unique in the market, *Atari Interface* also serves as an official newsletter for 100+ user groups in the US, Canada and the UK!

Also, check out our ST/Mega, Mac/Spectre and Atari 8-bit Disks of the Month for the very best PD and Shareware software available each month!

David Plotkin
Contributing Editor

I've been reading about Double Click Software's newest product, Data Diet. What it does, essentially, is automatically compress your data when it is saved to disk, and decompress it automatically when that data is loaded back in from disk. This can result in a significant savings in disk space, enabling you to save much more information on a hard drive (or floppy).

Disk compressors have been big business in the PC world, although, curiously, they have yet to make a big impact on Mac users. My suspicion is that, even though PC hard drives are cheaper than just about any other kind, replacing a PC hard drive is also a bigger pain than replacing a hard drive on any other kind of machine. This is primarily because most PC hard drives are internal, and changing drives thus requires opening up the machine and, occasionally, replacing an interface card or even the BIOS. Not easy or cheap.

Even though replacing an Atari hard drive is simply a matter of plugging a new one into the right port, I am still surprised it took so long for someone to come up with a disk compressor. Atari hard drives have been historically expensive. This is primarily due to the fact that they require a special adapter to turn SCSI signals into ACSI signals—and SCSI hard drive are among the most expensive kind.

At any rate, we now have a disk compressor, and by all reports, it is very solid—that is, no corrupted data. This is *very* important—it doesn't matter how fast or efficient a disk compressor is; if it fouls up the data, there can be hell to pay.

I remember using a PC disk compressor on my laptop computer. It worked fine until one day—*poof*—the entire hard drive was corrupted. I was able to restore everything from backup except for about two hours of work in WordPerfect. Needless to say, I never reinstalled that disk compressor (or any other one) on the laptop. Once burned, forever shy.

Disk compression can reduce the size of files by quite a bit. Exactly how much reduction occurs depends a great deal on the file, as we shall see shortly. However, on average, a set of computer files can be compressed to about 50% of their "normal" size. Program files reduce very little, while many database files can be reduced to less than 10% of their original size! For example, a dBASE IV file that was well over two megabytes compressed to 110K—a 95% reduction.

In order to understand how disk compression works, you need to understand that a data file on the disk is nothing more than a string of characters and numbers. In the case of a program file, these characters and numbers tend to have very little repetition, while data files for word processors and databases and spreadsheets tend to have quite a bit of repetition. The ability of a disk compressor to reduce file size depends directly on how much repetition of character strings there are in a file.

The most often used compression scheme is named for two Israeli mathematicians, Lempel and Ziv (and hence called Lempel-Ziv compression). Essentially, their scheme scans through the file to be compressed and identifies repeating strings of characters. Each string of characters is converted into a "token"—a smaller string (often just one or two bytes long) that represents the longer string in the file. Everywhere the long string occurs, it is replaced in the file with the token. A table is constructed that identifies the correspondence between the tokens and the repeating strings, and this table becomes part of the file.

This, by the way, is one of the advantages of Lempel-Ziv: it is self contained, and has all the information necessary to extract itself.

Of course, you would expect the act of compressing and decompressing a file would slow computer performance. It can, and often does slow the ST somewhat, but on machines with faster processors (such as the TT) you can actually get better performance with compressed files!

This is because there is a tradeoff in dealing with compressed files. The CPU has to do the work to compress or decompress the file—and that takes time. However, there is less data to move to and from the hard drive. Since disk access is quite a bit slower than the CPU, a significant reduction in file size can actually cause an overall increase in performance, especially when the computer is equipped with a fast CPU. Neat, huh?

Some PC compression packages even have coprocessor cards that speed up the compression and decompression steps further, but their increase simply isn't worth the loss of a "slot" in the PC.

At any rate, if you are running short on hard drive space, Data Diet from Double Click is certainly worth considering. It is virtually invisible to you—doing all its work in the background. There is even a set of utilities that tell you how much space you are saving. Even better, the setup utilities can compress the files you already have on your disk, so even that part is relatively painless.

Don't buy another hard disk!

1K 10K 100K 1M 10M
Empty Full

Data Diet is all you'll ever need.

Use files the same as always, but have them occupy ***much*** less disk space! The programs you use don't know Data Diet is trimming away the fat, but you'll notice the difference right away!

Includes Data Diet, DC Squish and Data Diet Tools. A complete system to save you megabytes of storage space.

Any file over 1K can be dietized. Two compression types built-in: type A is *fast*, type B is 10%-20% better compression. Count calories saved on drives. Batch dietize all files for fast setup. Save 65%-80% on word processing documents alone!

Boot up once with Warp 9, and you'll never want to be without it again. Warp 9 increases the speed of screen output dramatically - windows snap open, graphics appear instantly, and text *flies* onto the screen.

How is this possible? Most GEM programs display graphics and text by calling standard routines built into TOS. Warp 9 intercepts and handles these calls, with optimized assembly language code that is *much* faster than the built-in routines. Graphics and text still look the same, but appear with astonishing speed!

Warp 9 also includes a unique configurable mouse accelerator, desktop pictures, custom screen fonts and fills, and the Warp 9 Customizer, a program that lets you create your own fonts and fill patterns. And best of all, Warp 9 is compatible with all the programs you run. Ask your local Atari dealer for your copy of Warp 9 today!

’030: The New Standard

MC68030RC33B
10B67R
DEAC8907

George Richardson

The new standard in Motorola 68000-based family of personal computers seems to have become the 68030. Almost all of Apple’s current line of machines use at least a 68030 processor and Commodore’s Amiga line seems to be moving in the same direction. With the Atari Falcon ’030 machine that has been reported at various shows, and the already released TT030, it would seem the Atari line will also come to use this processor as its standard. Let’s take a close look at the 68030 and the capabilities it brings to the world of Atari computers.

The 68030 processor, as it was originally designed, incorporated all of the techniques Motorola’s engineers could think of to add more power to a microprocessor. Like it’s predecessor, the 68020, it has both a 32-bit addressing range and a 32-bit wide data path. It improved on the single cache in the 68020 by including separate caches for data and instructions.

It also has the ability to access memory in a number of ways, each of which makes a good compromise between speed of access and control of the memory, allowing the 68030 system designer to get the best speed where it is most needed.

Memory Interfaces

The 68030 was given an interface for standard 8-, 16- and 32-bit asynchronous memory accesses, to enable it to be interfaced to all standard memory and peripheral devices. The "asynchronous" refers to the fact that, like the previous members of the 68000 family, the 68030 can address memory that is not run on the same clock signal that it is. The 68030 will wait for the memory or device to signal that it is ready to send or receive information.

This is the slowest memory access method on the 68030, since it requires that the processor determine the memory size and address and set its control signals accordingly. In the Atari TT030, the so-called "ST RAM" is accessed this way.

The 68030 also has a special interface for faster memory accesses that are synchronized to the 68030 clock. This is called, strangely enough, the synchronous interface. This allows faster memory access than the asynchronous method, because less internal circuitry is involved. This interface requires 32-bit wide memory to work, since Motorola had to bypass the part of the circuitry that handles different data path sizes in order to increase the speed for these accesses.

The last external memory interface is a variation on the synchronous interface, and it is probably the one most people who have heard anything about the 68030 know about. It's the burst mode interface. This interface allows the system to fetch four 32-bit words from memory in less time than it takes to get two words by the asynchronous method, or three by the synchronous method, if the memory system is fast enough.

It does this by only sending out the first, or what's called the "opening," address of the burst mode access. The memory itself is then responsible for automatically incrementing the address and informing the 68030 that it's ready to send or receive data. Since the 68030 only sends out the starting address, the address circuitry is only used on the starting address of the burst. The next three accesses don't use it, eliminating any additional delay for them. This is what "Fast RAM" or "TT RAM" on the TT030 and 68030 SST board use to get their speed.

One interface that was present on the 68000 chip is missing from the 68030 (and the earlier 68020). It was referred to as the 6800 peripheral interface. This interface was used to allow the 68000 to easily interface to chips designed to run off of the phase 2 clock of the old 6800 microprocessor line. This allowed 68000 designs to make use of the plentiful 6800 family interface chips, since, at the time of its release, there were few chips capable of running at the 68000's 8MHz clock frequency.

In the Atari ST computers, the two 6850 ACIA chips used for the keyboard and MIDI interfaces use the 6800 peripheral interface of the 68000 chip. External circuitry is used to duplicate this interface for the 68030 chip in the TT and SST board.

Cache

Besides the external memory interfaces, the 68030 also incorporates control logic and 512 bytes of static data RAM for two internal memories—the data and instruction caches. These memories are used to store recently used data and instructions and supply them to the processor faster than external memory can.

Whenever the 68030 reads data from or writes data to an external memory location, it simultaneously stores that address into what is called an address tag memory in the data cache and writes the same data that comes from or goes into the external memory into the cache data location referred to by the address tag. The ability to put an address into the data cache during a write operation is selectable by a control register.

When a read or write of external memory is required, the cache system checks to see if there are any tag locations that match the address of the external memory being addressed. If there are, it reads the data in the cache location associated with the tag rather than waiting the extra time required for the external memory to supply the data.

On a data write, if the address is already in the cache, the system writes the data to both the cache and the external memory. The instruction cache only caches instructions read from memory. All writes to memory are considered data.

The cache in the 68030 can supply data to the CPU in one clock cycle, or less in many cases. Besides that, it is possible for the 68030 to fetch both data and instruction codes at the same time by fetching one from the cache and the other from external memory.

All of the previously mentioned methods of accessing external memory can feed information into the cache, but the burst mode method is set up only to feed memory into the cache. If the cache is not turned on, then the burst mode can't be used either. There are a number of methods of controlling the cache system. The two caches can be individually turned on and off by internal register bits.

Controlling Cache Usage

There are also some external signals that can be used to control and monitor the functioning of the internal cache system. The most important of these is the cache inhibit line, which external hardware (the system the 68030 is connected to) must use to prevent the 68030 from caching any memory locations that it should not.

On the ST, this line must be used to prevent the caching of any hardware registers like the serial port, parallel port or DMA hardware registers. If this isn't done, then the 68030 may end up fetching data from the cache rather than from, for example, the hard drive, resulting in a loaded file or program that consists of the same data repeated over and over. Considering most programs seem to be made up of more than one instruction, this does not turn out to be a good thing, so this line must be asserted during hardware accesses to prevent this.

Unfortunately, there is a small bug in the 68030 cache system that allows the 68030 to ignore the cache inhibit line during word wide (16-bit) writes to memory. Once the cache entry is made this way, the system will continue to use it regardless of the state of the cache inhibit line during an access. Fortunately, on the ST the hardware registers are all 8-bits wide, so this bug doesn't ordinarily affect the ST. At least it should not. It is possible to make a word wide write to the hardware, though, so this could cause a problem.

MMU

This brings us to the next major portion of the 68030, and the one that is the difference between the 68030 and all the previous versions of the 68000 family. This is the MMU or Memory Management Unit.

Don't confuse this with the Atari MMU (now called the MCU), because they have almost nothing in common besides an acronym. The ST's MMU is actually a DRAM controller; it is the "life support" hardware for the DRAM chips. It allows the DRAMs to be accessed by the rest of the hardware, including the video, DMA, DMA sound and CPU. The 68030 MMU is different. It is an internal 68030 system that controls how the 68030 interacts with external memory, rather than hardware for controlling and supporting external memory.

The 68030 MMU actually sits on the address lines between the 68030 CPU and the address pins on the chip itself. When it's turned on, it uses a set of tables to determine what action or address will result from the 68030 attempting to access a particular address. These tables can either be in external memory or in still another cache exclusive to the MMU called the Address Translation Cache. The purpose of this cache is to speed up the fetching of translation information from memory. If the number of translation tables is small enough, they can all fit inside the cache, which make the MMU translations completely invisible as far as speed goes. If the MMU must search external memory for the tables, then CPU memory accesses can be slowed down considerably.

The addresses generated by the 68030 CPU are referred to as logical addresses. For instance, the CPU may execute an instruction to read from memory location $10. Address location $10 is the logical address of the read. Depending on the setup of the 68030 MMU, however, the physical address generated at the output pins of the 68030 chip may be something completely different. For instance, it's possible to program the 68030 MMU to make the 68030 access location $1000010 whenever it tries to access location $10.

MMU Uses

The MMU can also be used to prevent the 68030 from accessing certain areas of memory at all. This is useful for implementing multitasking setups. The MMU can be set up to prevent different tasks from messing up each other's memory spaces. This can allow one task to crash without affecting others, thus allowing the other tasks to continue, or even crash on their own, if that's what they do.

The MMU can also be programmed to disable the internal caches on accesses to any or all memory locations. This is how it can be used to correct the bug in the cache inhibit line.

The MMU gives a programmer incredible control over the behavior of the computer. It can be used for simple debugging tasks by limiting the ability of a program to just access areas of memory and hardware that it's supposed to, and trapping for any unintended accesses to memory locations it should not touch.

It can be used to simulate memory or hardware that the system does not actually have. It can even be used to set up multiple "virtual machines" in a system—a "virtual Mac," "virtual Amiga" and "virtual Atari" could all be running at the same time on a system that was not any of the three. Of course, this all requires a great deal of programming, but it is all possible through use of the MMU in the 68030.

The 68EC030

All of the above information on the MMU does not apply to the 68EC030 chip. The EC chip, as I'll call it, is originally the result of Motorola's attempt to make use of 68030 chips that failed testing. In physical area, the MMU circuitry occupies more than two-thirds of the 68030 chip. This means, obviously, that the majority of

68030 failures were likely to be in the form of some problem with the MMU.

Motorola decided to test the defective chips with the MMU disabled, meaning that only the two transparent translation registers in the MMU would function. As long as those functioned, it was still possible to correct the cache bug, although the 16 megabyte size of the block affected by the transparent translation registers was very coarse.

Since this "new" chip put some constraints on the design of any systems that used this subset of the 68-030's functions, Motorola called this the 68EC030. The EC is short for Embedded Controller, a name used to refer to microprocessors used in systems commonly designed to run software specially written to control industrial equipment or other dedicated systems. In this fashion, Motorola felt the designer who used the chips would not have to be concerned about software written by third parties that either assumed that any 68030 was the fully functional version or that attempted to access hardware in such a fashion that it got caught by the cache bug.

An EC running in an Atari, or other 68030-based computer, can still run safely either by switching off the data cache, which takes a sizable toll on performance, or by using the transparent translation registers (referred to as the Access Control Registers) to make all supervisor mode data accesses non-cacheable.

This takes a much smaller toll on performance on an Atari, but since the Macintosh runs in supervisor mode all the time, these two methods work out the same when the EC is used in the Mac.

Since the data cache must be disabled during these situations, burst mode is also disabled, since it requires the cache to operate. For systems that use burst mode accesses, this causes an even greater slowdown.

It's possible to run an EC chip without taking any precautions at all, but if some software goes directly to the hardware with a word wide write, it may cause problems.

This doesn't mean the 68EC030 should not be used for accelerators or computers; it just means that compatibility becomes the burden of the hardware designer rather than Motorola or the software developer. Atari does not currently plan to use the 68EC030 in a computer, so this doesn't seem to be something we have to worry about.

This should give you a taste of the features of the 68030. As you can see, it has the performance and capabilities to raise Atari computers to a new level of power. Once enough 68030 machine are out there to spur on developers, you'll see applications for your Atari computer that you've never seen before.

accusoft·st

Quality Public Domain and Shareware for the Atari ST Computer Family Since 1986 - at the LOWEST Prices.

Accusoft-ST has what we belive to be the finest and fastest growing PD collection of IMG format clip art available. Our special collection has been scanned at 300 DPI(or reset to 300 DPI) for the maximum convenience of laser printer users. Of course, it looks great on dot matrix printers too! The Accusoft IMG collection is on Double-sided disks, containing an average of over 600K per disk (these are BIG images with lots of detail). Each disk includes our own ACCUVIEW viewer and slide-show program for IMG format files. A complete description of all our disk are beyond the scope of this ad, but listed below are our most popular disks. Our Catalog V4.0 disk is available and contains a complete list of all Accusoft-ST PD and Shareware disks. We have what you are looking for in games, utilities, clip art, applications, children's programs, midi, and much more.

The Power of Advertising?

Tim Holt
ACCEPT

I've never met John Scully, CEO of Apple Computers. I have also never met any of the Tramiels. I would venture to say, however, that if John Scully called up some company—say, WordPerfect—and said "Jump," the folks at WordPerfect would ask "How High and Where is the Hoop?"

If Sam Tramiel called up a company—say, WordPerfect—and said *"Jump!"* the people at WordPerfect would probably say something like "We'll have our people call your people, and we might do lunch. OK?"

Therefore, when I hear or read an article about John Scully, I will venture to say a lot more people pay attention to it than a Sam Tramiel article. With that in mind, I relate a recent item I saw involving John Scully.

While looking through a recent *Newsweek,* I ran across an ad for the American Association of Advertising Agencies (AAAA). The ad contained some quotes from John Scully about the effectiveness of advertising in today's market. I got to thinking about the Atari advertising campaign that seems to be getting off the ground now, and what might have happened if Atari had advertised a few years ago.

> *"The landscape is strewn with the wreckage of fine companies who built great products—that no one ever heard about."*

Do you *still* have to explain to your peers that Atari is not a game machine? I do. Just recently, I was trying to convince a fellow teacher to look at an Atari MegaSTE, like I own. He looked at the Atari brochure I handed him—it even had a pop up of the MegaSTE/4. The title of the brochure was "Mega STE: Business Computer."

After looking at the brochure, he asked, "But does it run *real* programs?" Real programs?!? I couldn't help but think that if Atari had really pushed the ST line of computers a few years earlier, I still wouldn't have to be answering questions like that.

> *"Advertising builds brands."*

I recently got into a "friendly" discussion on a local BBS about MIDI music and Atari. A fellow BBSer said he started out with an Atari for MIDI, but he switched to an IBM because his fellow students all used IBM machines.

I replied that Atari cannot be beat for MIDI, but he put up a decent argument that since no one else at his entire University music department used an Atari, he felt like an odd ball.

Peer pressure is very important in the world of computers, and although word of mouth is important, there has to be a first person to buy a computer. That "first" person will, more likely than not, be influenced by advertising.

It was nice to see the ads in *Discover* magazine in the last few months, and I hope that type of advertising continues. However, I must confess I was a bit confused as to why Atari would run a MIDI-oriented advertisement in a science/education magazine. Who are they trying to target here? Do a large number of professional musicians read *Discover: The World of Science?*

Would not an ad that demonstrated the educational benefits of the ST/TT be more appropriate here? Discover is published by the Walt Disney Corporation, so how about an ad showing how easy it is to draw and animate Mickey Mouse?

Who is Atari advertising to? Granted, the same MIDI ad ran in *Keyboard Magazine,* and that was a very appropriate place to put a MIDI ad. But a MIDI advertisement in a science magazine? I wonder...

"Most of our competitors of 1981 no longer exist. Some had great products. What they forgot to have was great advertising."

How long will Atari advertise? How long will Atari exist? I believe those two questions go hand-in-hand. Have you ever seen an advertisement for the TT? Have you seen an Atari ad in a place where you really did not expect to see one? Unfortunately, all the ads I have ever seen for the Atari line of computers were ones where I had to actually go out and look for them.

Have you seen any recent Atari ads in *BYTE?* In *Newsweek?* In *Time?* Sure, for the Portfolio, but what about the computers? We have been told the MegaSTE and the TT are the "flagships of the fleet," the pride and joy of Atari Computer.

Okay, let's put the money where the mouth is. Sam, Leonard, time to call up *BYTE* magazine—or have Bob Brodie do it, since that's now part of his job. Tell *BYTE* you will spend $X million in advertising in 1993 if *BYTE* starts running some decent articles about the Atari line of computers.

And I don't mean Jerry Pournelle telling us how he hasn't had time to look at the TT or that the boot up time is 12 seconds too long for his taste. I'm talking *real* articles, about productivity, hardware, etc.

By the way, if you think it sounds a little immoral to demand good press for advertising bucks, welcome to the real world folks. I don't think I have ever seen a bad review for a movie in *Newsweek* if the movie had a full page ad running there.

Demand the coverage. Let us see that Atari's management is as proud of these computers as the users who still buy them. Let us see that you are truly behind the "flagship" of the fleet. I challenge you to start advertising. Big time!

If you people in Sunnyvale still think advertising is not the way to go, consider that Coca Cola and Pepsi spend *billions* a year on advertising. Why? Surely they have worldwide name recognition. Surely the product pretty much sells itself. Why would they advertise so much? Because they know that even the slightest edge can translate into big bucks. A one percent increase in sales, due to an advertising campaign, easily pays for the ads. Profits increase. Sales increase. Everyone is happy.

"Advertising lets you express not only what you are, but what you are trying to become. It's not just a selling tool, it's a leadership tool—a flag on the mountain to rally and inspire your people."

It is time to rally and inspire. Let's get some severe ads going. Not just MIDI...not just DTP...but ads for everyone. Put them in *Good Housekeeping, Playboy, Life, Time, Newsweek!* All are very nice vehicles to take the message out to the world that "the Atari is a kick butt computer, and if you don't own one, you are falling behind the rest of the world." No more excuses about lack of product. No more excuses about this shortage and that shortage. The only shortage coming from Atari now is advertising. We're at the correct spot in the correct medium. The US is ready. The question is: is Atari ready?

"Only advertising can communicate not just information, but emotion and soul."

I know of no other product that inspires loyalty like the Atari computer. There are thousands of us out here that, through richer, poorer, sickness and health, have stuck by these machines. Surely, that emotion, that loyalty, that love, can somehow be communicated through an advertising campaign. I look forward to seeing it.

This is your invitation to the 1992 Connecticut AtariFest

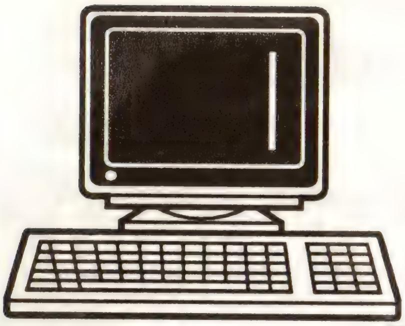
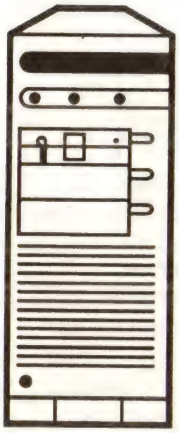
Next Month Look for MIDI Software!



IBM Blues

Michelle Gross
Milatari



The declaration "Atari users are dropping like flies around here lately" was recently posted on our own Milatari BBS. It can hardly be argued. User groups are folding. Many who are still in existence are cutting back on services.

I'm sure you have noticed the advent of MAC and IBM public domain collections being offered by AIM and other user groups, including my hometown club, MilAtari. This indicates the more widespread use of emulators.

Disgruntled 8-bitters who have held out upgrading for so long are not upgrading to the ST, STe or TT and longtime Atarians are buying IBM compatibles or Macintoshes. Yes, the Atari user base is shrinking.

A fellow user group member was heard to say "I would not recommend an Atari computer to a friend. There just isn't enough software available out there." I can understand his attitude. I was recently in a position to promote the use of an Atari Computer, and I resisted because of that same uncertainty.

Not long ago, I became involved in a newsletter committee at our church. Church leaders were interested in starting a monthly newsletter to improve communications and reach out to the poinsettias and Easter lilies of the parish. They wanted the newsletter to be put together in-house, and they were considering similar changes with their weekly bulletin. Computerizing parish records was also in the works.

A separate committee was formed about that time to purchase the computer for the parish. Naturally, I joined that committee as well. (MilAtari members would appreciate this, as I seem to be know for my propensity for joining committees). It was assumed from the onset that the computer would be an IBM compatible. One committee member owned a Macintosh and I own an Atari, but the assumption was still IBM. For a variety of reasons, I bit my tongue and resisted the urge to recommend looking at alternatives.

Eventually we purchased an IBM compatible, an overpriced and overrated church census program, and desktop publishing software. I was offered the position of Newsletter and Bulletin Editor, and I took the job. I've now had firsthand experience using the "other" computer.

In the meantime, my dad developed a need for a home computer. Again, I felt that twang of guilt, and the hesitation in recommending the Atari for all the right reasons: you can't find many dealers, the software is drying up, no local stores carry Atari software, there are no glossy magazines, etc., etc., etc.

Dad lives in South Carolina and we had planned to pay him a visit right after the Chicago ComputerFest by Atari. After having been to an all Atari show, we were all pumped up over our own brand of computer. We then thought we would take the opportunity to visit the "infamous" Atari store, Computer Studio, in Asheville, North Carolina, a mere hour from my dad's home.

On our initial visit to Computer Studio, Dad took along some MS-DOS software he had received as a result of his own volunteer activities. Because he expressed an interest in being able to run the software, Sheldon Winick, the store's owner, showed him the IBM clone he carries for just that type of customer. My heart sank. However, after careful evaluation of what exactly his needs would be during the drive home, we came to the conclusion that Dad didn't need to run that software at all.

Meanwhile, I had gained more and more experience on the IBM clone at the office. Although I initially welcomed the thought of learning a new operating system and getting a feel for the IBM world, I quickly became disillusioned with Big Blue. I acquired a new appreciation for my little orphan at home. Once, after an especially difficult day at the office, I came home and blurted out, "If we had bought an IBM, it would be upstairs collecting dust!!"

My frustrations lie with the complexity of basic operations such as copying and deleting files, formatting, and even viewing directories. For seasoned 8-bit users, perhaps the MS-DOS environment is like a summer home, but for people who have never used a computer, or for ST-only users, this DOS is a nightmare come to life!

Installing programs is not simply a copy and run operation as it is with the Atari. Many programs require a change to the CONFIG.SYS or AUTOEXEC .BAT files, which the computer reads at boot up, similar to our own AUTO folder programs and accessories in an odd sort of way.

Are you used to loading your favorite accessories and fond of some of the AUTO folder programs on the ST, like Universal Item selector, Image Viewer, or the countless others available to us commercially and in the public domain? Well, forget them all...in fact forget the concept of accessories and boot disks in the IBM world. There are no boot disks, item selectors, or accessories as they exist on the ST (except under PC GEM, which is pretty much unsupported on the IBM, or under Windows, which is extremely slow on most systems).

While we're on the subject of item selectors, the MS-DOS way of handling files is unbelievably lacking...at least in the software I'm running. I found out very quickly why hard drives are not partitioned into smaller, manageable sections in the IBM world.

In my mind, there is something very logical about the use of directories and subdirectories for managing your programs and files. I rather like the use of partitions on my hard drive, so I don't have to wade through endless folders and files to find something. Having drive partitions set up—one for DTP, another for CAD, a small partition for games, and of course your boot drive partition—with folders/subdirectories for various programs is a neat and organized system.

The IBM item selector does not allow you to read the contents of floppy drives (or partitions) by the click of a button. Instead, one is reduced to command line entries while in the item selector to see what is on drive A or B. Yuk! None of the replacement item selectors I've seen within programs or shells or Windows even comes close to the ease of disk and file management from the Atari desktop.

Support is not what you would think in the IBM world, either. I was amazed to find that many support lines are...would you believe...900 numbers!?! Could you imagine the uproar if ISD, Codehead, or any of our other favorite developers announced that they would be instituting a 900 number, at a cost of $2.00 a minute for technical support on a $100 software product?!!!

We Atarians are spoiled. Not only do we enjoy a level of third-party support like no other, but we often are offered that support by the author of the software. I like the closeness and personal touch the smaller TOS market has to offer. MS-DOS, no thank you!

All the frustrations of the past months came to mind when I spoke to Dad about his impending computer purchase. I envisioned the problems he would encounter as a novice. Perhaps I was wrong in thinking that if I, an intermediate computerist with a working knowledge of basic disk operations, was frustrated by the MS-DOS environment, then it would be even more difficult for my Dad to deal with as a new user. How long would it take before the CPU became an oversized paperweight on the desk in his den?

After considering my own experiences, and knowing exactly what Dad would want to do with his computer, I decided I had no choice but to suggest he look at the Atari. The software he would need is out there... after all, how many word processors does a person really need? I have been using Word Writer since I bought the computer and have yet to find it lacking, in terms of my needs. From ST Writer to WordPerfect and now Calligrapher, the entire range of wordprocessor capability is available on the Atari ST/TT computer. The same is true of every other computer software category—spreadsheets, databases, DTP, etc.

Dad's needs were not much different than my own. Yes, I feel a little twinge of guilt when he has noted the masses of MS-DOS titles at stores all over town. But, I have seen the titles too, and I would answer that 90 percent of them are junk. We have junk on the Atari platform as well, but overall I firmly believe that our available software has the most bang for the buck: Calamus, PageStream, DynaCADD, WordPerfect, D.A. Brumleve's Kidprgs, Word Writer, etc., etc., etc. Besides, what is currently available in the ST line would keep the most industrious of users busy for years!

Dad did buy the ST and already has joined a user group. I've been able to help him get going over the phone, as has Sheldon Winick and his new-found friends in the Greenville Atari Computer Enthusiasts (thanks guys!). He's now online on GEnie (B.SCHLAEGER1). I do not regret making the recommendation to buy Atari. I often consider what Dad would now be doing if he had purchased a PC clone.

I now regret that I didn't speak up at my church. Never again will the argument "that's what everyone else is using" wash with me. I have promised myself that never again will I pass up another opportunity to introduce the family of Atari Computers to a new or seasoned user...for whatever reason.

(Announcement)

SFAN NEEDS HELP!

Mike Kelley

The Space, Fantasy & Adventure Network (SFAN) is the first and only satellite/cable television channel devoted entirely to the SF and Fantasy genre. The Atari community could benefit greatly from the existence of this channel, since Atari computers, especially the TT, would be used extensively onscreen and behind-the-scenes at SFAN.

SFAN is ready to debut to the world, and they want *your* help! Here's an excerpt from a recent SFAN press release sent to AIM:

Begin with Walter "Chekov" Koenig as a spokesperson and host/producer of a movie/TV oriented talk show, throw in Bjo Trimble (whose letter-writing campaign saved *Star Trek* in 1968: she afterward worked with Roddenberry), add *High Frontier* space advocacy group, stir in a bit of Atari Computer Corporation, mix with our slogan from Arthur C. Clarke ("Science fiction is the only genuine consciousness-expanding drug!"), throw in some serious industry personnel (including development, executive, marketing, and engineering professionals), fold in programming content and format nothing like "a cross between MTV and The Disney Channel," and put it in the determined hands of a Science Fiction, Fantasy, Adventure, and Horror devotee. Combine it all and you have SFAN.

At this moment, we are in the final stages of negotiation with another *Star Trek* original cast member and anticipate an initial meeting with yet another shortly. After face-to-face meetings, cooperation from a number of renowned science fiction writers awaits only our successful acquisition of funding.

SFAN is in negotiation for funding this project and we have taken this opportunity to give *Star Trek* and other enthusiast groups a "sneak preview" of our forthcoming public announcement and ask for your support. We need you to help convince the cable industry of the existing audience and the support we can expect...they only understand the concrete reality of numbers.

Successful negotiation for funding can result in the money necessary to enable SFAN to launch promptly, but that does not guarantee carriage by the largest cable multi-system operators (MSOs). The top five MSOs constitute almost 40% of the nationwide cable systems and are on record as doubting the audience and the availability of programming for a channel like ours.

Back in 1968, NBC received over one million letters to save *Star Trek* from cancellation after its second season; a half million letters resulted in the naming of the Space Shuttle Enterprise; and a half million letters to President Reagan twice helped save the space program. The source for all of these letter-writing campaigns has been, and continues to be, dedicated fans. Bjo Trimble was pivotal in all these efforts and, as our Director of Viewer Relations, has made our goal delivery of a half million letters demanding SFAN to each of the five top cable multi-system operators: the sort of reality they understand.

However, "writing to your local cable company" is a waste of your time and money. Your letters serve only to fill their wastebaskets. You have to hit the cable MSOs at the executive level.

When the word to "engage" is passed, you can make yourself and your friends part of the success of SFAN by writing to the cable MSOs, proving you do exist and that you demand more than "The Persian Shopping Channel." We look forward to hearing from you and serving you for years to come. The addresses and names of the top five cable MSOs is provided here for your convenience.

It can *only* happen with you.

SAMPLE LETTER

MSO Address
XXXXXXXX
XXXXXXXX

Dear____________;

I support The Space, Fantasy & Adventure Network (SFAN), a new cable television channel about to launch its services. As an enthusiastic viewer of this type of programming I urge you to carry this service as soon as possible.

Based on the success of science fiction, fantasy, adventure, and horror movies, box office revenues as well as the amount spent on books, souvenirs, and collectibles, SFAN is an obvious choice for your systems.

I again encourage you to immediately make SFAN available to your subscribers.

Sincerely,

Your name
Address

TEC
TOS Extension Card

Upgrade your 520ST, 1040ST, Mega ST, or Stacy to Atari's new TOS 2.06!

TOS 2.06

"The TEC has given my computer a new lease on life … it's a 'must-have' for any ST owner!" – Ron Luks, Founding Sysop of the Atari Forums on Compuserve

CodeHead Technologies is proud to announce the TOS Extension Card! This amazing device lets you install the very latest version of Atari TOS (2.06) in your 520ST, 1040ST, or Mega ST!

That's right! Now, you can have the same excellent system software that owners of Mega STes and TT030s are enjoying, without spending megabucks for a whole new computer system.

TOS 2.06 includes a totally redesigned GEM desktop that has most of the features of the popular alternative desktop programs, but with two big advantages: it doesn't gobble up large chunks of memory, and because it's in ROM it takes no time to load from disk!

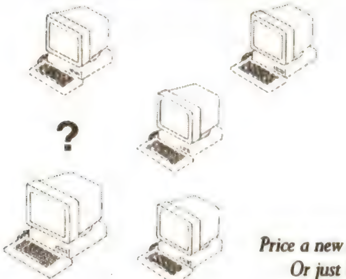
The TEC fits in any model of ST computer, regardless of design, and it works with existing upgrades like MS-DOS emulators or hardware accelerators.

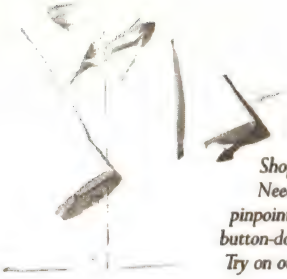
There's even a "switch" option that lets you return to your older TOS at any time. And the low price of $139 includes the official Atari ROM chips!

Step into the future of Atari computing – order your TEC today!

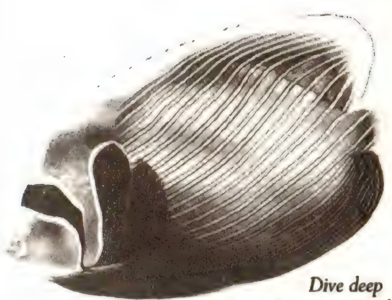
CodeHead TECHNOLOGIES
PO Box 74090 LA, CA 90004 213-386-5735 Fax 213-386-5789

Find out why your PC won't talk to your LAN. And what you can do about it.





Shop. But don't drop. Need a 100% cotton pinpoint oxford shirt with button-down collar? In ecru? Try on our Electronic Mall.®

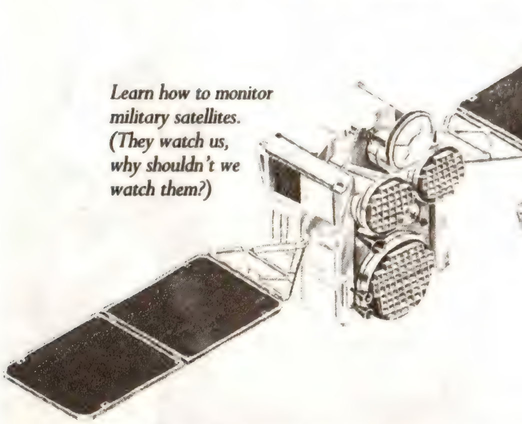


Dive deep into aquarium lore. Like whether a canister or protein filter is better for a 110-gallon salt-water tank.

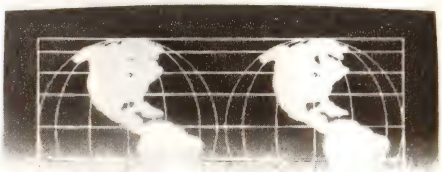
Price a new Mustang. Or just learn everything about it.

Finally, a computer information service you can't outgrow. No matter how hard you try.

Learn how to monitor military satellites. (They watch us, why shouldn't we watch them?)



Find out just what the heck a zither is.



Talk to twice as many people about parallel universes.

No matter what you're into, you can get more out of CompuServe.

You can range widely over a list of services that will help you, entertain you, teach you, and challenge you. Or delve deeply into your favorite topics, learning (or even teaching) more, meeting experts, and making friends with people who share your interests.

CompuServe lets you do everything from keeping in touch with our communication services, to getting advice from online hardware and software experts. It's the one computer information service you won't outgrow.

But you will have a good time trying.

For a low one-time membership fee and $7.95 a month, you can use our most popular services as often as you like: news, sports, weather, shopping, reference materials, our electronic mail service of up to 60 messages a month, and more. Plus, there's a whole universe of other, extended options available at nominal additional charges. Your first month on CompuServe will be free, and we'll give you a $25 usage credit to explore our extended services.

To buy a CompuServe Membership Kit, see your computer dealer. For more information, or to order direct, call 800 848-8199 (614 457-0802 for international inquiries).

CompuServe®

The information service you won't outgrow.

Handheld TOS?

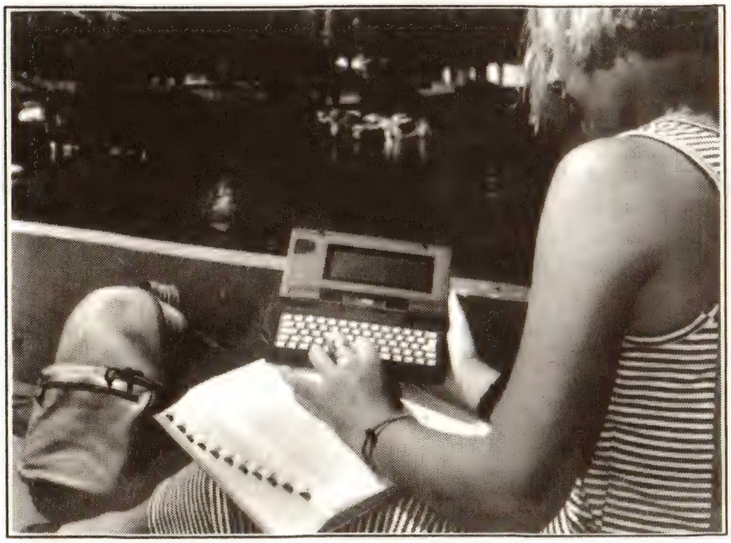
Portfolio by Atari for Atarians

Donald A. Thomas, Jr.

One of the most popular features of Atari Computers' products is the ease of use. From the instant they are switched on, users find the operating system to be as compatible to their needs as a pond is to ducklings. But when designers of the Portfolio handheld computer went designing, they opted for a non-graphics operating system and installed an enhanced emulation of DOS 2.11.

The reasons for PC DOS are multifaceted. One is that a 256K ROM and 240x64 resolution screen is hardly adequate for state-of-the-art TOS (Atari's operating system) with GEM. Another is that it may not be practical to require a mouse in order to drive a computer which is not much larger than a video cassette tape. The reason for DOS 2.11 is to provide essentials, while leaving room for enhancements and the five built-in applications.

The enhancements to the DOS 2.11 emulation of DOS deal with battery conservation and, more importantly, a menu system. Having a built-in menuing system means software can be, and is, written to offer commands and options by "point and click" operations. To accentuate this, Atari provides File Manager with every Portfolio. File Manager is a RAM-based program that allows DOS options through this menu system. Files may be copied or deleted and programs may be activated with this system.



It is easy to resent the DOS-based Portfolio after experiencing the benefits of the popular Atari systems. What may not be immediately clear is how compatible the Portfolio is to TOS.

Actually, any DOS-based clone is compatible to Atari desktop computers. For instance, run WordPerfect on a DOS-based PC, save a document to a 3.5" diskette, move the disk to an Atari TOS system and the Atari's version of WordPerfect will read the document just fine. ASCII files are 100% compatible between systems also. Spreadsheets on the Atari ST/TT support Lotus 1-2-3 files and many ST/TT databases can import files directly from popular IBM packages. This universal compatibility of many file types is how major on line services such as CompuServe and GEnie thrive...how all kinds of different computer systems may use the same service.

Most knowledgeable Atari TOS users will rightly argue that it makes a lot of sense to not buy the IBM—to pay less and get a lot more with an Atari desktop computer system. This same Atari philosophy can be extended to apply to the Portfolio. The Portfolio is value priced (less than $300). It may be used with an "anti-DOS" menu system called "File Manager." It has five useful software applications built-in, and every file may be exchanged with an Atari TOS system.

To transfer files with an Atari desktop computer (ST/MEGA/STE/TT), the user needs to have a Serial Interface ($79.95 MSRP) for the Portfolio. It easily snaps into an expansion bus on the right side of the Portfolio and provides an industry standard 9-pin RS-232 serial port.

From that port, a null-modem serial cable is required to make a connection directly to the desktop computer's industry standard serial port. Most electronics and computer stores sell the RS-232 cable and null-modem adaptor. The connection allows the two computers to "think" they are connected via modem over the phone lines.

Once connected, Xmodem file transfers can take place using communications software on both computers. The user prepares an Xmodem "upload" on one computer and an Xmodem "download" on the other to initiate the transfer. Popular communications programs are Flash, STalker or Interlink for the desktop TOS machine and Xterm2 or ACOM for the Portfolio.

It does require a little set-up to perform the first file transfer between a Portfolio and an Atari desktop computer, but it is a lot like riding a bike—once you learn, it's easy to do over and over. There are commercial packages available to assist novices to accomplish this with least aggravation. One example is "TransporT" by Artisan Software.

Now that we have established that the Portfolio *is* file compatible with Atari desktop PCs, we may see a greater value in what the Portfolio has to offer. From daily schedule planning to memos, reports and database management, the Portfolio offers a powerful punch within a package weighing less than one pound. With the same Serial Interface required for file transfers, Atarians can link with any Hayes-compatible modem and remain in touch with the world even while on the road.

Other Portfolio accessories include a Smart Parallel Interface which enables direct printing access. Desktop DOS users may also use the Parallel Interface as an additional way to transfer files. Memory Cards are available for the Portfolio which behave exactly as floppy diskettes do for desktops. Most users acquire and only need one or two Memory Cards and occasionally backup critical data to their larger desktop system. For those who want the added storage, there are even hard drives available that connect to the Portfolio via the Parallel Interface.

There are numerous third party supporters of the Portfolio, and Atari has introduced several software titles, too. Popular titles include PowerBASIC, Instant Speller, Chess, Physician's Desk Reference II, DOS Utilities and more. A complete catalog is available for just $1 from Atari. Ask for the APB Catalog, Portfolio Marketing Department, Atari Computer Corp., 1196 Borregas Avenue, Sunnyvale, CA 94089-1302.

For 24-hour support of the Portfolio, users are encouraged to join Atari experts and avid users in the Portfolio forums of GEnie or CompuServe. There are well over 750 Portfolio files on CompuServe and many are ready to run programs. User contributions of quality public domain and shareware applications are growing fast due to the Portfolio's ease of development.

With PowerBASIC for Portfolio by Atari, users can write program source code on their Atari TOS desktop if they want. Source code is generated using an ASCII text editor, then the code may be transferred to the Portfolio using the Serial Interface for compiling and runtime testing.

Possibly the nicest feature of the Portfolio is how it widens the Atari marketplace to absorb avid PC users. They have come to enjoy what the Portfolio has to offer and each Portfolio used is a walking advertisement to help inspire that next Atari purchase.

[About the Author: Don Thomas is the Portfolio Marketing Manager for Atari Corporation. He is also president of Artisan Software, producers of a number of products for the Atari ST and Portfolio computers.]

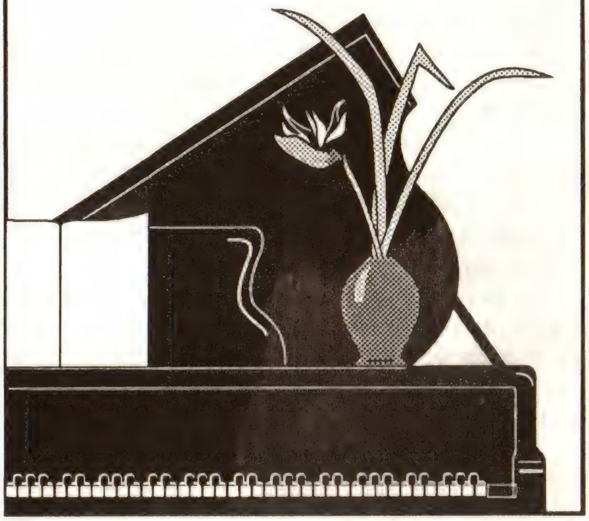
MIDI in the Midst



Before jumping back into my Hybrid Arts profile, I must report, briefly, on a recent event:

At the Atari Canadian Exposition (ACE '92) held in Toronto, Ontario, on April 4th and 5th, our users group, ASTMUM, manned booth #316. We gave advice on the art of making music, conducted MIDI demos and displayed the productive output (sheet music, cassettes and CDs) of our members.

The most popular activity, at our booth, was showing beginners how they could get started in MIDI on a shoestring—with excellent results! Most gratifying was meeting some terrific techies and musicians who came out of the woodwork for this show. Many were interested in our chosen method for expanding older STs RAM to 2.5 or 4 megabytes, so we kept popping our computer open to show 'em!

I managed to get away from the booth long enough to buy CodeHead's newly released TOS Extension Card. Since videotaping a "New TOS" seminar at the WAACE show last October, I've taken a great interest in this topic. I'll install it, run tests, and probably do an article about it. Readers in the Northeast who are reluctant to solder in or handle these sensitive devices could contact me about installing their TOS Extension kits (and our preferred RAM expansions!) for them.

Kest Carter-Morgan
ASTMUM

About 10 of our members made the trip from Montreal; they fanned out and garnered a lot of goodies and information.

Visitors kind enough to leave their addresses at our booth will receive follow up letters. In fact, any AIM reader interested in our group's activities should write (ASTMUM's address can be found in the Users' Group list at the back of this issue). Above all, it was people's open appreciation that made it worthwhile for me.

While the event is fresh in our minds, we'd like to post our heartfelt thanks to Atari, the Toronto Atari Federation, the show's organizers and volunteers, other exhibitors, and the Skyline Hotel for putting together and running such a fine exhibition!

Now, let's get back to Hybrid Arts.

The significance of direct-to-hard-disk, digital recording is lost on many non-musicians. Some musicians aren't even aware of the impact this relatively new technique is having on their industry.

Traditional, analog, audio tape recording, when done well, has delivered excellent results. It's when you have to overlay or "bounce" multiple tracks, that the "noise floor" begins to rise.

Shuttling tapes back and forth, snipping out bits of dialogue, trying to fix a sour note after the artist has left the scene, trying to correct timing errors—all these are aspects of the engineer/editor/producer's craft. These chores require a gutsy mix of patience, skill, acute perception, nerve and, yes, *luck*. That's why traditional engineers' eyes pop (and jaws drop) when they see how easily those tedious, difficult (sometimes even impossible) tasks are dealt with in the digital domain.

Suddenly, you have *random access!* No waiting! You can retire your splicing block. To a greater extent, you can construct things without having to consider the penalties for your actions (e.g., noise buildup). However, along with this alleviation of tedium comes something that is paralytic for some: *unlimited choice!* Suddenly, the world becomes your sonic oyster.

How Hybrid Arts innovates in cost effective technology would be wasted if they didn't keep track of the user interface. In this regard, they have done well, by consulting users as their Digital Master system evolved.

Although I will, near the end of this segment, convey information on their new, 4-channel version, allow me to finish describing the demo of the 2-channel system which I began in the May issue.

If you haven't seen it (or pictures of it), the system is contained in a hefty-looking box, resting on, and apparently blocking, the entire length of a STE's ventilating grid. The box extends, and is supported, a considerable distance behind the computer.

Closer inspection reveals two analog and two digital inputs in back, with one or more fans, and an opening in the bottom to prevent heat from the ST's power supply from piling up. Almost any 520 or 1040 ST will do, as long it has been expanded to four megabytes (needed when accessing the EDIT page).

The massive, color-matched case (mated to the computer) can accommodate most smaller hard drives (around 120 megs). Larger banks of drives must be housed externally, however. The visual impression is formidable, but functional.

A strap-like, flat cable extends down from the left side to connect at the ST's cartridge port and, of course, the inevitable connection is made to the DMA port. These connections explain the need for the unit's intimacy with the computer; they must be kept as short as possible. However, if you want to extend the distance between units, ask Hybrid Arts about how they've dealt with this.

A suite of programs comes with the system:

The Digital Recorder/Editor (DRE), for recording long sound files (limited by the capacity of your hard drive(s)

The EDIT program, for "microscopic" editing, retuning or reversing of sounds (limited by capacity of the computer's RAM)

The CUE LIST, an edit decision list that runs concurrently with SMPTE sync. in order to trigger events (on the hard drive) at selected SMPTE numbers (for video, post-production use)

The MIDI program, for MIDI control of events on the hard drive

Due to space constraints, I won't cover all utilities and functions; I'll try to keep it neat.

Now, envision if you will, that we're immersed in that demo with Jeff Naideau, Sales Manager for Hybrid Arts. He has just shown how items on the playlist can also be played via MIDI; you can set them up to be triggered, by notes of your choice, from your keyboard or sequencer.

Moving on to the EDIT page, he displays (from left to right) the varying envelope of a section of music. This resembles an enlargement of an optical, movie soundtrack. A vertical, hairline cursor travels across the envelope, during PLAY, giving your exact location in the piece.

You left-click and drag the mouse to create a "range" (Hybrid Arts' expression for a working increment). This could be an entire song, a musical phrase, or a tiny blip of sound; you define it. Then, you do things to the range: cut it, copy it to somewhere else, retune it, etc. To visually emphasize details, you can zoom in on, or enlarge, a range, and if you've saved a particular view of it, you can snap back to it any time.

When it comes to precise editing, the system can be made to behave in a manner similar to an open reel, analog tape deck, which, by hand-rocking the reels, back and forth, in PLAY/PAUSE mode, used to reveal where (on or near the beat) to mark the tape with a grease pencil for splicing.

Digital Master emulates this by employing an optional, outboard controller—the J.L. Cooper CS-1 (about $500 list). It has a rotary knob, just large enough to effectively "scrub" a phrase or beat (e.g., a snare drum) *Paiowww - wwwoiaP*, back and forth, until your ears, and the on-screen cursor, confirm the desired spot. Very gratifying!

The CS-1 is great, but when I saw Jeff Naideau do this same operation, easily, with the mouse, I started laughing so hard I almost dropped the camera.

Where this system really shines is in pitch and time correction. Jeff played an example in which a repeated guitar figure retained its pitch, while the backing rhythm was artificially and steadily increased. Vocals were retuned with ease. Even during extreme examples, and when doing the previously mentioned "scrub" edits, the sound was natural and free from aliasing or spurious noise.

I won't elaborate on the digital filtering functions at this time. It's also important to note that the lack of programmable equalization doesn't seem to hamper people in getting work done.

I'd say that if I wasn't obliged to complete other, important projects, I'd drop everything, now, and get involved with this system, particularly the new, EX version.

As promised, here is the latest information gleaned from a telephone conversation with Brad Eisenhower of Hybrid Arts:

The 4-channel, 16 virtual track, "EX" version, though delayed, should be available in June. You can also order the software update and a rack-mount unit to add the two extra channels to the existing system.

Retuning and sample rate conversion (on both versions) is no longer limited by the computer's RAM. What used to be done with the EDIT program can now be done (within the Digital Recorder/Editor program) to an entire song or hard disk file (in cents, half-steps and octaves).

Advantages, in the software, allow you to work more organically: writing elaborate crossfades to the hard drive; doing "destructive" cuts to a file and not losing track of your important markers; being able to mark, cut and paste between many different windows while retaining the thread of your intent.

The number of sound files you can open is no longer limited to eight—it's unlimited! The new software works on the large Moniterm and Atari monitors, providing a much bigger work surface on which to manipulate files. There have been improvements in how the system locks to SMPTE; moreover, in how it "chase-locks" to SMPTE.

CHAOS, Hybrid Arts' proprietary multitasking operating system, allowing true, simultaneous operations, will be released with their new EX version. Brad Eisenhower wasn't apprised of the degree that this involved Atari's new multitasking TOS (Multi-TOS).

A small line driver (buffer) box now plugs into the cartridge port, enabling the new EX version to be placed up to 10 feet away from the computer.

Additionally, they've come out with a DMA to SCSI adapter which enables the new system to use standard SCSI drives directly.

For some reason, the favored "Quantum" 105 Meg drive, combined with the ICD host adapter, conflicts with the digital recording system. If, when you're at the point of placing your order, no cure has been announced, then you'd be safer sticking with a Fujitsu, Maxtor, Hitachi or other drive, proven in this application. Avoid the Connor drives, too, they say.

They are enthusiastic about their new Sample Playback Module. It offers 12 audio outputs; 16-bit, 24 dynamically allocated voices (at 44.1 kHz); effective interaction with the Digital Master, SMPTE timecode and S-MIDI specs.; and one to 16 Megs of SIMM RAM space. It can load samples through SCSI and conforms to the "Sound Designer" format.

Also announced is their new ST-MAC CD-ROM software which, with the above, reads and accesses all Macintosh sound libraries for the Atari ST.

Stephan Daystrom is writing an update of Smpte-Track Gold, which should also be ready by press time. Not having heard from him, yet, I've decided to delay my sequencer segment in this series of articles, until the multitasking details get clarified. I'll try to put together a Smpte Primer for beginners, as well.

Note: The lowest selectable sampling rate figure, given in Atari Explorer, was technically correct. They were just repeating information given in Hybrid Arts' brochure. You can obtain that rate from the EDIT page. However, in the DRE program, the lowest selectable rate on its menu is 22 kHz. It is not common practice to use such low sampling rates when making a high quality, wide bandwidth recording.

Now, which breakfast cereal should I choose?

Until next time...

[About the Author: Kest Carter-Morgan is an audio/video recording engineer, electronic prototype designer and computer repair technician specializing in ST-related projects. He is one of the founding members of Atari St/Mega Users (Montreal).]

Pictures to Text
OCR Comes to the Atari

Bill Pike
PAC

[Review copy of Migraph OCR 1.05 loaned by IB Computers, 9244 SW Beaverton, Hillsdale Hwy., Beaverton, OR]

What does OCR from Migraph do? OCR—Optical Character Recognition— has one purpose and that is to change "text" in an IMG or TIFF monochrome scanned image into of a page of text. Currently the only output available is ASCII text, but almost every wordprocessor imports this type of file. How does it work? It works very well!

The manual isn't kidding when it tells you to disable all auto programs and accessory programs. This program does use all the memory it can get. (Also, on general principles, don't set the Fastload bit, telling the program to skip fast loading. This is something I routinely do with a program that uses all available memory.)

The requirements for using this program are:

Some way of getting a picture of the page into the computer in IMG or TIFF format. This usually means, you need some type of a scanner—flatbed, sheet-feed or hand.

Two or more megabytes of memory—the more the better. If you don't have enough memory for the document, OCR will use "Hard Drive Caching" to store the extra data. Using this virtual memory feature is much slower than using existing RAM.

A hard disk

Nearly $300 for the program

Who Needs OCR?

You are probably asking yourself who needs this program? People doing extensive DTP work need this program. OCR allows them to scan in text from *any* hardcopy and create a disk file that can then be edited, spell and grammar checked, popped into a DTP package and output to a printer.

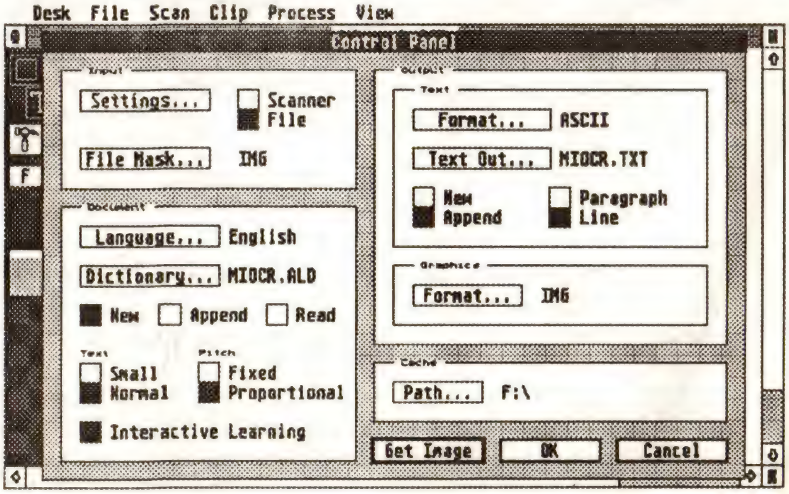
What if you're a poor, forgetful person writing the Great American Novel. You didn't make floppy disk backups of the text you saved to hard disk, and the hard disk crashes. Oh, @#%%#@! Now you have to retype the entire thing? If you have hardcopy and Migraph OCR, though, you are able to scan the text back in and recreate the original files with a little effort—a *lot* less effort than retyping the original.

Anyone who needs to transfer something from a written page to a computer text file needs Migraph OCR.

Font Recognition

OCR already recognizes Artisan, Bookman, Brougham, Caroll Pica, Courier, Courier Italic, Delegate, Elite Modern, Helvetica, Herald Elite, Letter Gothic, Lori, Lubalin, OCRB, Pica, Prestige Elite, Prestige Italic, Prestige Pica, Times, Titan and Title typefaces.

If the document you are scanning contains a font other than a pre-recognized one, you can rename the .ALD file (from the control panel)



Input
☐ Scanner
☒ File
File Mask... IMG

Cache
Path... F:\

and OCR creates a dictionary of the new typeface. You can save this new dictionary for use the next time you scan a similar document.

OCR also creates a dictionary for letters it doesn't understand within these typefaces; this dictionary is overwritten the next time you use OCR if you don't rename it.

I strongly suggest you name your dictionaries by the type of document you work with rather than by typeface. For example, name them ST-Informer, Computer Shopper and Newsweek rather than Times, Helvetica and so on. The same typefaces in different publications aren't always consistent enough to allow full recognition of all characters from one publication to another. The dictionaries are around 100K long.

Scanner Support

Let's get down to the nuts and bolts. Migraph's OCR takes direct input from any of the following hand scanners: Migraph (you knew that it would support that one didn't you?), AlfaData , and Golden Image . OCR also accepts monochrome IMG and TIFF format files, for those that have full page or flatbed scanners.

There is a problem in using a hand scanner image—the scan is only four or so inches wide. If you are trying to scan large areas of text, this is a problem. Needless to say, Migraph has a cure for that. They recommend scanning directly into the OCR program and processing each scan independently. OCR can then construct a text file for the first scan and append the later scans to it. There is also a scanning frame available to facilitate scanning.

If you input from a flatbed or other full page scanner, you must first save each page as a IMG or TIFF file. You then load the file into OCR.

Text vs. Graphics

Once you have an image in the program, you are almost ready to start converting it to text. First, you need to define what is text (or what part of the text you want) and what is graphics (if you want to save out the graphic as a file). This helps the program to keep things on track.

If text has been "flowed" around graphics, you can use a polygon to define the text area—you aren't stuck with defining only a rectangular area. If the text is broken up all over the page, you can define a number of text areas and tell OCR what order in which to processed them.

If your scanned image is rotated a little off center, OCR can perform very minor rotation of the image so imperfections in the scan are taken into account. If too much rotation is necessary, you will need to rescan the document. Also, OCR will perform major rotations in 90 degree increments you can even scan something sideways or upside down.

You can also scan white text on a dark background. OCR doesn't care and handles it just fine. Sometimes it may be advantageous to work from a black/white inverted image; the program inverts images on request. Text from 10 to 18 point sizes are accommodated directly. Letters of larger sizes also work OK, and scans of smaller text is taken into account by setting the smaller text option. I have found that a 150-200 DPI scan is adequate for 12-18 point text and 300 DPI is good for 10-15 point text. It is recommended that 400 DPI be used for text smaller than 10 point, though I have been able to use 300 DPI for 8 point type without too much trouble.

Once you have scanned the hard copy, loaded the image into OCR, rotated the image as needed, defined the text and graphics areas (you only need to define the text areas unless you also wish to output the graphics), set the output file for the dictionary (if the typeface isn't one already recognized by OCR), and set the text output file. By the way, if you forget any of these steps, OCR will muddle through on its own and pretty much get things right (idiot proofing).

Tests and Checks

For the actual conversion to text, OCR checks the typeface against its dictionary, then runs the text through 25-100 or so linguistic tests, as needed. If it doesn't recognize the typeface, OCR asks for help from you.

OCR then checks for English, German, Dutch and French letter combinations, according to your settings (you can only have one linguistic base at a time active, but you can have all the various bases on the drive). These checks have to do with the words, letters and types of letters OCR is expecting to find. OCR also does a very good job at differentiating between 1 and l, 0 and O, and such—one of the things OCR does very well is keeps numbers separated from letters. OCR can even be trained to recognize Handwriting if the letters are consistent!

Problem Scans

One thing that causes OCR to have fits is printed copy where segments of the letters are not connected, such as a xerox of a xerox or printouts that are too light and the letters are fragmented. This is also a problem if the scan is too dark and letters are not separated.

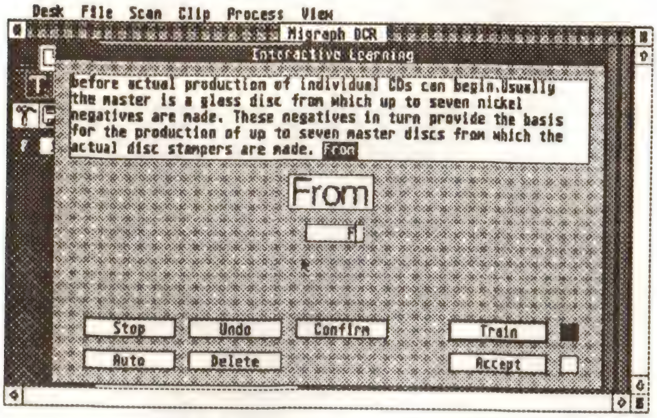
This problem is due to the method of character recognition OCR uses, that of using a mathematical description of the letters rather than a bitmap. The mathematical method picks up letters that bitmapping chokes on, however, it needs the complete form of the letter to work properly. The point of this whole discourse is to make sure you have a good printed image to scan from and that you do a good scan.

A way around this problem is during the "Interactive Learning Stage." When OCR sees letters (usually a,u,o,b,d), most fonts have thin and thick sections to these letters. These thin sections will sometimes be broken, and where lines are broken OCR will try to make letters out of the parts it sees. There is no way of combining these parts back together in OCR.

In the Interactive Learning Stage, you can define the most characteristic portion of the letter as the letter. Then, you can either delete the remaining "meaningless" sections or let the program do its thing. Once the text file is created, do a spell check to correct the errors. This will take care of 99.999% of those extraneous letter sections.

Installation

The installation of the program couldn't be simpler. You put the first disk in the floppy drive and click on the Install program. Then, you pick the hard drive partition on which you want OCR installed and what language to use as a default. The Install program does all the rest of the work. The Install program also gets deleted at this time, so only install from work disks (the work disks should be full disk copies, not file copies), not your original disks or backups.



before actual production of individual CDs can begin.Usually the master is a glass disc from which up to seven nickel negatives are made. These negatives in turn provide the basis for the production of up to seven master discs from which the actual disc stampers are made. From

Summary

I am using a four meg 520ST, a Canon page scanner and a hard drive. I would suggest a monochrome monitor (OCR also works in medium resolution if you don't have a monochrome monitor). It just looks nicer in monochrome to me.

The only problems I have had are ones of my own impatience while in the learning phase of the program, pushing the button too fast.

Early versions of OCR (prior to 1.05) had a bug involving the paragraph setting for output. If you have an older version, Migraph automatically ships the upgrade to version 1.05 when you send in your registration card. Future versions of the program will incorporate direct input support for various full page and flatbed scanners.

The program is quite goof-proof and very well done. The manual is small, but everything is covered in it. If you have need for Optical Character Recognition, I strongly suggest the purchase of Migraph's OCR. The program is simply excellent.

You've listened to your MIDI equipment. Is it listening to you?

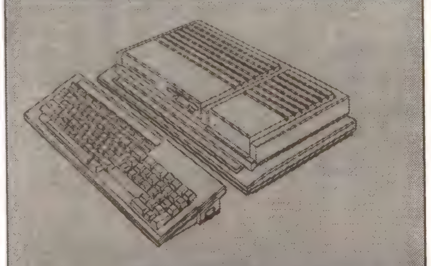
Megas & Monitors!



Mega STE Monitor Deals!

☛ We're hereby announcing a deal that will make your teeth sweat. Now, with the purchase of any Mega STE, in any memory or hard disk configuration, you can get a color or monochrome monitor at a substantial discount. And not only that, prices on the Megas have dropped anyway, so you can get a complete Mega STE system, with hard drive and monitor for the price you probably paid for your 1040ST system! Consider it. To upgrade your existing ST, you might have to spend as much as $1500 to get comparable RAM upgrades, accelerators, new TOS versions, hard drives, and detachable keyboards. For well under that price, you can get a brand new Mega STE, which includes all of those upgrades, not to mention the VME card slot (for expanded video) and Appletalk compatible network port. And it includes a monitor! Why don't you give your old ST to a friend or family member, or keep it as a spare. Remember, an upgraded ST is never as reliable as a new machine. Isn't it about time you stopped cramming things under the hood and thought about buying a new car? Now you can – *without feeling guilty!*

Mega STE Deals!

• **Mega STE** 1MB RAM	$849

Spring & Summer

☛ Winter is slowly but surely giving way to the warmth and raw flavor of spring, and our Spring/Summer catalog will be out very shortly. The Spring/Summer catalog will be our biggest and best printing effort yet! We're moving, too! A tremendously large location is being prepared for us now, and we should be in by Summer! We're not moving far, though — just across the street! Call for more information. Thanks for your continual support. We appreciate it.

NEW Little-Toad-20 Drive

☛ We've had numerous requests to create a drive suited for beginners and casual users. So we did. Now, you can get our Little-Toad-20 Drive. It features a high quality 20MB, 3.5" fast hard disk, in a portable, easy to handle case. Definitely one of our most popular 1992 introductions! Get yours TOADAY! At the tremendously low price of $299, it's a steal!

GET OUR CATALOG

☛ For our complete menu listing, be sure to call or write us to get a copy of our most recent catalog and to be placed onto our mailing list. No Atari connoisseur should be without our insightful reviews of hundreds of Atari products. Call us at Toad Computers TOADAY to get onto one of the most hip-hoppingest mailing lists around toaday! Get postcards, catalogs and more! All you have to do is call!

WRITING A BULLETIN BOARD ON THE ATARI 8-BIT, PART 2

James Bastable (BaPAUG)

In this second article, I will show you how to access the RS-232/modem port by means of XIO commands. XIO commands may seem, on the surface, to be complex but they are very easy to use. The fact that one XIO command can perform many functions often leads the programmer into believing XIO usage is confusing.

I will deal with each necessary XIO command in some depth and my lengthy explanations may appear to contradict my above statement. I can only repeat that, once studied, the XIO commands are very straightforward.

To illustrate this article, I have put together a short program which contains the necessary XIO and OPEN commands you need to write your Bulletin Board.

There is no need to type the program in if you do not wish to, as it does nothing spectacular. It is important, however, for you to study how each line of the program works. (See the program listing at the end of this article.)

Let's go through the program line by line:

Line 90 CLOSEs the channel, which is a very good habit to get into, especially when using the 850 Interface as you will see later.

Line 100 OPENs channel 1 to Port 1 of the 850 in Read Only mode (similar to the disk OPEN). It could have been set to Write Only (OPEN #1,8,0,"R1:") but not to Read/Write (OPEN #1,13,0, "R1:") as the following line would not work.

Line 110 is XIO command 34, which switches the DTR (Data Terminal Ready) and RTS (Request to Send) lines on. Unless this XIO command is issued, a lot of modems on the market will not enter into Auto Answer mode.

The number 240 in AUX1 in the XIO command sets this up. Again, this command is explained in greater detail later.

LINE 120 issues the STATUS command, the X variable being a dummy. When STATUS is issued, information about the condition of the port is updated in memory location 747.

LINE 130 PEEKs location 747 and checks whether it is equal to 253. If it is, the modem has made a successful connection. If not, the program loops back to line 120.

In LINE 210, the channel is again closed, because the port is going to be reconfigured.

LINE 220 is the XIO 36 command. This takes a little bit more explaining. All XIO commands have two auxiliaries in this form:

```
XIO COM,#CN, AUX1,AUX2, "Rx:"
```

COM equals the XIO number, in this case 36. CN equals the channel number, AUX1 and AUX2 are auxiliary 1 and 2 respectively.

In the case of XIO 34, auxiliary 2 did nothing and can do nothing. With XIO 36, both AUX1 and AUX2 are important in configuring the RS232 port.

Let's look at AUX1 of XIO 36 first. The value placed here tells the RS232 port what baud rate to work at.

The list at the top of the next column contains the corresponding values for the various baud rates.

Value	Baud Rate
0	300 BAUD
1	45.5 BAUD
2	50 BAUD
3	56.875 BAUD
4	75 BAUD
5	110 BAUD
6	134.5 BAUD
7	150 BAUD
8	300 BAUD
9	600 BAUD
10	1200 BAUD
11	1800 BAUD
12	2400 BAUD
13	4800 BAUD
14	9600 BAUD
15	9600 BAUD

A zero (or 8 in this case only) in AUX1 configures the port to 300 baud. To this AUX1, a second value can be added which tells the port the word size (the amount of bits in a single character) that will be used. You need not worry about this, as 99% of Bulletin Boards use 8-bit word length.

Value	Word Size
0	8 BITS
16	7 BITS
32	6 BITS
48	5 BITS

You would add the value from this table to the value for the baud rate you wish to work at. Now, to this value you can add yet another to tell the port how many stop bits must be sent with each word (99.999% of the time it's 1 stop bit).

Value	Stop Bits
0	1 STOP BIT
128	2 STOP BITS

In the program, I set the baud rate to 300 (value 0), the word size to 8 bits (value 0) and the stop bits to 1 (value 0). 0+0+0=0.

The second auxiliary of XIO 36 specifies which lines are to be monitored. The following chart indicates which value needs to placed in AUX2:

Value	Lines Monitored
0	NONE
1	CRX
2	CTS
3	CTS, CRX
4	DSR
5	DSR, CRX
6	DSR, CTS
7	DSR, CTS, CRX

CRX equals Carrier Detect, DSR is Data Set Ready and CTS is Clear To Send. In the program, I have opted to monitor all three. Why? Simple. By doing this, whenever someone drops carrier (disconnects unexpectedly), an error is produced which can be trapped in BASIC. This is very handy when you think about it, which I hope you do.

Once an XIO 36 has been issued to a port, it is remembered until you switch off the computer or reconfigure the port again.

Line 230 OPENs the port for input and output, which is what we need for sending and receiving data during the normal running of the Bulletin Board.

LINE 240 uses the XIO 38 command, which tells the RS232 what type of ASCII/ATASCII conversion you want, if any, and whether the RS232 will append line feeds. Both AUX1 and AUX2 are used.

Let's look at AUX1 first. The value placed here tells the RS232 whether you want *No Translation* (as in file transfer or if your Bulletin Board is going to work in ATASCII mode), *Light Translation* (which is the normal setting for standard ASCII communication) or *Heavy Translation,* which I never use because it tends to disallow some characters that may be needed.

Here is a list of values and their meanings:

Value	Translation
0	Light Translation
16	Heavy Translation
32	No Translation

Both Heavy and Light translation will convert ATASCII carriage return (155) to ASCII (13). They will also ignore the 8th (most significant) bit as all standard ASCII characters only use 7 bits. *No Translation* means exactly what it says.

To this value we can add another which sets the input Parity mode. A listing of these values can be found at the top of the next column.

Value	Effect On Input Parity
0	Ignore and Do Not Change
4	Check for Odd Parity and Clear
8	Check for Even Parity and Clear
12	Ignore and Clear

The first option (value 0) is the most common. To effect the Output Parity you can add one of the following values:

Value	Effect On Output Parity
0	Do Not Change
1	Set to Odd
2	Set to Even
3	Set to One

Once again, the first option (value 0) is most common.

AUX1 of XIO 38 can also instruct the RS232 whether to send a Line Feed character (ASCII 10) after a carriage return or not. Atari 8-bits don't need this, but there are some computers that do, so it really should be sent. Most computers that don't need the character appended ignore it anyway, so it does no harm.

So, having taken two values from the three tables and added them together, you can now add to this new value a 64 if you wish Line Feeds to be sent or 0 if not.

AUX2 of XIO 38 is only used when *Heavy Translation* is set. In this mode, whenever the RS232 ports receives data which cannot be converted to a recognized ASCII character, the RS232 changes it to a *won't translate character.* This character is set by placing a value in AUX2. On the very rare occasions when I have used this mode, I have placed a value of 126 (ATASCII Backspace) in this auxiliary, but any value between 0 and 255 can be placed here.

LINE 250 configures the port to Concurrent mode. AUX1 and AUX2 serve no purpose, so they are set to zero. Once Concurrent mode has been made active by XIO 40, the Break key is disabled, which is helpful as long as you are confident you won't need it. You can always press the Reset key if you get into trouble, but this can sometimes play havoc with the port configuration.

Annoyingly, you cannot access any other external device such as disk drives, cassette players, printers, etc. while the program is in Concurrent mode. There is no way around this, I've tried. Remember me saying it was important to get into the habit of closing a channel before using OPEN?

LINE 310 loads some text into the string BUF$. This isn't necessary in this case, the text could have just been PRINTed out to the port without being entered into the string first. When you come to actually programming a Bulletin Board, you will be reading text from the disk drive. Since you cannot have Concurrent mode active while reading from the drive, you will be pushing text into a string anyway.

LINE 320 PRINTs the contents of BUF$ to the RS232. Using the trailing semicolon suppresses the carriage return from being sent. This is not echoed onto the computer screen which, in the real world, would be so. A simple PRINT BUF$; placed here would do the job nicely.

LINE 370 and 380 clears the values in locations 747 and 748. These locations now have a different meaning when in Concurrent mode. Remember location 747 was used earlier for detecting a successful modem connection. I have not found a use for location 748, but the 850 manual says clear it, so I clear it.

In LINE 390, CNT is set to one, which is used to keep track of the amount of data that has been received and ANS$ is set to a null string where the incoming data will be placed.

LINE 400 issues STATUS, which updates location 747.

LINE 410 PEEKs location 747. Why? I wondered when you were going to ask! In Concurrent mode, location 747 contains the amount of bytes in the buffer. By checking if this is greater than zero, we know if data is coming into the RS232 port. As a matter of interest, the standard buffer size for the RS232 handler is 32 bytes, and if you don't get the data out quick enough you start to lose it. More about that later.

LINE 430 GETs a byte from the buffer, which must be available otherwise the program would not have reached this far.

LINE 440 checks to see whether the value gotten in line 430 is 155, which is an ATASCII carriage return. If the value is 155, then the program knows the caller has finished typing.

I know what you're thinking! You're saying to yourself, "All very well checking for a 155, but what if someone calls who is not using an Atari 8-bit and they send an ASCII 13, which is a standard code for Carriage Return?"

I say, "Aha, but the RS232 interface, being a clever little devil, knows this and converts it to a 155, so there." It also converts it back when sending. This option was set in line 240 using XIO 38.

LINE 450 places the data gotten in line 430 into the string BUF$.

LINE 460 increments variable CNT, which is done every time data is received other than ATASCII 155. Then, it loops back to get more data if possible.

LINES 520 to 590 simply loads text into BUF$ and PRINTs it out to channel 1. This time, no trailing semicolon is used, which means that a Carriage Return is sent (and a Line Feed, if a 64 was added to AUX1 of XIO 38).

LINE 640 CLOSEs the channel, as it is going to be altered. As a matter of great interest, whenever the RS232 port is CLOSEd, all the contents of the buffer is wiped. I sometimes close a port whenever a large amount of data corruption has been detected, just to clear out the rubbish...

LINE 650 OPENs the channel in Write Only mode. This is used because the following XIO command cannot be used in Concurrent mode.

LINE 660 turns off RTS and DTR control, which forces the modem to drop carrier. This is the opposite to the XIO 34 used in line 110. To calculate the values used, here is yet another table:

Value	Control
32	Turn RTS Off
48	Turn RTS On
128	Turn DTR Off
192	Turn DTR On

So you see, by adding two values together—128 and 32 equalling 160—both DTR and RTS controls are turned off.

Confused? Don't worry about it, so was I at first. But, I soon learned that a lot of the settings are unnecessary when operating a standard Bulletin Board. If you are planning on using RS232 for more specialized applications, I would suggest you study the matter more by obtaining the excellent manual for the 850 Interface. But general communications is nothing out of the ordinary, and so does not require you to know everything there is to know.

In the next article, I will be offering hints and tips on how to speed up data transfer from BASIC. When I was writing my first program, I was told BASIC could barely handle data at 300 baud, let alone 1200 baud which my own Bulletin Board runs at. I admit that I use Binary GET, which is built into BASIC XE, but I'll give you a Machine Code routine that simulates this command.

Before I go, a word of warning to Turbo BASIC users. When TB is loaded, it wipes the 850's RS232 handler, thereby preventing the use of any programs that use the RS232 ports. I will give you a program that will boot the 850 after loading.

Until next time.

```
10 REM A simple example of input &
20 REM ouput to the RS232 interface.
30 DIM ANS$(40),BUF$(500)
40 REM ----------------------------
50 REM -This routine detects if the-
60 REM -Modem has made a successful-
70 REM -connection.                -
80 REM ----------------------------
90 CLOSE #1:REM To be sure.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required.

$ 39.95

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945.

$14.50 ea.

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game.

$25.00

KEYBOARDS

New and complete subassembly.
Easy internal replacement.

130XE/65XE	$35.00
800	$40.00
800XL	$29.50

XL 40 PIN LSI CHIP SET

A Complete set of 40 Pin Large Scale Integrated Circuits for your 800XL, 600XL or 1200XL computer. Great for quick repairs! Set contains one each of the following: CPU, GTIA, ANTIC, PIA AND POKEY.

$ 14.95

800 5 PIECE BOARD SET

Includes Main Board, Power Board CPU, 10K O.S. and 16K RAM Board. All boards new, tested and fully populated. Set includes instructions that will allow you to repair ANY 800 Computer $28.50

1050 REPAIRS

We are now offering a limited repair service on the Atari 1050 Disk Drive. Please call our Service Dept. at 510-352-3787 for a Repair Authorization Number. Units without RA# will not be accepted. Service rate . . $69.95

SpartaDOS 3.2 and Turbo BASIC XL

An 8-Bit Atarian's Dream Comes True!

John Kasupski (WNYAUG)

It seems as if I've been lamenting the fact that SpartaDOS 3.x and Turbo BASIC XL are incompatible since it was still possible to step in fresh dinosaur droppings.

Actually, of course, it hasn't been quite that long. It only seems like it to me each time I had to read any text that explained why the two are not compatible and never will be (because both use the RAM under the BASIC ROMs in the XL/XE computers).

Then, the SpartaDOS X cartridge came out.

I recently had the chance to play around with a friend's X-cart and found you can run Turbo BASIC XL on an extended-RAM Atari by telling the DOS to use the extended RAM instead of the RAM under the BASIC ROMs.

At that point, I began lamenting my lack of an X-cart of my own, and my lack of the funds necessary to purchase one.

My lamenting ended the evening of October 19, 1991 when I logged onto the Wizard's Attic BBS. A version of Turbo BASIC that was supposed to work with SpartaDOS 3.2 had been left for me as F-Mail! Needless to say, I downloaded it, hoping it wasn't an early (or late) April Fool's joke.

It was not an early April Fool's joke. It was an early Christmas present!

And, judging from the number of people who have written letters to magazine editors and users' groups wondering if anyone knew of a way to get Turbo BASIC to work with SpartaDOS, this is pretty big news. It is possible to run the 400/800 version of Turbo BASIC XL with a modified version of SpartaDOS 3.2!

Everyone who said it would *never* be done, put that in your disk drives and boot it!

It seems John McGowan (author of some recent articles on TextPro that appeared in AIM) had a version of Turbo BASIC that works with the Atari 400/800.

Since these machines don't even *have* any RAM under the BASIC ROMs, John reasoned maybe it would be possible to use this version of Turbo BASIC with a disk-based version of SpartaDOS. But, alas, his initial attempts at doing so failed.

So, he uploaded the 400/800 version of Turbo BASIC to the Closer To Home BBS, where SysOp Tom Hunt had been working on a disk-based version of Atari BASIC (mainly due to the bugs in Atari BASIC Revision B)—a project which so far has produced CTH FastBasic.

Tom, not one to rest on his laurels (he's already written SnapShot, MTOS and other programs), was able to convert the 400/800 version of Turbo BASIC into a version that runs under a modified SpartaDOS.

This is only an alpha-test version, but I now have 22766 bytes available in Turbo BASIC on my 800XL. Considering that each of my attempts to run Turbo BASIC XL under SpartaDOS resulted in a total and immediate system crash, I'm quite satisfied with 22766 bytes.

I have yet to write a program that big anyway, except for when I was first learning to program in BASIC and everything I wrote was an unbelievable kludge.

I can now develop and use my Turbo BASIC XL programs under my favorite DOS.

My hat is off to Tom Hunt and John McGowan for their collaboration on putting the best BASIC for the Atari 8-bit on working terms with the best DOS for the Atari.

And, if by chance this article manages to find its way to those two gentlemen, here's one enthusiastic volunteer for beta-testing when the time comes!

Spelunker from Brøderbund
Revisiting a 1983 Atari 8-bit Game

Dale Wooster (NWPAC)

Webster's Dictionary says a Spelunker is "one who explores caves." Well, you can try to find the treasure at the bottom of this cave and not even get dirty.

Of the thousands of games that have come along for the Atari 8-bit over the past 10 years or so, only a few can truly be called *classics.* Spelunker from Brøderbund is one of those near the top of the list. It is a tough and challenging game for one player, with super scrolling graphics, some unique sounds and positive crisp play action.

Listen to the patter of the Spelunker's feet as he/she scurries throughout the cave picking up all the flares, picks, keys, dynamite and a couple items I'm not too sure about—but get them anyway as their point values count towards your point total.

You learn where to use the items you find as you get farther down into the cave, so *never leave anything behind!* You can use the elevator to start at any level you wish, but I found it's best to start from the top and *never go back up the elevator.*

Spelunker requires a *good* joystick.

There are also a few keyboard commands you will need to use. The spacebar, for instance, is used to kill the Ghost. You will hear the eerie sounds of the ghost approaching. It can come from *any* direction, so don't get caught on a rope or near the screen edge. Turn to face the ghost while standing on the dirt floor, and when he is a few inches away, hit the spacebar.

A blast from your air tank will blow him away. Use this sparingly as it reduces your air supply faster.

Another key fires a flare above your head. You use this when you hear and see the vampire bats flying above you. They live in the dark and hide from the flares. I think they are dropping "acid bat guano" on you because if it touches you, *you are dead.* Sending off a flare gives you enough time to run safely under them. If you feel *daring* you can run under most of them without a flare.

You set off dynamite charges by pressing yet another key. Get close to one of the mounds you can't jump over, set your charge, and then *turn* and *run like heck* the other way! If you place the charge in the right place, the mound will be gone and you can continue along that passage.

The lower left corner of the screen shows the items you have picked up along the way. At the bottom of the screen, a red "thermometer" gauge shows how much air you have left. There are plenty "air pump bellows" throughout the cave, but you will have to watch the gauge and move about carefully to avoid running out of air.

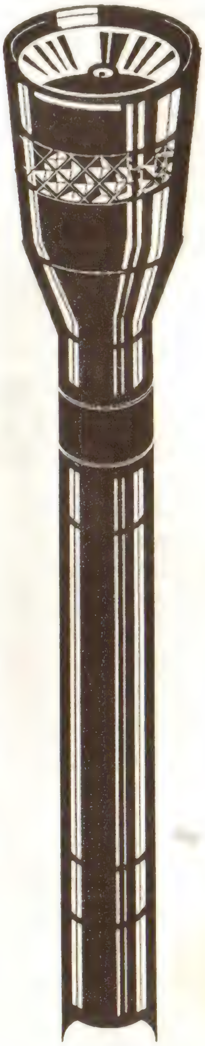
As you play, you will learn where the dead end tunnels are. Sometimes, you can pass by one of the pumps if you have plenty of air and you know you are coming back that same way, anyway.

You also must watch out for the smaller mounds that shoot out puffs of steam that can kill you. Some of the small holes will also kill you if you step in them.

In Spelunker, you earn extra lives by scoring points. As you get deeper into the *Ropes,* and then the *Falls,* the points you earn increase.

This game is so challenging that you will keep coming back to it as you learn all the twists and turns. I suppose you think I am going to tell you how to get through the Ropes and the Falls? Guess what! You're wrong. Have fun with this one.

Oh, one more thing. The disk will run a demo if you just let it load and go (boot without BASIC).



A-T-A-R-I

ANSWERS, TIPS AND RELEVANT INFORMATION

Paul Alhart (AFED)

This month I have several subjects to cover to bring things up to date. In the December '91 issue of AIM, I introduced MagiCalc XL. You can find this program on the March '92 AIM 8-bit DOM. Due to popular demand, I have since created a new version of MagiCalc. MagiCalc 800 looks exactly like MagiCalc XL, but was written for those of you using Axlon-type memory upgrades (Switching address $CFFF). As an added bonus, I have included a short BASIC program with MagiCalc 800 that allows you to pick the extended memory bank in which MagiCalc 800 will hide itself.

MagiCalc 800 is shareware and appears on this issue's AIM DOM (June '92). As with MagiCalc XL, you can also order directly from me. The registration fee is $6. For $10, I will include the complete, heavily commented, MAC65 source code. Please specify which version (XL or 800).

I want to take this opportunity to say "Thank You" to Jake Olbrich of RACC. In my A-T-A-R-I column (AIM Feb. '92) I told you about my handicapped friend, Jeff. In response to that article, Jake donated several disks of educational software. He also included valuable information regarding other sources of educational software that can be used by the disabled/handicapped. This is just one more example of the thoughtfulness of people in the Atari community. Thanks again, Jake.

In March '92, I told you about The Atari Federation Hackers Challenge and The Challenge appeared on the AIM disk that month. If you are still working on The Challenge you may want to stop reading here, for I am about to divulge its deep, dark, diabolical, hidden secrets.

You must have noticed things were not right when you first looked at the disk's directory from DOS and found nothing there but DUP.SYS. The Challenge makes use of several hidden directories. They are accessed by changing the values stored in memory locations 4226 LSB and 4229 MSB to point to the sector where the directory is to be found.

Their default values are 105 and 1. Therefore, the start of the Atari default directory is located at sector (105 + 1*256) or sector 361. This is the directory where I put DUP.SYS. Everything else is in other (hidden) directories.

After the title screen appears when you boot from this disk, you are given the prompt to *Let The Challenge Begin*. At that time, press and hold down the START key. At the READY prompt you will be able to LIST the program.

Line 500 of the listing gives you the first piece of the secret message *The Atari Federation*. Line 510 tells you (in a rather cryptic way) where the current directory is located, how to get to the next directory, and the name of the program you will be using. Type POKE 4226,110:LOAD "D:CLUE".

If you RUN "D:CLUE" you will be presented with a Graphics 7+ screen which will just make you see red. Instead, after CLUE has been LOADed, LIST it and change the first number in LINE 35 from 64 to 4. This changes color register 1 to a gold color. Also, it helps to change LINE 40 to read 40 FOR I = 1 TO 2000: NEXT I: STOP. This keeps the picture on the screen longer and keeps the program from sending you back to DOS.

Now type RUN to see the next part of the secret message—*Brings You*. Now LIST the program again and get your next clue from LINE 42. Type NEW to clear CLUE from your computer's memory and set up to use the directory hidden at sector 720. Type POKE 4226,208:POKE 4229,2.

Now you are ready to ENTER "D:ROOM". Don't type RUN yet or you will get the message ERROR- 9 AT LINE 9. LIST the program and you will see why. There is nothing but DATA statements and the instruction ?A$ in LINE 9. The trick here is that you are not in the ROOM you ENTERed anymore. ROOM is a magical little BASIC program written with Immediate Mode commands (No line numbers). ROOM DIMensioned, and put the next part of the secret message into, A$. It also changed the directory locations again and sent you to another ROOM, the program you just LISTed.

As soon as you ENTER "D:ROOM" type ?A$ or type GOTO 9 to see the third part of the secret message—*More For Your Atari*.

But what about all those DATA statements? And where is the next clue? Change line 9 to 9 READ D: ?CHR$(D);:GOTO 9. Now type RUN and you will see that all those DATA statements are the next clue, which is RUN "D:around".

The problem here is that DOS won't allow you to have lowercase characters in a filename. To get around this, POKE 3822,123. This patches DOS to allow all alpha characters from A-Z and a-z. Now type RUN"D:around" and you are on the final leg of your quest. Answer all the questions correctly and you are done. The correct answers are:

720 Sectors, 5 Players (The missiles can be combined to form a 5th player.), 2 Years, 64 Files, 65536 Bytes, 6502 CPU, 14 = $0E, 0 0 PAGE

That wasn't so hard now, was it? I had a lot of fun putting together The Challenge. I had even more fun listening to the exploits of my fellow club members as they tried to solve it. Most of them learned a great deal about their Atari 8-bits in the process. I hope you did, too.

By the way, did you really want to see what was in all those hidden directories? Without DOS, you couldn't just ask for a directory list like you are used to doing. Instead, type in and RUN this short BASIC program to see the contents of any directory you are using.

```
10 DIM A$(20):OPEN #1,6,0,"D:*.*"
20 TRAP 30:INPUT #1,A$:?A$: GOTO 20
30 CLOSE #1
```

AVALON HILL'S COMPUTER THIRD REICH

A WORLD WAR II GRAND STRATEGY GAME

DAVID ELMORE
ACCT

I began my Wargaming hobby almost 20 years ago. Fifteen years ago, I purchased a board game called "Third Reich." Ten years ago, I purchased my first Atari computer system, using it mostly as my opponent for wargames. When I read last year that Avalon Hill was releasing Third Reich for the Atari ST, I was more than happy. Last month, it was finally released. I'm thrilled, but I'm not sure you will be.

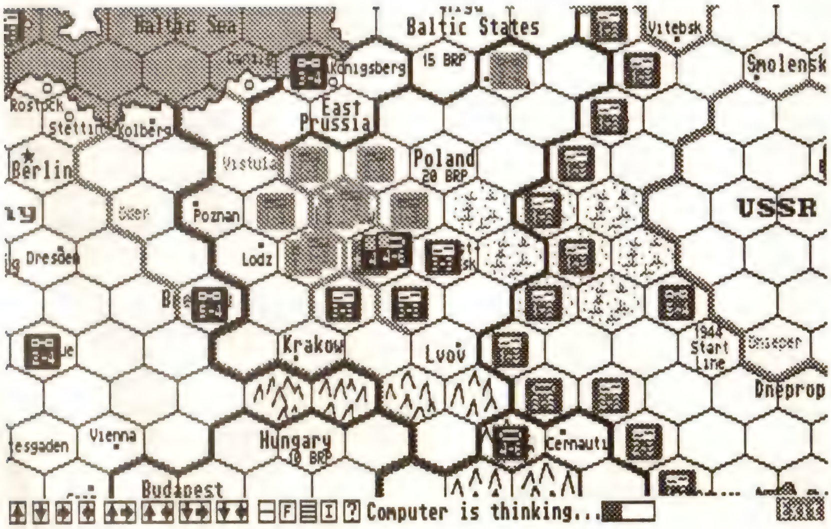
Display

Let me begin by stating this is graphically the finest computer board game I have ever seen. The designers have captured the game board almost exactly on the screen, down to the Combat Result Charts in the corners.

The map is of Europe from Spain in the West to the Ural Mountains of Russia in the East. Scandinavia is in the North, while the Sahara Desert of North Africa is in the South. The map scrolls 8 different directions using arrows located on the bottom of the screen.

You may split the screen, moving either the top or bottom half independent of the other. Other icons on the screen allow you to call up information about the game in progress to either screen half.

So, you can have information displayed on the top of the screen while you move your units on the bottom of the screen. You may also compress the map to get "the big picture," but I've found this to be useless. If you're paying attention, you'll already know what the "big picture" is. The Unit colors are bright; the map is very readable.



Computer is thinking...

Game Play

Game play is almost exactly like the board game. All the turn phases are still here. Each country (Germany, Italy, Great Britain, France, U.S.S.R. and the United States) take turns, first deciding what type of operations they wish to carry out (Pass, Attrition or Offensive) on each front (Western, Eastern or Mediterranean). Then, they move their units, conduct combat, build and place replacements, and finally conduct Strategic Redeployment.

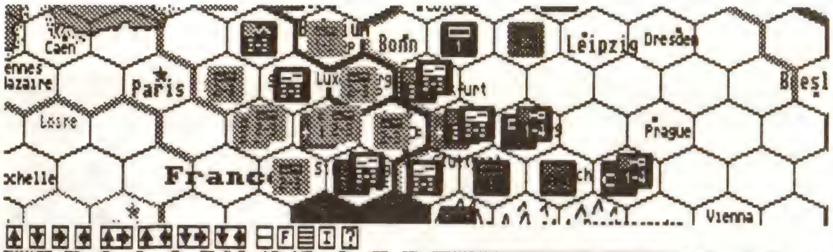
Unlike other games about the Second World War, this is no abstraction. The capabilities of each country are represented by its Basic Resource Points. These allow a country to build units and conduct operations. When you run out of points, you can't go on the Offensive or build replacements, so you must manage your resources wisely. Capturing other countries builds up your BRP base, making you stronger, but Bombers and U-Boats destroy BRPs, knocking you back down.

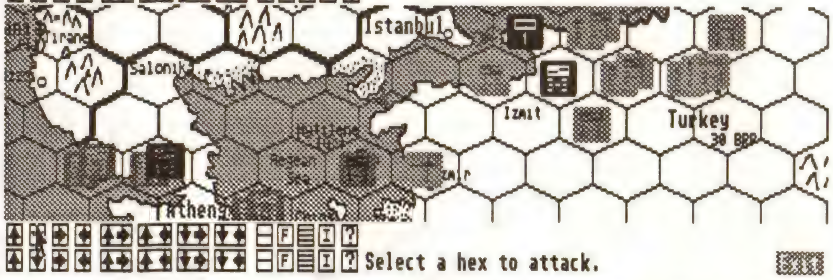
There are four scenarios in the game: the 1939 Scenario (Fall '39 to Summer '42), the 1942 Scenario (Spring '42 to Winter '44), the 1944 Scenario (Spring '44 until Berlin falls), and the Campaign Scenario (Fall '39 to Summer '45). Depending on the scenario, you can play the game against the computer in about 4-6 hours, longer against a human opponent.

Nice Touches

While playing against the computer, you hear pleasant "Thinking Music" when the computer is thinking. When the music stops, the computer begins to take its turn. During the Strategic Warfare phase, and during the game results, you listen to a *great* Boogie Woogie. The music is available on machines with one meg or more memory. On a basic 512K machine, the gameplay is silent.

This game feels like the original board game. You can see yourself moving the counters across the board, sipping Hot Cocoa while planning your next move. The die roll has been eliminated from combat. In its place, the appropriate Combat Odds column is displayed in the lower right corner and a bar slides up and down, stopping randomly on a result. The computer automatically keeps track of supply for you, surrounding units to destroy them through lack of supply is so much easier to keep track of. And you cannot make a mistake moving or in combat—the computer won't let you. *I really like this game!*





Select a hex to attack.

As far as game play goes, the first couple of times you play the computer, it'll sometimes do things you never thought of. It doesn't play very smart, pretty much straightforward. It doesn't even do things it should. But if you make a mistake, it will exploit it. If you leave a hole in your lines, you'll have enemy units swarming in your rear areas the very next turn!

Documentation

On the down side, if you don't know the board game, you're in trouble. First off, the Instruction Manual leaves *much* to be desired. As a matter of fact, it tells you if you really want to learn how to play this game, Avalon Hill recommends you either buy the Player's Manual or a copy of the board game itself! Put simply, without a copy of the 4th Edition Third Reich rules, you will be lost.

The instructions fail to tell you things like Terrain affects defensive combat values; or who the German minor allies are; or how Air and Naval combat works. Or even how to do Breakthrough and Exploitation, this being a *major* part of combat.

The instructions also fail to tell you how to get various country information to appear on the screen. Matter of fact, the docs fail to mention this information exists at all! I discovered it by playing around with the Information icons. Basically, the instructions fail to tell you not only how to play the game, but how to use the program. I strongly recommend buying a copy of 4th Edition rules from Avalon Hill through the catalog included with the program; the cost is $5.

Problems

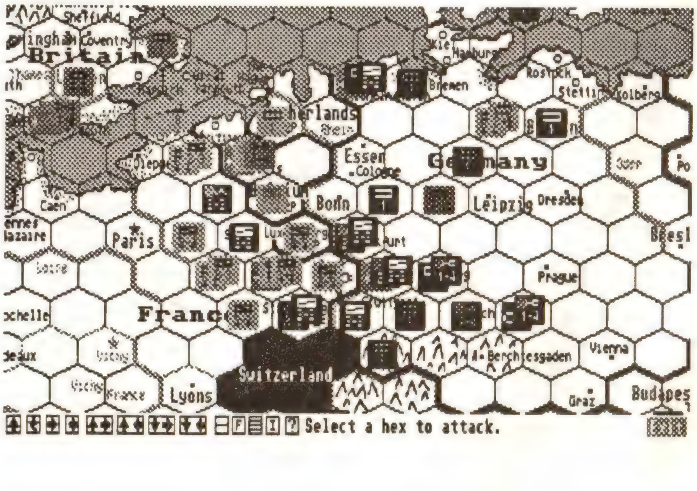
Also, I've had the game lock-up or bomb. Three times on a one meg machine, the game has bombed. The game has locked up numerous times on both the one meg and a 512K machine. Clicking the left mouse button starts the game back up again, but the computer opponent has been removed. You can place him back in the game, but this is an annoyance. Saving the game often is a way to make the lock-ups and bombs less aggravating, but for a commercial piece of software,we shouldn't have to worry about this kind of thing.

I've personally called Avalon Hill on the phone and FAXed them a letter with my gripes. I feel they have a quality product that has a few bugs left in it. They seemed to be responsive to my call and letter, thanking me for notifying them of my complaints and letting me know they are working to fix the problems.

Summary

In closing, if you know Third Reich and are willing to overlook the documentation problems, I strongly suggest buying this game. I've had hours of fun with it, against both a human and computer opponent. If you enjoy computer wargaming, are willing to spend $5 to get a complete set of rules, and can overlook the software problems, buy this game. You'll like it.

But, if you're a casual game player, you'll probably be too frustrated to enjoy the game.



Select a hex to attack.

REALISTIC
VIDEO POKER ©
3.0

Tim Bowles
CASTE

When I was a kid, I used to play Poker with friends. We used pennies as chips and it was our way of keeping score. We didn't know exactly how to play, so we sometimes made up our own rules, like "My married pair (King and Queen) beats your two Jacks." Nowadays, the friends are not always available to play, so I sit down with my Atari ST and play Realistic Video Poker from Micro Creations.

What's the Deal?

According to the manual, Realistic Video Poker (RVP) "was designed to be as close to the casino game as possible in both play and graphics." I have never played a real video poker machine, but this game seems realistic to me, except for the fact I have not been able to collect my winnings. (grin) RVP uses keyboard input rather than the mouse and this works well. There is no time-consuming "cute" stuff like picking up a coin with the mouse and dropping it into the slot.

You start out with a bank roll of 80 coins with which to play. You may insert up to five coins into the video poker machine. The payoff chart at the top of the screen is highlighted according to how many coins you insert. For those who like to play for the big bucks, pressing a key automatically inserts five coins and deals the cards.

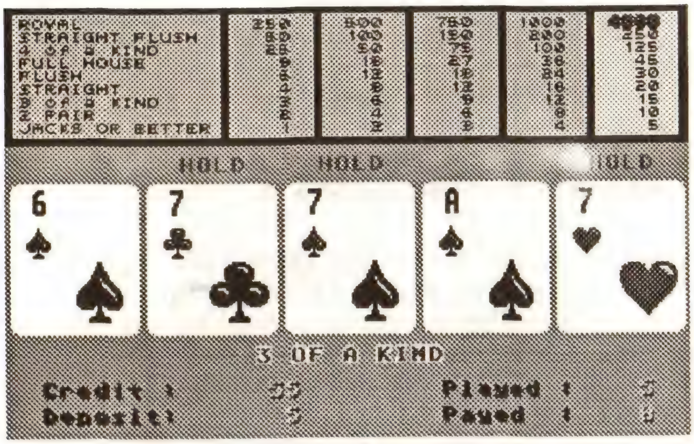
After the computer deals the cards, you may choose which cards to hold by pressing 1 through 5 on the keyboard. If you get a hand that's worth something, the computer tells you with an on-screen message such as Straight, Two Pair, etc. After you have chosen which cards to hold, pressing the Space Bar discards the rest. RVP then deals the new cards and will payoff on any winning hand as shown in the on-screen chart. When you win, you hear the digitized sound of coins falling out of the machine. Nice touch.

Other Features

If you wish to try to double your winnings, you can turn on the Double Down option. When you get a winning hand with this option on, you are asked if you want to try for Double Down. If you agree, the computer will then deal one card and you must pick a card of greater value to win. If not, then you lose it all.

If you feel like the machine you're using is not treating you right, you can switch to a new video poker machine with a freshly shuffled deck of cards.

High scores are listed in the "Tycoon Top Ten." There is also a Payout Report which keeps running totals on winning hands and how many hands have been played thus far.



Conclusions

The RVP manual is nothing more than a sheet of paper with a quick explanation of the game and a definition of hands. It gives no video poker strategies except to say get "one of the many books available on how to play video poker."

RVP is not copy protected, so it can be installed on a hard drive. It runs on any ST in low resolution only. Also, RVP has no problems with being DC Squished.

Realistic Video Poker is fun to play and would be good practice before you go to a real casino. It's better to lose imaginary money than real money.

Micro Creations, 4609 Millbrook Way, Bakersfield, CA 93313, 1-800-582-6351

NOW SHIPPING Ver. 1.2x

Micro Creations
Presents
G.I.M.E. Terminal
G.I.M.E. B.B.S.

G.I.M.E. is the best telecommunications programs on the market. The terminal provides many features that other terminals do not offer. Our multi-line BBS has a user friendly sysop GEM interface.

Features Include:
Largest built-in type-ahead buffer
Over 90 script commands
Background XYZ protocols
Auto-Z modem supported
Full GEM environment
Full-featured text editor
Multiple buffers
Graphics editor
Foldered dialer

Terminal $49.95
BBS (1 line) $49.95
BBS (Multi-line) $69.95

4609 Millbrook Way
Bakersfield, CA 93313

NEW! LogoLibrary™ Time Savers!

LogoLibrary™ consists of over 1060 images for desktop publishing. Includes over 600 printer's logos for business advertising, stationery, disk labels, etc. In addition there are 460 symbols and graphics for charts, posters, shirt designs, signs, etc. All images are hi-res 300 dpi graphics in .IMG format for PageStream, Touch-Up, Calamus, Wordflair, etc. Includes 6 d/s disks and 72 page directory. $39.95

Categories include Animals, Astrology, Barbershop, Building Trades, Business, Cars, Farming, Food, Gas, Gifts, Holidays, Home Furnishing, Industry, Insurance, Landscape, Music, Pets, Religion, Real Estate, Services, Sports, Signs, Statistics, Symbols, and Travel.

Qwikforms™ for PageStream™
Forms and Layouts!

The key to quick and easy, professional-looking forms and documents is Qwikforms™--the only package of forms with over 100 different, adjustable layouts. Just choose the one you want, insert your name, logo, or text, and print. Business forms include invoices, inventory control, real estate forms, fax forms, job estimates, applications, organizers, ledgers, charts, and more. Page layouts include newsletters, menus, flyers, letterheads, business cards, brochures, booklets, envelopes, press releases, resumes, and video production forms. Legal forms include wills, deeds, claims, bill of sale, power of attorney, etc. Personal forms include announcements, cards, architectural symbols for home planning, mail lists, invitations and many other unique and unusual uses of PageStream. Includes 2 free disks of PD clip art and other useful desktop publishing accessories. $39.95

Templicity™ LDW Users! VIP Users!
Home and Business Spreadsheet Templates

Now you can instantly use your spreadsheet to do your bookkeeping, income taxes, calculate mortgage rates, evaluate a car loan, estimate the maximum affordable price for property, balance your checkbook, design a savings program for education, create invoices, count calories, forecast income, and much more! This package of 104 ready-made spreadsheet templates covers everything from accounting and budgets to inventory and real estate. Interactive income tax templates are included and updated each year for only $5.00. Available in separate versions for LDW Power, Masterplan, and VIP Professional. $39.95

"Templicity is an excellent value and I highly recommend it." Amiga World, October 1990
"...a wealth of tutorial material..." ST Informer, Sept. 1988
"Templicity gives you ... a lot for your money." MACWORLD, August 1990

Cliptomania™ 10 full d/s disks of hi-res PD clip art in .IMG format for use with PageStream, Touch-Up, Calamus, Wordflair, and any program that can read .IMG files. Categories include Advertising, Animals, Cartoons, Fantasy, Holidays, Letters, People, Restaurant, etc. Over 360 images! $39.95

TripLink

A BBS and a Whole Lot More

David Scarpa
WMAUG

There are quite a few BBS systems available for the Atari ST. When I was looking for a good, solid BBS for our users' group, I decided to try some Shareware efforts.

There are numerous commercial BBS software programs. But, I believe in supporting shareware whenever possible, it being the real backbone of our software line. This search turned me to the online services, from which I downloaded and tried several BBS systems. None of them satisfied what I was looking for—ease of use for the users and ease of setup for me. None of them, that is, until I happened onto TripLink 3.5. I am now using version 3.7 and I am a registered user.

More than a BBS

The first thing that attracted me to TripLink was that it is more than just a BBS. Sure, it has that capability in spades, but it is also a front end file manager.

TripLink gives you control over your entire system through drop down menus and a command line environment. Via this software, you can run programs, move files and perform all the basic things you need to keep your system humming.

One of the very best things going for TripLink is the ease with which it is set up, a definite plus for Sysop novices such as myself.

The initial set up of the BBS requires you to create a TripBBS directory and place TRIPEDIT.TOS and TLINKxxx.PRG inside of it. You then must run TripEdit, answer the basic questions regarding your particular system and hit return. You then copy all the Data, Menu, and AD LZH files into their own folders. Finally, you run the TripLink main program and you're done! The initial BBS setup takes about three minutes and the program is automated to do most of the setup itself!

Features

An easy to set up BBS would be nothing if it did not have features, and TripLink does have lots of features. The newest version supports two sets of up to 32 message bases. The message bases set themselves up when you run TripEdit and answer a few parameter questions. These bases have all the usual features, including extended messages for long-winded folk, like myself.

In addition TripLink supports 32 files areas, all of which can be linked to specific message bases. The program uses the external XYZ program (itself a Shareware endeavor by Alan Hamilton) to allow Xmodem, Xmodem 1K, Ymodem Batch, Zmodem and Zmodem Batch downloads. Users with a specific access level can also be allowed to extract files from archives online.

TripLink also supports online games very nicely. I use both the Games area and a Doors Interface Program (DIP) to allow usage of games designed for FoReM and Turbo BBS systems. You can have as many as 32 games online in the Games area, and that's not including the ones handled by the DIP!

One of the nicest features of TripLink is the built-in TinyTerm program. With it, Chat mode is clean and effortless. TinyTerm can be used as a mini-terminal program, allowing you access to other BBSes. Using TinyTerm to connect to other TripLink BBSes gives you the ability to pull the user on the other end inside your own BBS. Also included in the latest version of the program are TRIPHOOKS. These are global switches that allow you to do numerous nice little tailoring things on your board.

This is just the tip of the iceberg when it comes to describing the features of TripLink. There are many others. While FidoNet and Binkley Terminal support is presently lacking, it could probably be added by an enterprising Sysop. If you are looking for a BBS with an easy to use interface, that allows for easy setup, and has all the message bases and file areas you could need, I heartily recommend that you consider TripLink. The program can be downloaded from the online services or from the author, Mike Caldwell, on the TripLink Support BBS at (916) 349-8517.

CSS Super E-Burner for the Atari 8-bit

A First Impression

Barry Gordon (ACCESS)

I was overwhelmed with excitement the day the UPS man delivered the box from Computer Software Services. I had very good reason to be. After all, I had recently ordered one of their most technically oriented devices, the "Super E-Burner." This device reads and programs (E)rasable (P)rogrammable (R)ead (O)nly (M)emory or EPROMs for short.

Whoa! That's jumping in a bit too fast. How about we take a few steps back and run over some basic concepts first? OK, here goes...

ROMs vs EPROMs

Inside your computer is a ROM (Read Only Memory) chip which holds the instructions that tell your computer what it is and how to operate. This Operating System chip (OS ROM) is a permanent component which does not need energy to maintain its data integrity. In other words, it doesn't go blank when the power is removed like a RAM chip.

The OS ROM chip is programmed with instructions when it is manufactured, and those instructions cannot be changed at a later time. An EPROM chip also retains its programming when power is removed, however, its programming can be changed.

An EPROM has a small window in the center of the top side of the chip. Erasing an EPROM is done by simply exposing this window to a high intensity ultraviolet light (Don't ask how, or we'll be here all day talking about transistor gate depletion levels and photo-electron velocities). But programming (commonly called "burning") an EPROM chip requires a special device. Enter the Super E-Burner.

Let's Get Physical

I had never seen a picture, nor heard a description of the physical aspects of the Super E-Burner. All I knew was that it plugged into the cartridge port of the Atari 8-bit computer and was incredibly fast.

After tearing the shipping box open, I pulled out a rather odd-looking device. The main unit of the Super E-Burner is a 5"x5" PC board which holds one power connection, four IC chips, 48 miscellaneous electronic parts, one 34-pin port and one ZIF socket.

What's a ZIF socket? Well, it stands for (Z)ero (I)nsertion (F)orce. It's an expensive socket that puts no pressure on the pins of an inserted chip. The socket has a small lever on its side. After placing a chip in the socket, pressing the lever down causes a metal plate in each hole to clamp down on the pins, thus making a solid electrical contact. Coming off the 34-pin port is a two foot ribbon cable that connects to the cartridge interface board. This board resembles a disassembled game cartridge, and is used in a similar manner.

Using the E-Burner

Despite the rather sparse and inadequate documentation which accompanies the Super E-Burner, operating the device is quite simple. The cartridge interface board plugs into the cartridge port and you then boot your computer with your favorite DOS. (For reasons unknown to myself and Bob Puff, this device does not work properly with SpartaDOS X). Upon entering the cartridge via a DOS command, the following menu screen appears:

```
+--------------------------------------+
| CO:01 NU:00  File:                   |
| Prom:0  Loc:00000  Write:00 Read:00  |
| Type:          Retries:0000   Speed:1 |
+--------------------------------------+
|       The SUPER-E BURNER 0.7         |
|  By: Robert Puff  (C) 1991 by CSS    |
|                                      |
|       [A] 2732     25V               |
|       [B] 2732A    21V               |
|       [C] 2764     21V               |
|       [D] 2764A    12V               |
|       [E] 27128    21V               |
|       [F] 27128A   12V               |
|       [G] 27256    12V               |
|       [H] 27512    12V               |
|       [I] 27C101   12V               |
|       [J] 27C301   12V (or mask ROM) |
|                                      |
| Select PROM type >                   |
+--------------------------------------+
```

From this menu, the EPROM size and programming voltage is entered. On this subject, the docs say nothing more than "Select the proper EPROM type. An incorrect selection of types can damage your EPROM."

I recommend you find some other references to help determine the proper setting.

Once the EPROM type is chosen, the main menu is presented:

```
+--------------------------------------+
|        Select Operation:             |
|[R] Read EPROM     [B] Burn EPROM     |
|[V] Verify EPROM   [E] Verify erase   |
|[N] # of copies    [Q] quit to DOS    |
|[S] Change speed   [ESC] New PROM size|
|[1-9] Disk directories                |
|                                      |
|Please Select >                       |
+--------------------------------------+
```

Although these menu selections are basically self explanatory, we'll run through them quickly. [R]ead copies the information from a programmed EPROM onto a disk file. [B]urn writes information from a disk file onto a blank EPROM. [V]erify compares information on a programmed EPROM to a disk file. [E]rase checks to make sure an EPROM is blank. [N]umber sets the number of EPROMs to be burned from a single disk file. [Q]uit exits to DOS. [S]peed alters the programming speed for older and slower EPROMs. [ESC] goes back to the previous menu.

Documentation Details?

Four stapled pages accompany the Super E-Burner consisting of a title page, a warranty page, a VERY oversimplified page of instructions and a page showing the orientation of different sized chips in the ZIF socket. I immediately called CSS and asked Bob Puff, "Is this it!?" He assured me they would be revising the documentation soon and talked me through the necessary concepts and instructions.

Within the documentation, a handwritten note says that CSS is working on a built-in editor which will support XE memory. This would make the Super E-Burner one of the most powerful firmware devices I've seen. A ROM chip could be read, disassembled, modified, and rewritten without loading up any other programs. Bob said the revised documentation would be included with the enhanced editor.

Observations

Now that I've had the Super E-Burner for about a month, I find myself rather comfortable with it. I have managed to backup every single ROM chip in the house onto my hard drive. That's over thirty chips including nine different Operating Systems for my 8-bit!

But the real fun of owning an EPROM burner is in firmware modifications. By disassembling, modifying and rewriting parts of ROM code, I've managed to make my 130XE run in high speed mode with my US Doubler drives, regardless of what disk/DOS I boot; I've made a stock 1050, US Doubler 1050 and an XF551 all respond to drive numbers higher than D4:; and I'm working on modifying my SpartaDOS X cartridge to use the standard SIO vector so it will work with a Multiplexer.

All things considered, I am very impressed with the Super E-Burner. It is a well built, extremely fast, and (so far) reliable unit. In my opinion, it is well worth the price (which, as of this writing, is $169.95 + $8 S/H). Kudos to Bob Puff and the gang at CSS!

ATTN: PAGESTREAM USERS

Introducing...

The Revolutionary

Mega-Kern©

Auto-kerning has arrived at last!

- Kern over 1000 kern pairs in less than 10 minutes, perfectly, without the usual headaches of creating kern pairs by hand!
- Creates kern pairs for either PageStream .DMF or Adobe Type 1 format fonts.
- Calculates optimum white space automatically.
- Mega-Kern Lite available for users who only need to kern PageStream .DMF fonts. (Great for Ultrascript users.)

Only $79.95 MegaType Lite $49.95

THE GOOFY GURU

That Pesky 8-bit Disk Drive Pad Problem

Charles Kelly (SNACC)

The Goofy Guru could have avoided a lot of disk drive problems if he had known this trick before—and now you can avoid them, too. When the pressure pad goes bad on a disk drive, you have all kinds of read errors and other hassles. And a company whose product is found on more desktops than IBM has the perfect solution. They recently changed a minor part of an important product that will provide the perfect replacement. It is the BIC pen.

Now, folks, please don't get cheap and use any pen you happen to have lying around. You want a new pen that has not yet been chewed on. Chewing on a pen will ruin the surface of the part we want. You are going to use the little piece that covers the end opposite the ball point. It is the *perfect* size for replacing just about any pressure pad, for any single-sided disk drive.

The Procedure

Just remove this "plug" from the pen and press fit it into the pressure bar on your drive. About the only problem is on a Tandon mechanism 810 drive. For this drive, you should drill a small 1/8-inch hole at about the same position as the old pad. Place a small board under the pressure arm to protect the drive head on these drives. Be careful. Don't drill very deep at all. You can use a small knife to expand the hole safely. All others—including the Trak, Indus, MPP 810s, 1050s, etc.—will already have such a hole where a very similar piece was fitted.

What makes this repair possible is a change in the plastic piece on newer BIC pens that is pretty close to the plastic pad that came with these drives. The change is important because you need a fairly hard plastic that will still not gouge holes in your disks.

A little problem like this can lead to foolishly sending your drives away for repair. Simply removing the cover and opening the drive up is usually more trouble than the rest of this repair. Just keep in mind that covers on Indus and Percom drives slide off while the other drives' covers usually pull off in two halves.

[The Goofy Guru series originated in the Southern Nevada Atari Computer Club newsletter and continues to irritate all. Topics covered are varied and obscure. In other words, this column is devoted to topics no one else seems to write about.]

Spreadsheet Design

Michael Bennett

Effective spreadsheet design includes the arrangement and format of cell entries, the grouping of cell entries into sections and the use of formulas so the spreadsheet can do the job for which it is prepared. Screen appearance, ease of data entry and printed reports are all purposes for design.

Figure #1 is an example of a spreadsheet that was entered with little attention to design.

FIGURE #1

```
           A              B            C            D            E

```

Figure #2 shows the same spreadsheet as Figure #1, but it has been formatted and arranged so it is easier to understand. These design features can be incorporated either when the spreadsheet is first entered or after the basic data has been entered and the calculations performed. You can save time, however, if you pay attention to the design of your spreadsheet before you enter it.

Figure #2 shows all dollar amounts with two decimal places and dollar signs (some spreadsheets do not have the dollar feature, but two decimal places still looks nice). Amounts that do not represent dollars are integers (no decimal places). Labels above columns are right justified with the numbers in the cells below. Different sections of the spreadsheet are separated and the column labels are underlined to make it easier to read.

Spreadsheet Uses

Spreadsheets may be used for many purposes. Your objective will determine the design. The three major purposes for spreadsheets are record keeping, analysis and forecasting.

Record keeping applications are the easiest to design because they show only the most basic data with just a few calculations. Fig. #2 is an example of a record keeping spreadsheet.

Analysis applications usually build upon the record keeping style of spreadsheet. In addition to simply recording data, though, they require you to analyze the results. Analysis applications often include functions such as finding percentages. Figure #3 expands on the previous example to include a percent of sales column.

Several formulas are included in column F to show each expense as a percentage of sales. Each formula divides the expense and profit by the sales amount. For example, the formula in cell F11 is E11/E8. The formula in cell F12 is E12/E8. Each of the formulas in column F use the cell contents of E8 as the denominator. When you copy formulas, you must be careful to specify whether the cell reference should be copied relatively or absolutely. Different programs use different methods for this, so check your instructions.

Forecasting

Forecasting applications use estimates to forecast future results. This type of spreadsheet takes advantage of the program's ability to perform "what if" analysis. With "what if" analysis, the user changes the input data and analyzes the various results. When you design

```

the forecasting spreadsheet, you should place the input data that will change in a separate part of the spreadsheet. That way, you can change data easily. Other cells may refer to your input cells, so you can simply change the input data to see the results, instead of changing all the cells individually.

As an example of a forecasting application, suppose you want to forecast the results of changing the price charged for a car wash. See Figure #4 and notice the changes to make forecasting easier.

Cells B12, C12 and D12 contain an absolute reference to Cell B5. So, when the user changes the price in Cell B5, all of the results change appropriately.

Another way of designing this situation on a spreadsheet would be to label all the input values in a separate section and label the profits as the results section, as in Figure #5. It is often difficult to separate input values from the results. For example, the Percent of Sales column actually contains the results instead of the input data. Fig. #5 shows that the user may change any of the expenses, the number of cars, or the prices to easily see the resulting profit.

When a large spreadsheet contains separate sections, it may be helpful to place separate column headings in each section. Fig. #5 can be displayed on one screen and probably does not need to have the column headings repeated in the Results section.

When you design a spreadsheet, you should enter information that will identify the spreadsheet to others who may view the report. You should also enter any other information that may be helpful to you. The upper left and right sides are good locations for such data entry. Proper design may also involve explaining the formulas, assumptions and inputs to be used. These explanations should be placed directly on the spreadsheet. Without explanatory notes, you may have to spend needless time reacquainting yourself with the spreadsheet when you return to it later.

Here are some good principles of spreadsheet design to help you produce effective spreadsheets:

1. Set objectives for the spreadsheet.
2. Plan and arrange the layout on paper first.
3. Set aside sections for the different parts of the spreadsheet.
4. Format the sections according to screen display considerations.

ST/TT Disk

All files on this disk are created with Double Click Software's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the June '92 disk. For more complete docs, see the text files contained in most of these archives.

ASTEROID.PRG—A great Asteroids game clone from the UK. Color only.

AUTOCPU.APP—Auto sets Mega/STE's CPU speed. Drops to 8MHz for "flaky" software, then jumps up to 16MHz with Cache when you exit back to the desktop. MegaSTE only.

FMTCPX.APP—Disk formatting CPX from Germany, with English documentation. You must have XCONTROL.ACC to use this extension.

HCOPY.APP—HCOPY from Germany is a disk copier that supports HD disks, 3.5" or 5.25" disks, up to 92 tracks and 21 sectors, backwards formatting for safety and virus protection. Shareware. Docs are in German, but the program is in English. Mono or Color, including TT resolutions.

ICCA.APP—I Can Capture Anything (ICCA) is a program to redirect output streams to files. You select the output device to redirect and the filename to which the redirected output will be stored.

JCLABELD.APP—An excellent label printing utility from the UK. Shareware. ST medium or high resolutions on ST/TT.

JOUTE.APP—Two player modem-to-modem tank combat game with a one player "practice" mode. ST low or medium resolution on ST/TT. Great graphics. Shareware from Canada.

JUMBLE.APP—ABC Jumble is an educational game that lets kids sort the letters of the alphabet after the computer jumbles them up. Point and click GEM interface.

MANYGOGO.APP—Similar to the Mac DA, this DA gives you your own personal GoGo dancer—up to seven of them, actually. For Adults ONLY. Do not use this DA if blatant male chauvinism or semi-nudity offends you.

MNET103.APP—Michtron NETwork by Jeff Wells networks your MBBS with other systems. Very easy to set up. Shareware.

OPLACE11.APP—Other Place is a one person asteroids-like arcade game. Mainly shoot and dodge with a little maze action. All ST resolutions.

RUSSIA.APP—Two utilities from Russia! A_Format is a floppy disk formatter with some interesting options. BootInst installs a smart boot sector allowing you to enter time and date at bootup, continue boot process from Drive B and more. English prompts in both programs.

SEARCHME.APP—Word search puzzle generator. Save and load or print puzzles. Create custom word lists, use the supplied dictionary or use the dbWRITER wordprocessor dictionary. ST mono only on ST/TT.

STARNUKE.APP—StarNukers 1.02D, a two-player, real time, modem-to-modem space war game. ST medium or high resolution on ST/TT. Shareware.

Mac/Spectre

Each AIM Mac/Spectre Disk of the Month is a double-sided disk packed with some of the best PD and Shareware programs available each month. The disks are available in either Macintosh or Spectre formats. All files are self-extracting Compactor Pro archives. Just double click to extract!

Here is a short description of the files contained on the June '92 Mac/Spectre Disk of the Month:

AltCDEF—This init modifies the scroll bars in all of your Mac's open windows to have double arrows at each end. No more moving back and forth from one end of the bar to the other when making fine adjustments!

CarpetBag 1.1—A utility that works in much the same way as Suitcase II or Master Juggler. That is, it allows you to use fonts and DAs without actually installing them in your System file. CarpetBag doesn't have as many features as the commerical programs, but it's a lot cheaper.

SmartKeys 2.1—Init/CDEV typist's assistant that can be configured to help prevent common typing errors, such as typing two capital letters in a row. It also can be configured to change standard quote marks to smart quotes. A very useful utility.

eMACs 3.0—The latest version of the popular eMACs text editor for the Macintosh. All the standard commands are supported and most commands can be chosen by either a mouse click or from the keyboard.

Definitive Desserts 1.2—A HyperCard 2.1 stack full of great dessert recipes. If you've got a sweet tooth, you'll find something you like here.

Home Inventory—Another HyperCard 2.1 stack. This one can help you keep track of all your stuff. Very nicely done and easy to use.

DISKS OF THE MONTH

Disk

Stella Obscura—In this archive you'll find a great 3D space shoot 'em up game. To get the 3D effect, you need to make a special viewer from a cracker box (really!). The docs include instructions for making the viewer.

Bonk 1.2(b&w)—In this game you "bonk" a little guy each time he pokes his head out. Trust me, it's more fun than it sounds.

The Grouch—The init in this archive places Oscar the Grouch from Sesame Street in your Trash Can. Each time you empty the trash, Oscar raises his head and sings. A very nice animation and lots of fun. You may find yourself deleting all your files just to watch him do his thing!

> Readers can purchase this disk from their local AIM participating user group or by sending $6 ($5 +$1 s/h) to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, or call (313) 973-8825 and have your Visa or MasterCard handy.
> Please specify the June '92 ST, Mac or 8-bit Disk when ordering. When ordering the Mac/Spectre Disk, please indicate Mac or Spectre format.

8-bit Disk

Each AIM 8-bit Disk of the Month is a single-sided, single density "flippy" packed with software. To extract files in the ARC format, you need the UNARC.COM utility. To decompress files with a DCM extension, you need DISKCOM3.UTL. Both programs are available from most BBSes, user groups or you can purchase the April/May '91 AIM 8-bit Disk.

Here's a short description of the files on the June '92 8-bit disk:

SIDE 1

CTH_FB.ARC—CTH Fast Basic will be a welcome addition to the libraries of BASIC programmers using SpartaDOS 3.2d. It's an extremely fast interpreter for XL/XE users. Fast Basic provides 28,119 bytes of free memory for your BASIC programs. Features include a screen accelerator and a customized, fast floating point package (based on code by Charles Marslett). Docs included. Written by Tom Hunt.

DEMO2.ARC—An excellent demo from overseas. Press RESET to move from one stage of the demo to the next.

FILEDEMO.ARC—Demo of the File Information Manager, a disk library database manager. Each file entry can include a 128-character detailed file description. Features include interactive search, two description fields, and ability to read disk directory into memory. Written by Larry Richardson (ACCD).

HVYMETAL.ARC—An excellent game from the UK and Page 6 magazine. Wander through the mazes and find the lost jems. To move from maze to maze, press the fire button while on the "pads." Joystick required.

MCALC800.ARC—MagiCalc 800 is a new version of MagiCalc XL. It is identical to the XL version, except it is written for machines that use Axlon memory bank switching instead of XL/XE bank switching. Includes documentation and a BASIC program to modify MagiCalc 800 to load itself into the extended memory bank of your choice.

SIDE 2

BGAMES.DCM—Three games—Catch 88, Knight Moves and Othello—written by Simon Trew of the LACE club in London, England. This discomm file includes drivers for joystick, mouse, touch tablet and trackball. Use Discomm to decompress to a blank SD disk, then reboot. Once at the DOS menu, load the appropriate driver, then run the games. NOTE: Plug your input device into Port 2!

LITTLE.ARC—This demo may be little, but it still is impressive. From the High Tech Team. START and OPTION keys move you from one stage to another.

VTEX11.ARC—VTEX is a utility that allows you to view any file on the screen. It's much easier to use than TYPE or COPY to E:. VTEX can page through a file, both forward or backward. Features include pseudo-word wrap, deletion of leading spaces from left margin, string search capability, ASCII CR/LF handling and built-in help. Written by Larry Richardson (ACCD).

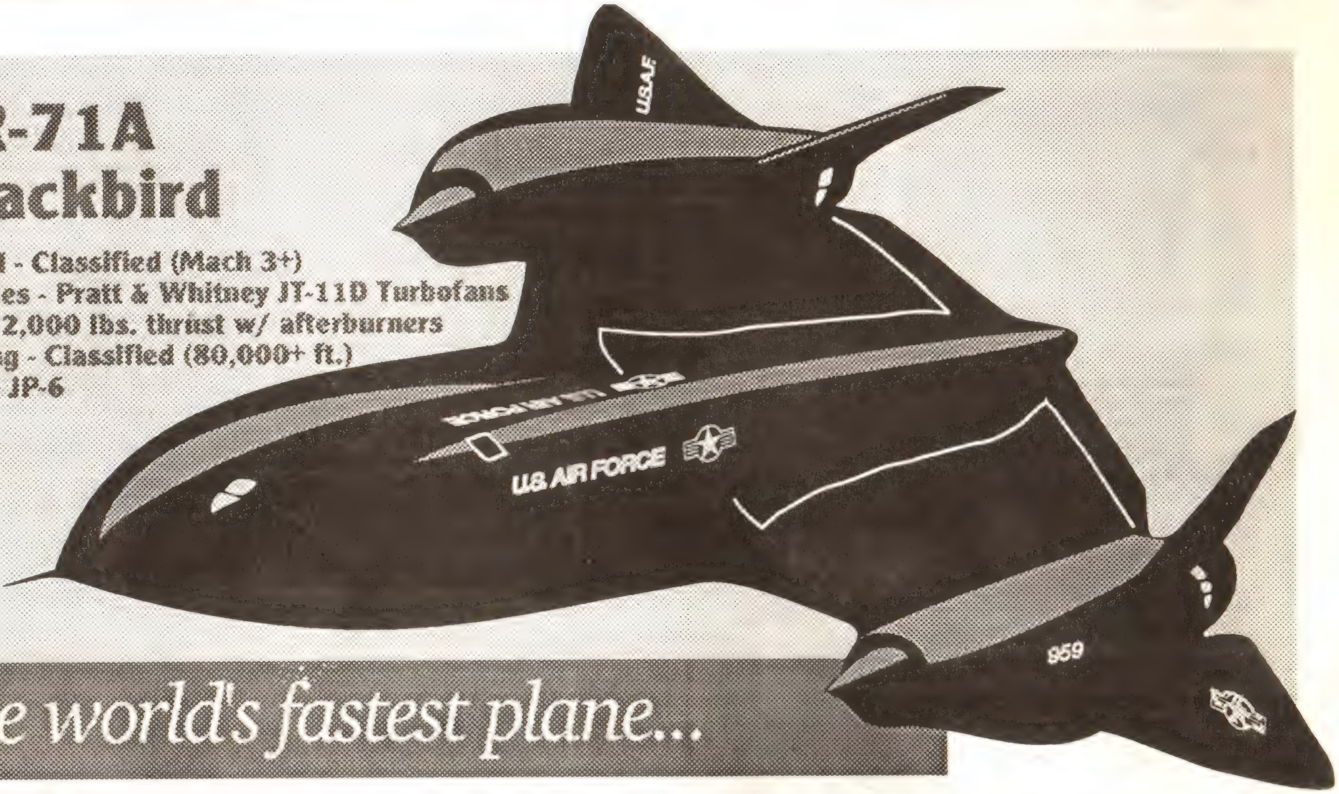
feel the need... THE NEED FOR SPEED

SR-71A Blackbird

Speed - Classified (Mach 3+)
Engines - Pratt & Whitney JT-11D Turbofans
32,000 lbs. thrust w/ afterburners
Ceiling - Classified (80,000+ ft.)
Fuel - JP-6



the world's fastest plane...

SST

...the world's fastest Atari

Introducing the fastest, most compatible, most flexible accelerator available for the Atari Mega ST: the splendiferous totally cool ***68030 SST****. With its screamingly fast 68030 microprocessor, up to 8 meg of fastRAM (to 12 meg total), asynchronous design, and special compatibility software by Dave Small, the SST is any "ST pilot's" dream...*

...The dream can be ***yours****! So bring your Mega ST into the 90's, and turn it into one of the fastest machines on the planet!*

From the people who brought you Macintosh emulation on the Atari (and whose Dad actually flew the SR-71).

SST prices start at $599.00

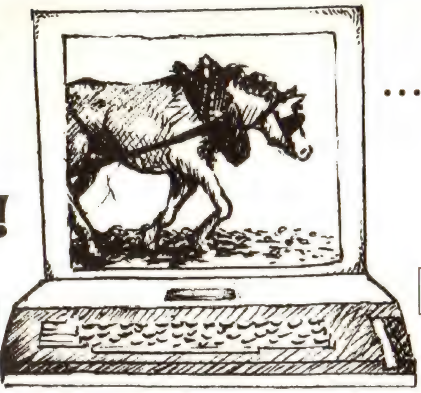
68030 SST

Speed - 18 to 40 MHz asynchronous design; up to 12 times faster than a Mega ST
Engine - MC68030 Microprocessor with Caches and Burst Mode Afterburner
Ceiling - up to 12 Megabytes of RAM
Fuel - up to 8 Megabytes of 32 bit fastRAM in tandem with a 20 or 33 MHz oscillator
Operating System - TOS 2.06 (Mega ST^4), with the new Atari desktop
Expansion - processor direct slot; Chromax Super Video board already "in rollout"
User Upgradeable - when ever you want to

Gadgets by Small SSTSSTSSTSST

40 W. Littleton Blvd.; #210-211 • Littleton, CO 80120 • (303) 791-6098 • Fax (303) 791-0253

Make your 8-bit a Workhorse!



...with power products from Computer Software Services

Power Products for your XF551

$99.95 THE XF SINGLE DRIVE UPGRADE $99.95

Double the storage capacity of your XF551 with our 3.5" 720k **single drive upgrade!** Included with the upgrade is a Sony 3.5" disk drive in a 5.25" faceplate that perfectly replaces the existing 5.25" drive. The 3.5" drives are newer technology, more reliable, and easier to handle. Do NOT confuse this with public domain upgrades! The completely re-written drive OS adds these features:

- **Fixes incompatibilities** with commercial software
- **Eliminates** density **reconfiguring problems**
- Switches to second side without reconfiguring
- **Ultra Speed** I/O compatible
- Very **high speed** sector skew in US mode
- Capable of reading **IBM** and/or **ST** disks
- Compatible with 40 OR 80 track drives

Included with the upgrade is a utility program capable of reading IBM and/or ST disks, so you can import text or binary files to your 8-bit (text conversion routines are included). Minimal soldering is required; but we provide free installation for any of our products! Only $99.95 plus $8 S/H/I. If you already have a 3.5" drive, you may obtain the single drive upgrade without the Sony drive for $59.95 plus $5 S/H/I.

$139.95 THE XF DUAL DRIVE UPGRADE $139.95

Our XF Dual drive upgrade allows you to **add** a 3.5" drive to your XF551, while keeping the 5.25" mechanism. This is a totally **switchless** upgrade that turns your XF into two disk drives! The added 3.5" drive assumes the next drive number higher than the 5.25" and is totally independent, so you can copy between drives, even mixing densities! This product has all of the features of the above single drive upgrade, available for **both** drives! Complete with Sony 3.5" drive, only $139.95 plus $8 S/H/I. The upgrade without the drive is $79.95 plus $5 S/H/I. A special version to handle dual 3.5" mechanisms is available for an additional $20.

THE FLOPPY BOARD $109/149

The Floppy Board has arrived! This long-awaited Black Box add-on has been in the making for quite a while, but we've packed it with features that are worth the wait! This sophisticated device allows connection of up to four 5.25" or 3.5" floppy drives (drive sizes may be mixed). Access to these drives will be at parallel bus speed, approaching that of hard disks!

The board consists of 13 special integrated circuit chips, fully powered by the power supply of the Black Box. It has its own on-board microprocessor to take the load off the computer's processor for disk I/O. The board and fits perfectly over the Black Box (inside the custom cases!). It is not a stand-alone device; it must be used in conjunction with the Black Box.

High density disks are supported, so 1.2 meg 5.25" and 1.44 meg 3.5" drives may be connected. This is the only 8-bit controller to fully support these drives and densities! With four 3.5" 1.44 meg drives connected, you can achieve more total storage than a 5 meg hard disk! Archiver compatibility is supported! This means you can back up those titles no longer available. Although it's not as powerful as our Super Archiver, it will have the same editing power, with good backup capability.

Software included with the Floppy Board includes a utility to READ and WRITE IBM and ST disk formats! This will yield the easiest possible way to port text and data files between your 8-bit and ST or PC! This will be compatible with most all of the current formats. Also included is a high-speed sector copier designed to make extremely fast, verified copies of disks. A future upgrade to the Hard Drive Pro Backup (our hard disk backup tool) will make special use of the floppy board, and squeeze even more data on each disk than standard formats allow. It is possible to actually store 1.6 megs of data on a 1.44 meg 3.5" drive, so backing up a full 20 meg hard disks might only take 14 disks! Usage of the Floppy Board's on-board processor will allow overlapping reading and writing, making the backup really fly.

Two versions are available: the basic unit, and the Deluxe version. The basic unit provides the interface necessary for low density drives (360k for 5.25" and 720K for 3.5"), and comes with the IBM/ST transfer utility. The Deluxe version adds the high density capability, adds Archiver compatibility, AND adds the features of the Black Box Enhancer, which include a high-resolution 16 grey scale printer screen dump, and a powerful built-in sector editor, disassembler, and copier (which accesses the full 16 megs possible of hard disk partitions, and uses all available extra memory). Note: the Floppy Board replaces the ROM on the Black Box, so current Black Box Enhancers cannot be used with the Floppy Board.

The basic unit is only $109.95, and the deluxe unit is only $149.95. Add $5 for shipping/handling.

Power products for your XL/XE computer

~~$69.95~~ THE ULTRA SPEED PLUS OS ~~$69.95~~

The Operating System that should be in every XL/XE computer! The **ULTRA SPEED PLUS** puts unbelievable speed and convenience at your fingertips. After using it a while, you'll wonder how you ever got along without it! Use **ANY DOS** to place **ULTRA HIGH SPEED** formats on your disks (with XF551 or modified 1050 drives), reconfigure and boot any drive (1-9 or even your **RAMDISK!**), sector copy single and double density disks to your RAMDISK, activate a built-in **400/800 OS** for compatibility, and much more! Below are a list of features. Only $59.95 + $5 S/H/I.

- **ULTRA SPEED SIO** for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from RAMDISK
- Special timer circuits not required for 1 and 2 megs
- Background colors adjustable
- Reverse use of **OPTION** key
- Toggle internal **BASIC**
- Built-in drive number editor (including RAMDISK drive)
- Toggle screen off for up to 40% increase in speed
- **DOUBLE DENSITY RAMDISK** handlers
- **ENTIRE MEMORY TEST** that pinpoints defective RAM chips
- Boot any drive (1-9) on cold start
- Supports ALL XE-compatible memory upgrades up to **two megabytes**
- **THREE** Operating Systems in one **(XL/XE, 400/800, ULTRA SPEED PLUS)**
- **COLD-START** without memory loss
- Built-in mini sector copier
- **RAMDISK** exactly duplicates floppy drive so sector copying and editing are possible

$199.95 THE BLACK BOX $199.95

The **BLACK BOX** is a parallel-port device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It is a T-shaped board with two buttons, two switches, and a set of dip switches visible from the outside. The **BLACK BOX** performs three main tasks: interface to a SASI/SCSI bus (for interface to most common hard disks), a parallel printer port, and a RS232 (modem) port. You may partition your hard disk(s) into as many drives as you wish; up to 9 may be active at any given time. By pressing one of the buttons on the **BLACK BOX**, you will enter the configuration menu, where you can re-assign drive numbers, swap partitions in and out, etc. When you exit, you will be returned to your program – undisturbed! Each hard disk partition has its own write-protect flag, and may be set to single or double density. Every hard disk may be write-protected with the flip of a switch. As an option, you may use your computer's XE RAM as a printer buffer, or order the BLACK BOX with 64K of on-board RAM.Another amazing feature of the BLACK BOX is the built-in **screen dump**. By simply pressing a button, the contents of your screen will be dumped to your printer! (You can define text or graphics modes with a switch!) The RS232 port supplies the full spec signals for added compatibility. Its handler takes up no user memory, and can handle 19,200 BAUD! A **machine language monitor** has been added to allow memory disassembly, memory/register changes, and more. The basic **BLACK BOX** unit is $199.95, and $249.95 with 64K RAM (for printer spooler). S/H/I is $8. An optional custom BLACK BOX case is available for $39.95. The Black Box is a product of Computer Software Services... Not the Black Box Corporation.

HARD DISK SYSTEMS

We offer complete, ready-to-run hard disk systems from 5 megs on up! These systems include a hard disk, Black Box, power supply, controller, cables, and software. Everything is pre-formatted and tested, so all you have to do is plug it in and boot! Prices start as low as $399. Call for the latest prices and specials!

INSTALLATION AND REPAIRS

Althoough installation of any of our products is easy, by taking advantage of our free installation offer, you can rest assured it will be done right. All you pay is the freight charges.
For repair of Atari 8-bit computers and drives at reasonable rates, contact our repair department at (716) 429-5639. All work is guaranteed, and there are no minimum estimate fees.

TWO FOR ONE DEAL!

If you have two or more of the same items needing repair and don't want to spend any money... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE - we'll keep the other defective one for parts! Please call before sending anything in.

We carry many other items - call for our FREE catalog!

Dealer/Distributor/User Group discounts available–call for info.

We accept VISA and Master Card. NY Residents please add sales tax.

Calligrapher

The Ultimate Writing Machine.

It's been a long time coming, but world-class word processing has finally arrived for Atari computers! Calligrapher combines desktop publishing features (like scaleable fonts and built in graphics) with an intuitive, easy to learn word processing interface. The result is a uniquely powerful and infinitely flexible tool—the only writing tool you'll ever need!

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs are preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari TT/030, HP Laserjet II with PacificPage PostScript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.

Editorial Ramblings

This is going to be a rambling editorial for sure! Instead of focusing on any specific editorial topic or discussing what's contained in this issue, we're instead going to jump around from topic to topic with wild abandon. Don't try this at home, kids!

First, we very much appreciate the letters we receive from our readers—positive or negative in content, they are always informative and helpful to us. From time to time, though, we receive letters from users asking for help or reply...but no phone number is given in the letter. We just can't possibly reply via US mail to the letters we receive. If you want us to reply—and we'd be happy to do so—please give us a phone number where we can contact you. Or, if you have an account on CompuServe, GEnie or Delphi, we'd be happy to reply online.

Speaking of the mail system, it's *very* important that US-based subscribers notify us (or your user group for participating club members) of *any* change in your address. If your AIM address label is incorrect in *any* way, the Postal Service will not deliver your issues.

Also, if you move and want to receive any copies of Atari Interface "in the pipeline" before we receive your change of address, you *must* fill out a form at your Post Office indicating that you are willing to pay to have your 3rd Class mail forwarded to your new address. If you don't do this, the Postal Service throws your issues in the dumpster.

Since we (or your users' group) cannot be held responsible for lost issues due to incorrect addresses, it's your responsibility to 1) let us know of your address change ASAP and 2) make arrangements with your Post Office to receive copies of AIM already in the mail system. It's much better to do this than to miss an issue or two (or end up paying $3 postage each for us to send you the issue(s) you missed).

From The Reader's Viewpoint

Dear Editors,

I have not subscribed to the disks on an annual basis because I receive so many magazines and disks each month, and there is a lot of duplication.

In the case of the 8-bit disks, they have been of excellent quality and variety. It just so happens that I have a great deal of the material covered or do not have/use such items as Diamond, GOS, Textpro or Basic XE. Nevertheless, the variety is extraordinary. Somebody's doing a very good job getting material together.

I have some programs I was going to send to Atari Explorer, but their info-pack for authors seemed to discourage the sending of any 8-bit type-in programs. Some of my programs are unique and original; some are conversions and enhancements of other programs. Most need some polishing or documentation.

I have a question for David Plotkin (or anyone else who might know). I, and many, many others had material published in STart/Antic and was not paid. I'm not interested in the money part so much, but I do wonder what the status of the material used is.

To Bill Rayl—I have been waiting for some reviews of Silhouette, MegaPaint and Arabesque. There have been some, and good ones too. However, it was very difficult to decide, with such a multiplicity of programs with overlapping capabilities.

Imagine my elation to find the near-perfect review which compares all three at once! I am overjoyed! However, my worst fears were confirmed when your conclusion was similar to mine. It's hard to choose one over any other. However, it is useful to be able to at least prioritize my needs a bit more efficiently.

I have a Star NX-1000 Rainbox printer and have been very impressed by a program called Flexi-Dump Plus, a demo of which was in a recent issue of ST Format. Nobody seems to have heard of it (I have no dealers near by).

The demo was spectacular in its capabilities even with a number of options crippled. Deluxe Paint allows you to print out your 16 chosen colors to see how they match your expectations. That is nice, but FlexiDump seems to match colors almost automatically. It is also very fast!

In the same vein, I have been interested in an HP Deskjet 500 printer. Computer Friends in Oregon offers replacement ink cartridges in multicolors (including CMYK). I wonder how plausible it would be to separate colors (PageStream) and run the same sheet of paper through four times to get full color?

On the other hand, there is the new HP Deskjet 500C color printer. I understand it uses CMY without black. I have seen no reviews on this yet. Unfortunately, other great looking color printers are priced too steeply for my needs.

As a former commercial photographer, I must compliment you on your excellent color covers. The era of the slick commercial magazines like STart seems to be over for the present. I find the usual computer magazines like Compute! and PC Home Journal full of incredibly boring material. Games are well covered by ST Action. ST Format presents a variety of material well, but again, there is not the depth in their reviews.

I see the push to get an 8-bit magazine is going just so-so at best. While I still use my 8-bit quite a bit, I question whether a whole magazine full of information will be that easy to come up with on a regular basis.

I continue to enjoy my Atari computers and look forward to the future. One problem...the new Falcon sounds so interesting, I will probably put on hold getting an AdSpeed accelerator for my STe! On the other hand, the STe has been out for a couple years, and not much software has taken advantage of it yet. I hope some developers can get a little ahead of the Falcon and have something for us to use in a reasonably short time. The TT or STT solution goes beyond what I need.

Thank you for a continually improving and always enjoyable magazine.

Sincerely Yours,
Frank Kweder,
Fort Meyer, FL

If anyone asks, tell 'em you saw their ad in AIM!

Blue Ridge AtariFest Show Specials on Hard Drives now in effect!

why settle for anything less ...

computer studio *file*

Case measures 6.9" x 6.0" x 10.5" and is color matched to Atari's TT030 (light beige). Assembly includes case with 50W power supply, power switch, LED power light, fan, removable power cord, two half height 5.25" drive bays, internal SCSI cable with two 50 pin drive connectors and two external 50 pin Centronics connectors.

Other sizes also available. Call for pricing.

Case alone (as described at right) ... $119.00

Case with ICD AdSCSI Installed (complete with DMA cable and software - ready for installation of your hard drives $239.00

Complete Systems: with case, cables and ICD AdSCSI

50 Mb Hard Drive System (3.5")	$419.00
105 Mb Hard Drive System (3.5")	$579.00
Syquest 44 Mb Removable System ..	$619.00
Syquest 44 Mb Removable with any of the above drives, add	$400.00

ATARI BULLETIN BOARD

Atari News

The word buzzing around the Atari community about the Falcon project is that everything is on schedule, if not running a little ahead of schedule. We've been able to confirm that selected US developers do have Falcons in their hands. So, things are looking up for the future!

DTP News

ISD Marketing has followed Soft-Logik Publishing's example, and is offering a trade-up offer to their Calamus 1.09N DTP package. For $95 (plus $5 shipping) and a photocopy of your current DTP program disk and registration card, you receive a registered version of Calamus and become eligible for future upgrades, including going to Calamus SL.

This offer is good until August 31, 1992. For more information, contact ISD Marketing, 2800 John St. Unit #10, Markham, Ontario, Canada L3R 0E2 or by calling (416) 479-1880.

MegaType Software has announced two new programs for the ST and TT: BitMaker v1.1 and MegaKern (and MegaKern Lite).

BitMaker allows users to convert fonts for PageStream into bitmapped versions to speed up screen redraws. Any version of PageStream screen fonts (.12H, etc) can be created from .DMF files, and for 2.x, screen fonts (.ABF) can be created from Adobe Type 1 .PFB files.

BitMaker also gives GDOS users access to all the fonts available for PageStream. BitMaker creates GDOS screen and printer fonts from PageStream .DMF printer fonts. According to MegaType, all bitmap font creation is done automatically with a few mouse clicks. No font creation knowledge is needed to create or use the rendered fonts.

Registered owners of the one or two module version BitMaker will automatically receive the updated version by mail. The price of BitMaker is $49.95.

MegaKern and MegaKern Lite allow PageStream owners to autokern both .DMF and Adobe Type 1 fonts. In a matter of less than five minutes (half that on a TT), you can have a precisely kerned font with more than 1200 kern pairs ready to use with PageStream.

MegaKern will even create kern pairs which make up for sloppy character widths within the font. The result is a perfectly kerned font, which is much more pleasing to the eye.

MegaKern kerns both Adobe Type 1 fonts and PageStream .DMF fonts. A special version that also kerns .ECF fonts for Font Designer will be available for registered owners of Font Designer or Font Designer Plus so both .DMF and Type 1/Type 3 fonts can be created from the same kern file. The price for MegaKern is $79.95.

MegaKern Lite, $49.95, kerns only PageStream .DMF fonts. This would be for UltraScript users who can't print Type 1 fonts from PageStream. For more information, contact MegaType at PO Box 645, South Bend, IN 46624 or phone (219) 288-7468

Computer Safari, a creator of unique and high-quality fonts for PageStream, is currently running a sale on their collections of fonts and clip art. Font disks that previously sold for $39.95 are now on sale for an incredible $6.88 a disk! Other collections are just $14.95. A collection of 250 Type 1 fonts is available on 14 disks for $119.95.

Computer Safari's collections of Star Trek PostScript clip art (over 100 images) and fonts (including title fonts from both The Next Generation and the original series as well as Klingon) are available for only $39.95 each. Also on sale is the Clipables collection of 600 EPS images for just $69.

For more information, or a copy of Computer Safari's sale catalog, contact them at 353 W. Main, Suite K, Woodland, CA 95695 or phone (800) 824-2547. Some quantites are limited!

Hardware News

Newell Industries recently announced an alternative to the TEC board from CodeHead Technologies. Newell Industries has produced an inexpensive hardware upgrade kit (TOS Adaptor Board or TAB for short) that allows users to install new TOS into an old ST—but, not without some hacking. The price is $29.95.

The TAB is a small circuit board that fits inside any ST, allowing the addition of any ROMS addressed in the E00000-EFFFFF range. TOS 2.06 is E00000-E3FFFF. Installation requires cutting 5-10 traces on the motherboard and possibly wiring up five jumpers, depending on your system. It is possible to leave the old ROMs installed with a switch to toggle back and forth between the two sets of TOS. For more information about the TAB and/or its installation, contact Newell Industries, PO Box 253, Wylie, TX 75098 or phone (214) 442-6612.

Gadgets by Small recently announced they have started shipping their long-awaited MegaTalk boards. The MegaTalk board connects into the Mega's expansion bus, and has two serial ports capable of up to 921,600 baud and a Mac SCSI port. The serial ports are both Atari and Mac compatible (for connecting to a LAN), and the SCSI port could be used to connect to a Mac CD-ROM or scanner, etc.

In a recent Gadgets by Small RoundTable Conference, George Richardson, of the Merlin Group, talked about the Chromax color board for Gadgets' SST. It seems a new graphics chip has come out that puts all of the power into one single chip, rather than spread over several as in the past. George indicated this would make the development of the Chromax a whole lot easier, and could make their color setup more affordable for the average ST owner.

He gave some specs for this particular graphics chip that sounded impressive.

With 16 colors, resolutions supported are:
800 x 600
1024 x 768
1280 x 1024

With 256 colors, the chip supports:
640 x 400
640 x 480
800 x 600
1024 x 768 (interlaced or non-interlaced)
1280 x 1024 (interlaced)

With 32,000/64,000 colors, the chip supports:
640 x 400
640 x 480
800 x 600

For comparison, the resolution for ST medium is 640 x 200, high res on the ST is 640 x 400, TT medium res is 640 x 480 and high res on the TT is 1280 x 960.

New Educational Software

D.A. Brumleve recently announced a new educational product for the ST—Multiplay! Multiplay helps children commit basic addition and multiplication problems to memory. Multiplay has three play screens: Pattern, Puzzle and Make Puzzle.

The program comes with an installation program allowing the parent or teacher to configure the disk to suit the skills of the child. Options that the child can see can be turned on and off using the installation program. The program is for children aged 5 to 11 and costs $40. For more information, contact D.A. Brumleve, PO Box 4195, Urbana, IL 61801 or phone (217) 337-1937.

Hybrid Arts Change

Barefoot Software, Inc. recently announced they now handle Hybrid Arts' MIDI product support and development. Products under development include SmpteTrack and EditTrack (platinum versions), and support of GenEdit v2.0 is now available. For more information, contact Barefoot Software, Inc., 19865 Covello St., Canoga Park, CA 91306 or phone (818) 727-7143, or type Go MIDIAVEN (MIDI A Vendor Forum) to get to Barefoot's online support area on CompuServe.

Lynx News

Atari recently announced a new ad campaign for the Lynx to coincide with the release of *Batman Returns*—including a new game by the same name! June 19th *Batman Returns* debutes both on the Lynx and in the theatres. TV ads will appear around June 15th, and a 32-page, full-color, glossy Lynx insert appears in with the latest Electonic Gaming Monthly magazine.

Two other titles, *Basketbrawl* and *Lynx Casino* are expected around the same time as *Batman Returns.* Also expected is the release of *Rampart*, a castle building/ battling game by Eric Ginner and Jerome Strach, who also did *Shanghai, Checkered Flag* and *Batman Returns.*

An announcement posted on CompuServe indicated that the Lynx version of *Eye of the Beholder* is *complete* and has been sent off for manufacture. That means it should hit the stores in late August instead of Christmas, as listed in Atari's CES press kit. *Eye of the Beholder* for the Lynx will be the first 512K (4 meg) Lynx game ever. It will also be the first to utilize battery back-up for game saves.

Another first for the Lynx comes from Telegames. Their game, *The Guardians: Storm Over Doria,* has been expanded and improved. Originally planned as a 256K (2 meg) game, Atari has decided to enhance the game significantly, bringing it up to 512K (4 megs) and using battery back-up. It will probably reach the stores in the fall. This will also be the first role playing game for any system that allows up to four people to play at the same time.

Show Announcement

Festival Atari de Montréal et Environs (FAME), organized by users' groups and dealers in the Montréal (Quebec, Canada) area, has been scheduled for September 26-27, 1992. Interested parties should contact either ASTMUM's Kest Carter-Morgan at (514) 272-6631 or MACAM's Terry Cowen at (514) 696-3773.

Right on Target

David Plotkin
Contributing Editor

A few issues ago, I remember reading an article from Dave Small graphically detailing some of the tribulations he went through to get the SST software going.

I have followed Dave over the years, as he has proceeded from one seemingly impossible project to another. Way, way back, he created the first Mac emulator, named "Magic Sac." This wonder allowed the Atari ST to imitate a Mac Plus.

I remember my first glimpse of Magic Sac. It was at an Atari show at the San Jose Convention Center many years ago. Dave was then working with a company called Data Pacific, and they had a booth to show off Magic Sac. I had heard rumors about the product, which Dave had been showing in various stages of completion at shows prior to the one in San Jose.

Previous to this, the product had been called MacCartridge (it was a cartridge that plugged into the cartridge port of the ST). I thought MacCartridge was a pretty good name—it seemed every other product for the Mac at that time had "Mac" in it somewhere.

Apparently, however, Apple didn't think it was a good name! They had been claiming for awhile that you couldn't use the phrase "Mac" in your product name without their permission. (I wonder what MacDonald's would have thought of that?) With literally hundreds of products for the Macintosh that had "Mac" in their name, this could have spelled big-time trouble for a lot of software vendors.

However, Apple chose, in most cases, not to enforce their God-given right (grin). In the case of MacCartridge, however, they decided they would not allow it.

Since Data Pacific didn't have the time or money to go up against Apple (who is not afraid to sue MicroSoft or Hewlett-Packard for using an idea they didn't even invent—the icon-driven desktop), they changed the name to Magic Sac—I guess because they were packaging and selling the product in brown paper bags!

Just as an aside, Data Pacific wasn't the first company to knuckle under to Apple. Digital Research, the inventors of the GEM desktop changed the design in later versions because Apple threatened to sue.

I am sure Apple would have *loved* to get Magic Sac off the market, for the simple reason that an Atari ST and a Magic Sac cost about half what a Macintosh did then. I even heard rumors of Apple personnel using Magic Sacs.

There wasn't much Apple could do, however. The Magic Sac needed the Mac ROMs to work, but Dave didn't supply the Mac ROMs with it. You had to go to a Mac dealer and buy the ROMs separately. These were easy to find in those days, in contrast to today. But the Mac ROMs were genuine Apple (in most cases—more on that in a moment), so Apple really couldn't do anything except tighten up the supply of Mac ROMs.

Apple managed to do this quite successfully by lowering the boom on dealers who sold the ROMs (most of which were obtained from Macs that came in for upgrades to the then new 128K ROMs).

What was interesting was that, for a time, even though Apple was tightly controlling the supply of ROMs, there seemed to be plenty of them around. Of course, it wasn't that hard to make your own copies of the Apple ROMs with a device called an EPROM burner (this is illegal by the way, just like copying software)—but these ROMs appeared to be genuine Apple, with the silkscreened logo and everything.

Apple investigated, with a little help

from the FBI (copyright violation, you know?), and eventually tracked down a gentleman in the Midwest who was making a handy profit making and selling "Apple" ROMs. When they arrested him, they found a house full of automatic weapons—he was expecting trouble, I guess.

At any rate, none of this had anything to do with Dave Small, who continued to refine the software driving the Magic Sac. He worked very hard at it, turning out many revisions that were made available to registered owners at a very reasonable upgrade price.

And, Dave struggled mightily to make the Mac software work with Magic Sac, learning more about the ST (and probably the Mac) in the process than he probably ever wanted to.

You see, it turns out to be *very* hard to make one computer imitate another exactly. Primarily, this is because Dave read all the programming guidelines Apple gave the developers for the Mac and believed those developers would follow those guidelines. If they had, Magic Sac probably would have worked flawlessly.

The problem was, many developers took liberties with the guidelines. The programs still worked on the Mac, but broke when you tried to run them on a Magic Sac-equipped ST. Even Apple broke its own rules.

Of course, this had dire consequences when Apple upgraded the Mac from the original 64K ROMs that Magic Sac used to the 128K ROMs in the newer monochrome Macs and the 256K ROMs in the color Macs. Apple also assumed the rules had been followed, and the programs that broke the rules stopped working on the newer Macs.

In fact, as the Mac software vendors scurried to fix their software to work on the newer Macs, many of these programs also began to work on the Magic Sac! Of course, software that was written to only work on the newer 128K ROM Macs didn't work on Magic Sac at all, and thereby hangs another tale in the saga of Dave Small.

But I guess that will have to wait 'til next month. See you then...

PREHISTORIK
RAIDER OF THE LOST BURGER

BRENDA MICKA
ACCT

It's time to get back to our roots, folks. Back to the time of dinosaurs, crude weapons and the never-ending fight for survival.

Computer games are so varied. You have everything from pure text adventures to graphics that make you sit back and say "WOW!" From simplistic solitaire card games to complex simulations. But, for me, there has always been a spot in my heart reserved for the ever popular platform games. Many hours have been spent sitting in front of the Nintendo with Mario and many dollars spent on Mario-type games.

Prehistorik did not disappoint me in this respect. It is a platform game with 150 scenes (I figure probably about eight levels) of club-bashing fun.

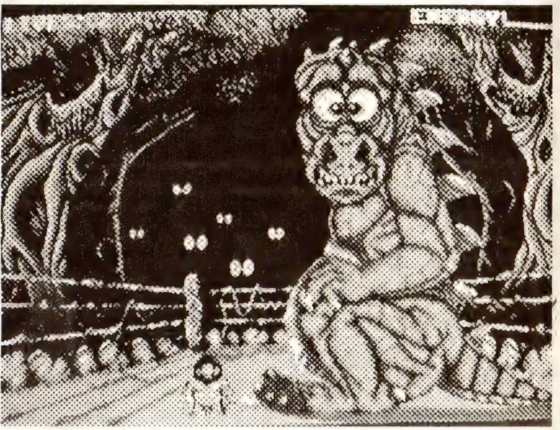
Level Determination

The documentation tells you there are 150 screens but not how many levels there are in the game. I tried to count screens while playing the first level and I think I came up with about 35 screens. Now, with this information, you might say there must be approximately four levels.

Except the 'big bad ugly' you have to meet "at the end of each level" is considered to be a level itself. When I killed the first "end of level monster" the game told me I had finished Level 2. Okay, so maybe there are four regular levels with these one-screen levels in between... maybe eight levels or so. I don't know, it's got me stumped....

The Why and How of Playing the Game

Prehistorik is the name of the character you play in this game. His main objectives are to gather as much food as possible and to live long enough to get it back to his people. His tribe, the Zoglors, ran out of food and water. So our hero (can't you see the light bulb over his head?) invented hunting.



At the top of the screen there are displays for score, food, lives, time and energy. There are a few points I need to make here. As far as score is concerned, I think it's an unnecessary part of the game. There is no high score screen to "compare" your personal score with and no reward for a high score (extra life, etc.). In addition, as soon as your last life is gone, the screen blanks and you can't see your score anyway.

The time limit to complete the levels is a good idea. Don't dawdle, your people are starving to death. The food bar indicates how much food you have picked up. If you reach the end of the level and don't have enough food, the game tells you that you have to go get more.

I may have been spoiled by the many other games I have played, but I think it should be possible, somehow (potions, eating some of the food you've collected, etc.), to get back some of the energy you lose along the way. As soon as your energy drops to zero, you lose a life. The documentation tells you there are many hidden lives around, but I have yet to find one. I have found them in the caves and gotten them from the Guru, but have not found a hidden one yet.

PREHISTORIK

Club Activities

You begin the game (and each subsequent life) with a club. Bashing enemies with the club stuns them long enough for you to walk over them and receive points. They then disappear. However, if you wait too long to stomp on a stunned monster, it will stand back up and come at you once again. This is indicated by a flashing arrow above the stunned monster's head. Some monsters take more than one hit to stun, while some others can't be killed or injured at all.

You will find most of the food you need in the caves, so you must go into them or you will get nowhere fast. In the caves, you will also come up against more monsters, fire, and various bonus objects.

Most of the caves are one entrance caves (you go out the same way you came in). However, some caves have what they call a "wrong-way" sign that allows you to walk out of the cave through the right side of the screen rather than the left. Doing this could be good or bad. It allows you to avoid the monsters you dodged on the way through. The catch is that it could exit you *anywhere* on the level, not necessarily adjacent to where you went in. When you use this option and come out of a cave entrance, you are momentarily invincible. This gives you a chance to react to the new surroundings, monsters, etc. Also, if you turn around and go back in the cave...it's not the cave you left! There may be food and bonus objects inside.

What Secret Rooms?

Secret rooms are also mentioned in the docs, but perhaps I haven't played through far enough yet. I haven't seen one, unless what they are referring to are the cave entrances you leave when you use the "wrong-way" exits.

Bonus Items

The bonuses that were mentioned are: Alarm (extra time), Bomb (stuns all enemies on that screen), Shield (temporary invulnerability), Axe (allows you to stun enemies with only one blow), Spring (improved jumps) and Cross of Life (extra life). These bonuses can either be picked up in the caves, or if you bash the Guru on the head with your club—he pops up in various places—he will leave one for you.

What?? No Pause?

One very large omission in this program is the lack of a pause feature. In a game that allows you to save your progress, a pause isn't a big deal. But you can't do that in this game (I can't think of a platform game where you can save). If you are happily playing and getting further in the game than you ever did before, and all of a sudden the doorbell rings...you're out of luck! While you are gone finding out that somebody got the wrong address, our buddy Prehistorik will more than likely perish at the "hands" of the Gubba-Glub, Pyro-Tax, Chimp-Agogo, Pteriyaki or some other stone-age type creature.

Conclusion

I have played through to about the eighth screen of the third level. Even though I estimate only eight levels, this game will take you awhile to complete. The graphics are good—Prehistorik's hair gets disheveled momentarily when he jumps and the once brown bears are blue in the ice world (presumably from the cold).

Overall, I like the game and would probably recommend it to anyone who is a fan of platform games. But, honestly, I wouldn't recommend it without mentioning what I consider the biggest problem...no pause feature.

SWAP

SWAP

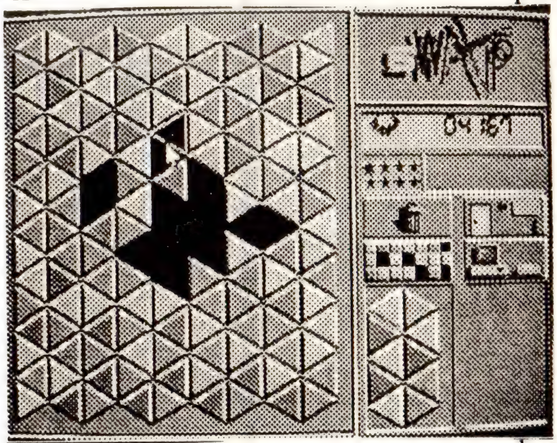
Kevin Slate
WMAUG

"Intelligence is something you demonstrated by buying SWAP, and something you will need when playing it."

The introduction to SWAP, a new game from Titus, makes this claim. The game, however, fails miserably trying to live up to its own intellectual claims. The idea behind SWAP is basically sound, but programming errors and lack of insight plague the game soon after booting.

The manual, which is translated into German, English and Italian, is a poor example of what a manual should be. The introduction is a witty description of what a "brain" is and proceeds to be a good "ice breaking" introduction.

Following the introduction is where the manual falls apart. The loading instructions tell you nothing of the status of the disk. Can it be backed up? Is it singled-sided or double-sided? Can it be copied to a hard drive? It simply tells you to insert the disk, turn your computer on, and keep the "SWAP" disk in your drive while playing the game because high scores are saved to it.



The game's playing instructions are simple enough to understand, but a few screen shots would be very helpful. The rest of the manual proceeds to tell you how to raise your I.Q. and offers a short five question I.Q. test...both of which are unnecessary.

Removing Tiles

The game is played by trying to eliminate "tiles" from a board consisting of multi-colored geometric shapes (always the same shape per level). To eliminate the tiles, you move the cursor to an area where two tiles meet and left click with the mouse. This causes the tiles to flip, exchanging positions. If, when flipped, the tiles abut a tile of the same color, they disappear.

This continues in an attempt to clear the board or acquire enough points to access the next level. Your point score is indicated by eight "stars" that are highlighted as you achieve greater point levels. You are also able to skip levels depending on how you do per level.

Options

A number of other options are also available (the actual options vary per level). A "Supplementary" feature allows you extra tiles to place on the board in an attempt to help eliminate others. Of course, each supplementary tile you use costs you some points—ten, to be exact. "Avalanche" allows all the tiles to fall to the bottom of the board but this one costs you one-hundred points.

"Credits", which are found in "harder levels," let you gain ingots and are used, or spent, when a flip results in no tiles being eliminated. Some levels also have a time limit. All the levels have an "Undo" feature, the ability to take back a move.

Prior to each level, an "introductory screen" tells you which options will be active for that level. Unfortunately, the manual does not describe how to interpret this screen. (The options that are not active could be "grayed out" a little more clearly.)

A practice level is also available, allowing you to configure any of the options.

Problems?

While playing SWAP, I ran into several problems and discovered a few options which I felt were necessary but not included.

To start with, the disk is not copy protected, but when using a standard disk copy, the game does not allow for more than two saves per disk. If you are trying to save more than two levels, an alert box pops up telling you "disk error," not "disk full." There were several other save errors as well.

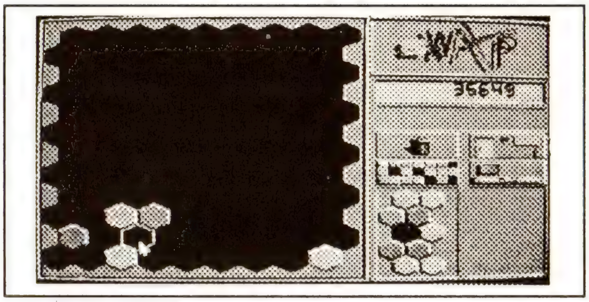
After failing to complete a level (e.g., timer running out, running out of ingots, etc.), there is no way to restart the level (short of using undo to get back to the beginning of the level).

If you save after failing a level and try to re-load, you are placed right back where you left off...failing the level. If the timer had run out, you are sent back to your saved level only to be switched to an options menu with no time to access the level. It would be nice if the program didn't allow you to save right after failing a level or running out of time.

In one instance, I ran out of time, saved the level, reloaded, and returned to the level to find the timer had turned off!

Another unimportant but peculiar error was the inability to type the letter 'G' when trying to save a level. It appears as a letter 'H'.

The "Undo" feature is also inaccurate. It not only allows you to take back one move, but you can also take back every move made to the beginning of a level. Doing so, however, tends to run into some problems. When you start to click on the tiles again, random tiles tend to disappear all over the board, following no particular pattern.



Summary

"Intelligence...something you'll need while playing" SWAP is an inaccurate statement that follows right along with the rest of the game's inconsistencies. In one instance, I was able to reach Level 60 by randomly clicking on tiles. There are 300 levels in all.

The basic idea behind SWAP is sound, but the game fails to perform up to my expectations. The manual is weak, and the gameplay is plagued with errors. It seems to me that SWAP's release was premature and I'd think twice before purchasing this one from Titus Software Corp.

COMPUTER BULLETIN BOARD 445-1313

WRITING A BULLETIN BOARD ON THE ATARI 8-BIT, PART 3

JAMES BASTABLE

BAPAUG

Hello again! In my last article, I explained how Turbo BASIC prevented the 850 Interface from being used because it destroyed the handler at load up.

The program in Figure 1 creates a file on Drive 1 called 850DRIVE.COM which can be BRUNed (BRUN "D:850DRIVE.COM") to load the 850 after Turbo has loaded. Thank you Arthur Edwards of Powys wherever you are these days.

Now, on to the nitty gritty of writing your own Bulletin Board. By now you should have a grasp of how to use XIO commands, so we'll go onto the problem of speeding up data transfer rate, which BASIC struggles with. The problem lies in the PUT and GET commands which, although being ideal for handling individual bytes to and from a device, are just too slow for speeds of 300 baud and above.

Actually, we need not worry too much about incoming data as callers to your Bulletin Board will be sending data at typing speed. This is well below 300 baud, as you can imagine. The GET command can handle this happily and still have time to echo the characters.

Program 1 to accompany Part 3

```
   Creates 850DRIVE.COM to load RS232 handler into Turbo Basic by
Arthur Edwards.
   1990 OPEN #1,8,0,"D:850DRIVE.COM"
   2000 FOR D=0 TO 87:READ BYTE:PUT #1,BYTE:NEXT D:CLOSE #1
   2010 DATA 255,255,0,56,75,56,169,80,141,0,3,169,1,141,1,3,169, 63,
     141,2,3
   2011 DATA 169,64,141,3,3,169,5,141,6,3,141,5,3,169,0,141,4,3,141,9,3
   2012 DATA 141,10,3,141,11,3,169,12,141,8,3,32,89,228,16,1,96,162,
     11,189,0
   2013 DATA 5,157,0,3,202,16,247,32,89,228,48,6,32,6,5,108,12,0,96,
     226,2
   2014 DATA 227,2,0,56
```

There's An Echo in Here

You must remember that any character sent to your Bulletin Board should be echoed two ways. Firstly, it has to be echoed to the caller which is standard Full Duplex operation. Secondly, it should be echoed to your own (local) screen so you may monitor what is taking place. This second operation can be ignored if speed is essential. So a typical GET operation should follow this format:

```
100 GET #1,CHAR :REM GET FROM MODEM ONE BYTE
110 PUT #1,CHAR :REM ECHO TO CALLER'S SCREEN
120 PRINT CHR$(CHAR); :REM ECHO TO LOCAL SCREEN
```

BASIC can output data easily in excess of 1200 baud by using the PRINT command. The problem lies in your own local screen display. If you were to PRINT out a string containing 1500 characters, you would either have to print it to your screen before or after displaying it to the caller. Either way, that causes a noticeable delay to the caller. Also, what would happen if the caller wanted to abort a stream of text being transmitted?

The answer is to break the string down into smaller parts, then PRINT them out to caller. After each PRINT command, the program could go away and check whether anything has been typed. It can also see if what has been typed indicates that the caller wishes to pause the listing or abort it completely.

During this interval, you could also check whether the caller is still on line by CLOSEing the port. Or, if using a Hayes modem set correctly, you could check for the character 3 (ASCII 51)—the Hayes code for 'No Carrier'—and then CLOSE the port to check whether the caller is actually still there or not.

I use the following subroutine to do print out text in chunks, but maybe you can think of a better one.

```
10 REM assuming that BUF$ holds data.
20 REM assuming that Channel 1 is open to
     RS232.
50 REM BAUD holds the value of the Baud Rate
60 REM using 0=300 Baud or 10=1200 baud.
70 M=BAUD+4
100 IF LEN(BUF$)<M THEN PRINT #1;BUF$:PRINT
     BUF$:RETURN
110 Z=INT(LEN(BUF$)/M):CNT=0
120 FOR LP=1 TO Z
130 T$=BUF$(CNT+1,CNT+M)
140 PRINT #1;T$;:PRINT T$;
150 CNT=CNT+M
160 REM Program goes away and checks for in-
     coming data.
170 NEXT LP
180 IF LEN(BUF$)-(Z*M)>0 THEN T$=BUF$((Z*M)
     +1,LEN(BUF$)) :PRINT #1;T$;:PRINT T$;
190 PRINT #1:PRINT
200 T$="":RETURN
```

Note that even though this is a subroutine, the line numbers are quite low. With standard Atari BASIC, routines that are the nearer the start of the program are accessed faster than those toward the end. This routine will PRINT larger chunks of data out at 1200 baud than it will at 300 baud.

On the Receiving End

Receiving data, as I mentioned before, is not that difficult, as it is usually typed to a Bulletin Board. With standard Atari BASIC, you cannot use the INPUT command. Although INPUT is fast enough, it will not stop trying to receive data until it gets an EOL (ATASCII 155) character.

This may not seem to be a problem at first, until you think about what happens if carrier is lost (the caller drops the line) halfway through receiving data the carrier was lost. Your program would sit there forever waiting for the ATASCII 155. And what about when you are transferring programs where the incoming data may not contain a 155 at all?

Binary GET

In most circumstances, you can simply use the GET command. But, when you want to receive data at high speed, you are going to need a more efficient command. Fortunately for users of BASIC XL, BASIC XE and Turbo BASIC, this command is readily available—Binary GET (BGET). If you are using Standard BASIC—nothing to be ashamed of—the program in Figure 2 contains a routine that loads a Machine Code program into a string called ML$ which duplicates the Binary GET found in other BASICs.

Program 2 for Part 3

```
   Creates M/C program for Binary Get by James
Bastable.
   10 DIM ML$(46)
   20 FOR LP=1 TO 46
   30 READ A
   40 ML$(LP,LP)=CHR$(A)
   50 NEXT LP
   100 DATA 32,68,218,104,104,104,10,10,10,10,
     170,169,7,157,66,3,104,157,69,3,104,157
   110 DATA 68,3,104,157,73,3,104,157,72,3,32,86,
     228,189,72,3,133,212,189,73,3,133,213,96
```

The Binary GET is used in this manner:

X=USR(ADR(ML$),CHAN,ADR(BUF$),AMOUNT)
where
ADR(ML$) is the address of the Machine Code routine
CHAN is the Channel Number being accessed
ADR(BUF$) is the address of the string into which you wish the data to be entered and
AMOUNT is the amount of Bytes you wish to be transferred.

As a bonus, the amount of bytes that was actually transferred by the routine is returned into X. Obviously, the Binary GET can be used with other devices, such as disk drives, for speedily reading in Data.

To ascertain how many bytes of data are needed to be transferred from the RS232 and entered into the USR parameter AMOUNT, you need to do the following:

When in Concurrent mode (XIO 40), issue a STATUS and PEEK memory location 747. This tells your program how many bytes are in the buffer. If there are no bytes in the buffer, then your program could go away and check whether the caller is still online. Otherwise, the value found in location 747 is placed into the variable AMOUNT.

Miscellany

As a recap, if you have set up Port 1 correctly using XIO 36, simply OPENing and CLOSEing the channel tells you if the caller is still there. If the caller has dropped carrier, this action causes a TRAPable error.

When receiving information on a Bulletin Board, always assume the caller is going to do something "stupid." For example, expect the caller to type in lowercase when uppercase is required. Your program should allow for this sort of thing and alter the data accordingly.

Also, try to remember that your caller may suffer line noise (data corruption due to a bad phone line connection), so check for characters that are never used in typed messages or commands and filter them out. To find these characters, look through a list of ASCII characters and codes.

In the next article, I discuss the Xmodem file transfer protocol, the simplest and most widely used form of transferring important data such as programs.

While Xmodem support is not essential to a Bulletin Board, it is most desirable.

Until then...

[redacted]

This is your invitation to the 1992 Connecticut AtariFest

Date August 15th & 16th
Time: 10:00AM-5:00PM
Place: Sheraton Hotel at Bradley International Airport, Hartford, CT
Price: $5.00 for a 1 day ticket
$8.00 for a 2 day ticket
Dinner & Dancing Saturday Evening

Anticipated attendees:

ABC Solutions
Atari Interface Magazine
Dr. T's Software
Gribnif Software
Joppa Software Development
Sam Ash Music
Tidbit Software
8-BIT Corner
A & D Software
Boston Computer Society
Derric Electronics
GFA Basic
Manny's Music
Step-Ahead Software
The Computer Zone
Users' groups
Atari Computer Corp.
Branch Always Software
GEnie Services
ICD Inc.
Maxwell CPU
Soft-Logik Publishing
Toad Computers
& more!

The Affiliated CT Atari Groups would be honored with your presence. For further information, call 203-332-1721 or 203-637-1034 and ask for Brian or Doug.

Programming in Michtron Command Language #3
A Tutorial for Michtron BBS 3.0 Sysops

Jeff Wells

Welcome Back! This is a tutorial for Sysops who run Michtron BBS v3.0 and would like to learn more about the language that drives the BBS, Michtron Command Language, or MCL. In our last article, we demonstrated some of the MCL commands through a program called MCL Baseball (MCLBBL).

There is one thing I hope you've discovered so far that is very important when writing a program in MCL, or any language. This is that there are some things you have to determine before you start coding your program. These include:

- What variables will be needed, Temporary and Global?
- What is the program to accomplish? What's the end result?
- Flowchart your program to determine what needs to be done and when.
- What input is required to make the program work?
- What is the output supposed to look like?

There are probably endless other questions we could add to that list, but, the key point I am trying to get across is that you should make a "map" of where you want the program to go. Programming without a concrete plan is like taking a trip without an atlas—you've got a good chance of getting lost. *Have a plan!* Having a well prepared plan can eliminate endless hours of asking yourself "Why isn't this program doing what I want it to do?"

In our last article, we discussed our plan, determined what variables were needed and assigned them. Then we started our program.

In the previous article, we created a menu and used the key_match(sexp) function to get input from the user. We also showed how to use the conditional IF statement to direct the flow of the program. Let's pick up right where we left off, just after testing if k == 'G'. The following code goes after that last bit of code from the last article.

```
print("PLAY BALL");
if(exist(z$))   /* Load Player */
{
      m = 1;
      open(z$);
```

In the above code, if the user entered a zero or a carriage return at the menu we previously built, the program would drop to the print("PLAY BALL"). Since all the other menu commands would jump to the MAIN label or execute a different MCL program module, there is no need to explicitly test if the user has entered a zero or carriage return. The only way the user could get to this point in the program is by entering one of those two choices.

The z$ variable was earlier assigned as the file holding the players' names. We did that in the last article as well, just prior to defining the MAIN label.

In the code above, we use another conditional if() statement along with the exist(sexp) function to determine if the file exists. If the file exists, the exist(sexp) function returns a -1, which is interpreted as TRUE. The function returns a zero (which means FALSE) if the file doesn't exist. The same result from the if() statement can be accomplished with the following code:

```
x = exist(z$);
if(x)
```

By using both if() and exist() together, we don't need to assign the result of the exist() function to a variable. When using an if() statement, it will only execute if the conditions are TRUE. *Note:* It should be pointed out that any non-zero condition (not just -1) is interpreted as TRUE. So, zero is FALSE; everything else is TRUE. Got it?

I can not stress enough the importance of checking for the existence of any file before attempting to opening that file. If you do not check and you attempt to open a file that is not there, the result will be a *fatal error* and the BBS will attempt to reload MAIN.MCL.

We then assign our player counter m to 1 (m = 1;) and open the file.

```
   while(1)
   {  x = read(y$);
      if(x < 0)
      {  gosub NEW_PLAYER;
         break;
      }
      if(logname(y$))
      {  o$ = "\\BBS\\BASEBALL\\BASEBALL.0";
         if(m < 10)
            strcat(o$,"0");
         str(w$,m);
         strcat(o$,w$);
         open(o$);
         read(a$);
         read(b$);
         read(c$);
         a = atoi(c$);
         read(c$);
         b = atoi(c$);
         read(c$);
         read(d$);
         read(e$);
         read(f$);
         read(g$);
         read(h$);
         read(i$);
         read(j$);
         read(k$);
         read(z$);
         d = atoi(z$);
         read(z$);
         h = atoi(z$);
         read(z$);
         i = atoi(z$);
         open("");
         break;
      }
      else
      {
         m += 1;
      }
   }  /* End of While
}
else
{
      m = 1;
      gosub NEW_PLAYER;
}
```

By using the while(1) statement, the program loops forever until you decide to break out of the loop. In this case, we do so by using the BREAK command. You may also assign or test a condition within the while() statement. For instance, while(m < 10) executes all code under this statement's domain until the counter m is less than 10.

The read(sexp) function retrieves data from the file we previously opened. The function reads until a new line is encountered in the file or 79 characters, whichever comes first. It is important to note that you must OPEN a file before attempting a read(), otherwise, it's FATAL ERROR time again. This function returns the length of the string read or -1 if there is no more data available.

There are three different ways you can use to call the read() function. These are:

read(sexp); This attempts to read data even if there is no more data to retrieve (i.e., you are at the end of the file). Attempting to read past an end of file causes a FATAL ERROR.

if(read(sexp) < 0); This checks to see if the End of File has been reached. If at end of file, it executes whatever commands fall into the if() statement's domain.

x = read(sexp); This assigns to x the length of the variable sexp or a -1 if the End of File has been reached. You can then test to see if you're out of data by looking at the contents of x.

I recommend using the second or third illustration if you are not 100 percent sure how many times you will be reading from a file. If you *know* there are only four pieces of data within the file, and this will never change, then the first example would be your best choice.

We use example three here, and then we check the condition of the read() function. If we are at end of file, then we jump to a routine called NEW_USER by using GOSUB. After that routine finishes (and we'll deal with what this routine does at a later time) and a RETURN is issued, the program returns to the next line after the GOSUB. This line contains a BREAK, which tells the program to stop executing the while(1) loop. Control is passed to the bottom of the loop, and the next line after the loop's end is executed.

If we weren't at the end of our players' file, the program moves on and checks if the user's name matches that of the player's name obtained by the read().

This is done by using the logname(sexp) function along with the if() statement. The logname(y$) function we used compares the contents of the string variable y$ to the current user's name (as contained in the system variable username$). If they are equal, logname() returns a non-zero (TRUE) response, which we test for with the if() statement.

If the user's name is stored in y$, then we know that our current user has played the game before and we need to load his/her data. First, we determine which file to load. To accomplish this, we use the strcat() procedure along with several if() statements to create a filename. In this case, some valid filenames might be BASEBALL.009, BASEBALL.015, etc. The number in the file extension is dependent upon the player counter m we've been using while reading from the players' file.

Once we have the proper filename, we open the file and begin to read. Notice, in this case, we use our first example of the read() statement. That's because we know for sure just how many times we have to read from that file.

During the read routines, we use the atoi(sexp) function. This function converts a 'sexp' to an 'exp'—a string into an integer. Simply stated, if s$ == "10" and we used x = atoi(s$), then x would equal 10. Since MCL can only read data into string variables, the atoi() function is used to convert that string data into integer form.

Once the player's data has been read, the program uses a BREAK to exit from the while() loop.

Finally, if the user's name did not equal that in the logname(y$) function call, we increment the player counter m by one and go through the loop again.

We continue to go through the loop until 1) we find an entry in the players' file that matches our current user's name, or 2) we get to the end of the players' file. If we find an entry, our user has played this game before and we load the proper data. If we hit end of file without finding a matching entry, our user has never played before, so the program jumps to the as-yet-undefined NEW_USER routine. Although we won't get to that routine in this article, you're probably already pretty sure what happens there—the user gets an entry in our players' file and we create his/her data file.

While we're on the subject of incrementing counters, there are two basic forms you can use. You can do either one of the following, with the second form being faster to type (less characters):

```
x = x + 1;
x += 1;
```

You can increment, decrement, multiply or divide (and even modus, And, Or and XOR) using the same format. Just change the arithmetic symbol. Whichever format you choose is fine—they both work exactly the same way.

Let the Game Begin

Now that we've gotten all the data set up for the current player—whether we loaded the data from an existing file or created it via the NEW_USER routine—it's time to start the game!

```
START_GAME:;
 print("\fWelcome, ",username$,".");
 if((a + b) >= 30)
   gosub reset_team;
 print("\n\nThe following has taken place
 since your last call:\n\n");
 z$ = "\\bbs\\baseball\\baseball.log";
 if(exist(z$))
 {open(z$);
  while(1)
  {x = read(w$);
   if(x < 0)
   {print("\n\nEnd of games recorded.");
    pause("\nPress any KEY to continue.");
    break;
   }
   read(x$);
   read(y$);
   w = atoi(w$);
   if( w >= i)
   {print("\n\n---------------------------
    -----------------------------------");
    print("\nTeam Name\t\t\t      1  2  3  4
    5      R  H");
    print("\n",x$);
    print("\n",y$);
    print("\n--------------------------------
    ------------------------------");
   }
   for(x = 1;x <= 200;++x)
   {
   }
  }
 }
 else
 {
   print("\n\nNothing NEW has happened!");
 }
```

We first clear the screen by using the print("\f...") command and print the user's name. Then, we check to see if the number of wins and losses, respectively contained in variables a and b, is greater than 30. We had to limit the number of games a user could play before resetting due to the way we keep the individual stats, which we will discuss later.

If the number of games played is greater than 30, we jump to the routine RESET_TEAM, which we also now need to write sometime in the future.

The program then checks to see if any games have been played by other users since the current user last played. Remember us talking about your MAP? Well, this is good example of how important such initial planning can be.

After each game is completed, we coded the program to embed the current_date() in the Game Log before writing each game's stats. Here, we can take advantage of that fact by checking the date our user last played against the dates stored in our Game Log.

If anything new has happened, we display the games. Then, we prompt the user to press any key to continue by using the pause(sexp) function. If no new games are found, we display a message stating so and continue onward...into our next installment!

Until next month, keep those keys a'clickin'.

B&C COMPUTERVISIONS

ATARI
800/XL/XE

APX CLASSICS NOW ON SALE!!!!

As low as.... **$4.00** **each with purchase of 10 or more titles**

$7.99 each if order is for less than 10 titles

These are the original classic programs that were created for the Atari Program Exchange (APX). All are new and come with complete documentaion. Supplies are very limited on some titles, so we suggest that when you order, you select a few "alternate" titles just incase some are out of stock. Some titles require public domain program PPD026 FIXXL to run on XL/XE computers. **SAVE $$$ by ordering 10 or more!!!**

Convector Professional

Bill Rayl

There's an old saying about a workman being only as good as his tools. Like most old sayings, there's a good deal of truth to that statement. Until recently, the toolbox has been pretty empty for the Atari desktop publisher. Even mediocre tools would have been a welcome change from no tools at all. Sure, we had a couple excellent DTP packages, but the Atari platform lacked the external add-on utilities necessary for a well-rounded DTP solution.

Take auto-tracing software, for instance. A year ago, there were no options available. Now, there are three packages with varying degrees of power—Silhouette, Convector Professional and Avant Vector.

While Silhouette is a full-blown graphics drawing program with auto-tracing features, the other two packages far outstrip its abilities to trace graphics. At the high end, Avant Vector has the most power and is a complete tracing and editing solution. At a retail price of $545, it's definitely not geared to the middle-to-low-end user.

Convector Professional, marketed in North America by Gribnif Software, happily fills in the middle ground. And, it does so without compromising in features or power. In fact, you get a great deal for the suggested retail price of $149.95. The software runs in all ST and TT resolutions (although in ST and TT low resolution, the drop down menus don't all display). At least one meg of memory is required.

What is Auto-Tracing?

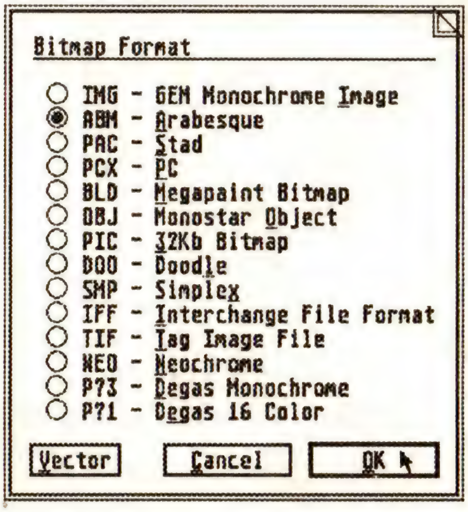
By now, most of you are probably familiar with the term auto-tracing and what auto-tracing software does. For those of you who are still in the dark, auto-tracing software "automatically" traces a bitmap graphic and creates a vectorized version of the image. *[Ed: For a more detailed description of rasters and vectors, see the "Rasters and Vectors" article, May '92 issue of Atari Interface.]*

Just how automatic the trace is depends on a number of factors—quality of the bitmapped image being traced, parameters set within the auto-tracing software, the type of tracing used and the abilities of the tracing software.

Comparisons

Fortunately, Convector Professional has the power to get the job done, and it does the job well. It even has a few options that can help improve the quality of the bitmap image with which you're working. Convector Pro compares very nicely to the auto-tracing features of Avant Vector and far surpasses even Adobe Streamline on the Macintosh.

There are actually two versions of Convector Pro contained on the distribution disk—the standard ST version and a TT-specific version. The TT version takes advantage of the TT's math coprocessor, Fast RAM and 32-bit ad-



Bitmap Format

○ IMG - GEM Monochrome Image

dressing. Gribnif claims the TT version is up to 11 times faster than Convector running on a 16MHz MegaSTE. Our tests verify this claim to be true! That's not to say the ST version of Convector Professional is slow, because it isn't. The TT version is FAST!

An added bonus is that either version can be run as a Desk Accessory, making Convector Pro available from within nearly any program. The program has special hooks allowing it to be used as a module within Arabesque Professional. Users of MegaPaint Professional can even use Convector Pro as a module!

While Convector may be everything you'll ever need for auto-tracing, you will need an additional program to edit/modify the vector graphics you create. That's because, unlike Avant Vector, Convector has next to no editing capabilities. Instead, Convector Pro focuses on doing only one job—auto-tracing graphics—and it does that job superbly.

You do have a lot of choices when it comes to an editing package, though. That's because Convector Pro supports nearly *every* bitmap and vector graphics format imaginable.

Bitmap Formats

Convector Professional can load any of the following bitmap formats: IMG, PCX, TIFF, IFF, Degas PI1 or PI3, Degas Elite PC1 or PC3, NeoChrome, Doodle, 32K raw PIC, STAD's PAC, Arabesque ABM, MegaPaint BLD and *more!*

Medium-Fine

○ Rough Calculations
○ Use Median Distance
● Optimally Fitting Curve

With IFF as the Amiga standard, TIFF as the scanning standard on Mac systems, PCX as the IBM bitmap of choice and IMG as the ST scanning standard (and the format used by Ventura Publisher on the IBM), Convector Professional can handle just about any graphic from the major computer platforms.

One thing needs to be noted here. Auto-tracing programs work best with images that are *only* black and white. Graphics using various grayscale shading or fill pattern effects are going to give any auto-tracer problems. If you have graphics with lots of fills or gray areas, it's usually best to edit those out before tracing.

Vector Formats

Once you've converted your graphic, Convector lets you save the vectorized file in GEM, GEM/3, Calamus CVG, MegaPaint VEK or VLB (Symbol), Arabesque AOB or Adobe Illustrator compatible EPS formats.

This wide-ranging support of file formats means you can use nearly any drawing/editing package on the market to modify the graphics. You can choose Calamus Outline Art, MegaPaint, Easy Draw, Gribnif's own Arabesque or even Adobe Illustrator (run under Mac emulation with Spectre GCR)—Convector Professional lets you use any (or all) of them!

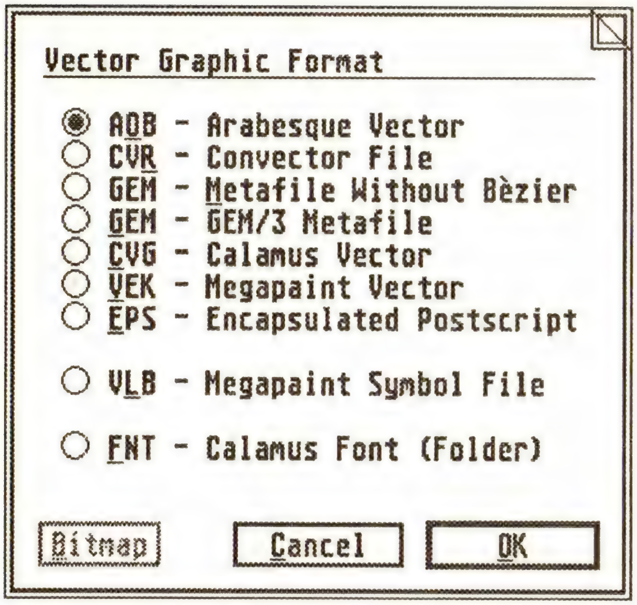
PageStream users can even opt to edit and colorize Convector's EPS output directly within the DTP program. All you need to do is first load the EPS graphic into a text editor (I personally use EdHak from Clear Thinking) and change the "%%Creator:" from "Convector" to "Adobe Illustrator." Then, you can Import the EPS into PageStream and edit to your heart's content.

I've tested the software using every one of the supported import and export formats mentioned above without a glitch. Unless I'm mistaken, Convector Professional supports more file formats than any other graphics package on the Atari ST/TT market!

Using Convector

One of the best things about Convector is that it's soooo easy to use. You'll be up and running in only a few minutes. By spending about 10 minutes reading the manual and playing with the options, you'll be an auto-tracing pro. Or, you can skip the manual, use the extensive online help and trim a few minutes off that estimate!

When you first load Convector, you're presented with Convector's desktop. Along the top, you have the



Vector Graphic Format

● AOB - Arabesque Vector
○ CVR - Convector File
○ GEM - Metafile Without Bèzier
○ GEM - GEM/3 Metafile
○ CVG - Calamus Vector
○ VEK - Megapaint Vector
○ EPS - Encapsulated Postscript

○ VLB - Megapaint Symbol File

○ FNT - Calamus Font (Folder)

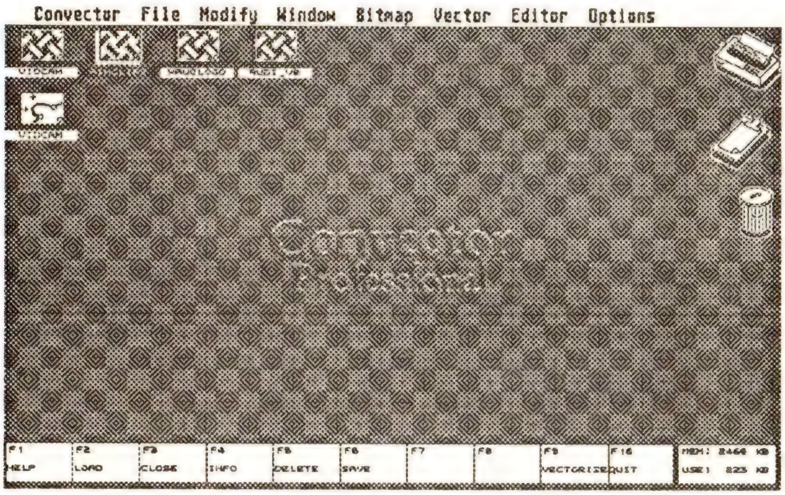
various drop down menus. A display of the various function key operations are shown at the bottom of the screen. On the desktop, you'll find a printer, clipboard and trashcan icon.

As you load bitmap graphics and create vector images, an icon for each of these is added to the desktop. Double clicking on one of these icons opens a window containing the selected graphic. If you have GDOS installed, you can print a vector graphic by dragging the icon to the printer icon. (*Note:* GDOS is not needed for any other program function, including saving of GEM objects. GDOS is *not* supplied with Convector Pro.)

What's Your Preference?

Before you start converting graphics, it's a good idea to set Convector Pro's Preferences to suit your needs. From the Preferences dialog box, you can tell Convector Pro to ask you for the file type to load or save, whether or not to open a window when a graphic is loaded, how to handle the UNDO function, and more.

Setting the Coarse Bézier Curves option speeds up screen redraws without affecting your actual output file. This is a handy option if you're using a normal 8MHz ST. The Bézier Quality setting also affects only the display of graphics on your screen, and lower quality settings can dramatically speed up display.



A VDI Béziers option is there to take advantage of possible future additions to the operating system in your computer. Atari has announced plans to add Bézier curve support to some future release of TOS. When they do, Convector Pro is ready to take advantage of that support!

After setting your desired Preferences, clicking the Save button will make Convector Professional use your defaults from then on. Clicking on the Help button gives you detailed help on all the Preference options available to you. (This online Help feature is available from every dialog box in the program.)

Bitmap Options

Once you've loaded in a bitmap image, you have only a few options available to you. You can Clip, Invert, Contour or Filter the image (or a selected block) or you can Vectorize the image. Other than the Vectorize selection, the Contour and Filter options are the most interesting.

Contour gives you the option of Outline or Inner contouring. As you might expect, Outline basically gives you an outline of the graphic, dropping out the black fills. Using Inner contouring allows lines to remain as lines.

Filter is a great option that can dramatically improve a bitmap image before Vectorizing. You can select Noise Filter, Contour Smoothing or both. The Noise Filter removes those nasty little dots and other imperfections that often appear in scanned images. Contour Smoothing helps soften "jaggies" in your graphic and is a great tool when enlarging a bitmap before vectorizing it.

Vectorizing

When it's time to convert your bitmap image to vectors, Convector Pro delivers a host of powerful options. I won't cover all of the available options here—the excellent manual and online help does a superb job of that.

Six Precision settings let you select how finely detailed the auto-tracing will be. The Coarse setting should be used for large, blocky bitmaps, while Fine is best suited to small images with lots of detail. For most graphics, something inbetween these extremes gives the best results. An Auto feature lets Convector Pro decide which Precision setting should be used.

Slider bars allow you to set the coarseness/fineness of the Bézier curves and polygons used in the tracing process. The settings you make here are directly connected to the Precision settings mentioned above.

If you are converting a graphic with little or no curved areas, you can opt not to use Bézier curves in the tracing. Only polygons and lines are used, and the trace is done much more quickly.

A dialog of Advanced Options allow very specific fine tuning of the tracing process. While you may never need to change any of these values, the ability to modify these settings is great for the more technically-oriented user. By experimenting with these settings, you can create more exact traces...or you can really screw things up! For most people, the default settings are probably best.

Vector to Bitmap

One unexpected feature of Convector Pro is its ability to convert a vector graphic back into a bitmap image. This gives you the ability to smooth out blocky bitmaps and resave them in IMG or MegaPaint formats. It also lets Convector Pro function as a good bitmap image convertor, converting TIFF, IFF and PCX formats into the more widely usable IMG format.

Font Creation

As if all this weren't enough, Convector Pro can be used to create vector objects that can be used in popular Calamus Font editors like Genus. While the process is a bit involved, it's not overly complicated. It's definitely much easier than creating a font from scratch!

Using this feature, you can scan in font output, convert the characters to individual vector objects, Index the characters and save them. Then, using a font editor, you can create a complete Calamus Font set from the indexed vector objects. Tools available from MegaType even allow you to create PageStream fonts from the new Calamus fonts. If you're into font creation, you'll definitely want to add Convector Pro to your software library!

Summary

As you can see, you get a lot for your money when you buy this package. Convector Professional gives you high-end power at a low-end price. No matter what desktop publishing package you use on *any* computer platform, Convector Pro is an ideal tool to add to your DTP environment.

If you happen to be a TT owner, the TT version of Convector Pro is simply a joy to use. In testing the software on an 8MHz STE, a 16MHz MegaSTE with math coprocessor and a 32MHz TT with math coprocessor and no Fast RAM, I was impressed with the performance on all the machines. But, the TT version is *much* faster than the others. Now all I need is some Fast RAM to really blaze along through those graphics!

I highly recommend Convector Professional. No matter what your DTP setup and regardless of what graphics editing programs you use, Convector Pro will fit right in.

Suzy B's Software

We want you to buy as few disks from us as possible!

Not Really! But why order a PD disk that isn't chock full of the programs and files YOU want? With Suzy B's Software you choose which programs are put on your disk, so that you only get the files YOU want and not those you don't need. We will send you our disk-based catalog (with detailed descriptions of 4,000 files, including file sizes). You decide exactly which files you want and place your order. All you need to do is make sure they will fit on a 720K disk. Most files are self-extracting archives, to get even more on each disk! Now we call that

"A Honey of a Deal!"

Single-sided disks are $5 and Double-sided are only $7 each. Shipping is free. And if you order four disks, your fifth is free! Where else can you get such "a honey of a deal"? Buzz through our nearly 500 page disk catalog. Only $1. Call today.

Cool Down This Summer

1 Mega STE's

• **Mega STE** 1MB RAM	$699
• **Mega STE** 2MB RAM	$749
• **Mega STE** 4MB RAM	$839
• **50MB** Hard Disk, Add Just	$250
• **68881** Coprocessor, Add	$99
• **2** Year Warranty, Add	$79

☛ There's still time to take advantage of our *MegaDeals*. With the purchase of any Mega STE, in any memory or hard disk configuration, you can get a color or monochrome monitor at a substantial discount. You'll get a complete Mega STE system, with hard drive and monitor for the price you probably paid for your 1040ST system! Consider it. To upgrade your existing ST, you might have to spend as much as $1500 to get comparable RAM upgrades, accelerators, new TOS versions, hard drives, and a detachable keyboard. For well under that price, you can get a brand new Mega STE, which includes all of those upgrades, not to mention the VME card slot (for expanded video) and Appletalk compatible network port. And it includes a monitor! Why don't you give your old ST to a friend or family member, or keep it as a spare. Remember, an upgraded ST is never as reliable as a new machine. Isn't it about time you stopped cramming things under the hood and thought about buying a new car? Now you can – *without feeling guilty!*

1.44MB Drive Included in Every Mega STE! *Free!* TT030's Now In Stock Too!

2 Monitors!

• **SC1435** 14" Color Stereo	$339

• **SC1224** 12" Color	$229
With Any Mega STE	***$159***
• **Magnavox 1CM135** 14" Color	$319
With Any Mega STE	***$259***
• **SC1224, SM147,** and Switch	$449
With Any Mega STE	***$309***
• **SC1435, SM147,** and Switch	$579

3 32MB FASTRAM

☛ Are you frustrated by the high prices, inflexibility, and low availability of Atari's TT RAM boards? Well now you don't have anything to complain about! Our new ***Toad-TT 32MB SIMM Board*** expands the bounds of the TT030 from 26 to 42MB! With eight one-megabyte SIMMS, you get eight megs of FastRam. With eight four-megabyte SIMMS, you get thirty-two megs of FastRam. And because you can upgrade in four-SIMM increments, you can start at four and stop at eight, sixteen, twenty and finally thirty-two megs! Buy this excellent board configured with our excellent RAM, or populate it yourself!

• **Toad-TT 32MB SIMM Board (Empty)**	**$399!**
• **One Megabyte SIMMS (Each, Installed)**	**$41!**
• **Four Megabyte SIMMS (Each, Installed)**	**$139!**

4 TOS Extension Card

☛ Give your ST or Mega a new lease on life! Give it the operating system upgrade that gives **you** the power of many software upgrades! This will bring you up to TOS 2.06! And this package from Codehead includes a disk with powerful utilities to make using TOS 2.06 even easier! Even comes with Atari's new XCONTROL (extensible control panel.) New features include:

- ***Placing Icons (Files, Folders, and Programs) on the Desktop***
- ***Assignment of Function Keys to Commonly Used Programs***
- ***Choose from Many User-Editable Icons for Devices and Files***
- ***Change Desktop and Window Patterns and Colors***

• **TOS Extension Card Standard Version**	**$129**
• **TOS Extension Card CPU Bridge Version**	**$139**
• **TOS Extension Card Bus Bridge Version**	**$139**
• ***NEWDESK Icon Editor CPX! (TOS 2.06 & Up)***	***$27!***

Adding a Hard Drive to Your Atari

Anton Malje
MACE

Floppy disks have their place, but most serious computer applications require a hard drive if the user's time is to be conserved. A hard drive is also known as a "fixed disk" because it is a sealed unit. Hard drives provide very fast access and large data storage capacity. For business applications, MIDI, video bulletin displays or for running a BBS, a large amount of data needs to be available online.

Setting up a hard drive on an ST or an XL/XE requires the same basic elements. The chief difference is in the choice of host adapter. In some cases, it is possible to house the drive internally (for instance, in a Mega ST or MegaSTE).

Host Adapter

Decide which host adapter you're going to buy first, as this choice may limit your hard drive options. The host adapter connects to your computer and provides a port to connect a SCSI (pronounced "scuzzy") hard drive (or drives) or SCSI controller. You can think of a host adapter as a bridge between your computer and the hard drive.

Host adapters often include other features such as other ports, configuration screens, machine language monitors or a real time clock. The importance of these extra features will largely determine your choice.

Just browsing through a couple issues of Atari Interface, I was able to find several different ST host adapters to choose from, with ICD's being the most popular. If you are an XL/XE user, there are at least three choices—the KP Interface (formerly made by Supra), the MIO by ICD and the Black Box from CSS.

All of these provide a port for a SCSI drive controller (most are also SASI compatible). SCSI stands for Small Computer Systems Interface, which is a standardized way of interconnecting devices.

Drive Types

There are several types of drives you will encounter if you look through computer advertisements. These include MFM, RLL, SCSI, SASI, EDSI, IDE, and "card drives." The last three types are, to my knowledge, not usable with any Atari currently on the market (there is a rumor that IDE drives will be usable in a yet-to-be-released machine).

MFM and RLL drives can be used if you also purchase the appropriate hard drive controller to control the drive via a SCSI (or SASI) interface. The best way to go, though, is to buy a SCSI drive to start with. These drives have a SCSI controller board built into the drive. That means there is one less cable in the hookup, no external controller to mount and no chance of RF interference (ingress or egress) between the controller and drive. And, you get a controller that is optimized for the drive.

Drive Capacity

Next, you need to decide how big a drive you really need, and then decide how much extra space you want. Consider the size of your collection of floppy disks. Multiply the number of disks times their capacity for an estimate of your current usage, and then consider your future demands. Although a 20 meg drive may be the cheapest, you may find a larger capacity drive is only ten or twenty dollars more.

In general, the bigger the drive, the more bytes of storage it gives you per dollar. I recommend pricing out the drive with this in mind: consider the total cost of the system (host adapter, case, cables, power supply) with different drives. For each configuration, calculate the bytes per dollar each would yield. Calculate for your RAMdisk and for the online capacity of your floppy drive if you want to put your hard drive investment in perspective.

3.5" vs. 5.25"

The two most popular physical sizes of the mechanisms are 3.5" and 5.25" drives, which refers to the diameter of the platter(s) sealed within the mechanism. These platters, and the bearings they spin on, operate at a high speed and must be manufactured with a great deal of precision. A skin of air is developed on the surface of the spinning platter, and the heads ride on this rather than making direct contact with the surface. A typical drive will have multiple heads and platters.

The 3.5" drives offer the advantage of being smaller, consuming less power, generating less heat, and they tend to be of newer design. Check into the features of the drives you consider. In general, all the 3.5" drives feature autoparking (the drive heads automatically park themselves in a safe place when you turn off the drive), but many older 5.25" drives lack this very important feature.

Access speed should also be considered. Newer designs have faster access times. Drives slower than 30 milliseconds should probably be avoided.

Buyer Beware

You will find some real "bargains" on used hard drives, but I do not recommend this route unless you know firsthand the drive in question has been used lightly and not abused. Many used drives are for sale because they were showing signs of their age. An old drive may have a lot of bad sectors, be slow to come up to speed, not boot when cold or be noisy. Also, if the used drive is MFM or RLL, there is the added cost of an external controller. Buying a used drive from a stranger at a swap meet is especially risky.

Removables

While most hard drives are sealed units, there are some that have the platters in a cartridge, and these cartridges can be removed and replaced by the user almost like a floppy disk. This may suit some applications well, but the units cost more, and the platter cartridges aren't cheap.

Removables are often used in conjunction with a large capacity fixed drive as a backup device, or in applications where a large base of data needs to be stored long term with infrequent need to access old data. Most host adapters can support more than one SCSI device, so it is no problem to have more than one drive online. Before purchasing the drive(s) and host adapter, double check on compatibility. Phone the host adapter manufacturer if in doubt.

Miscellaneous Items

Once the hard drive(s) and host adapter have been chosen, you still need a case, cables and a power supply. Electronics surplus stores and computer (or HAM) swaps can sometimes be excellent sources for these items.

If there is a good chance you will want to add a second drive in the future, you may want to get a case big enough now. A fan should be installed if the case lacks one. A thin foam filter is also a good idea.

Buying a used power supply should be done with care. It should be a high quality unit, and it should be less than ten years old. It should be tested with a voltmeter to insure the outputs are correct (+5v, +12v, -12v). If an oscilloscope is handy, the supply can be checked for hum or other problems.

SCSI devices are interconnected via a fifty conductor ribbon cable with socket connectors. Be sure pin one of each device connects to conductor one of the ribbon.

More Decisions

Once you have sorted out these details and determined what you want, you need to decide whether to purchase the whole package from a dealer or to piece it out. A dealer will usually format the drive for you, and some of them even pack the drive with Public Domain software.

If you decide to buy the setup piece by piece yourself, you will need to use a utility included with the host adapter to do a low level format of the drive.

Data is stored on sides of the drive's platters in concentric circular tracks called cylinders. You need to know your drives specifications, including the number of cylinders, heads, and bytes per sector in order to format the drive. ICD's formatting software for ST

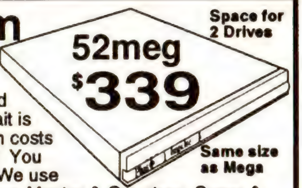
NO EXCUSES!

ST Hard Drive Case

$99

☑ Complete just add hard drive & host
☑ Deluxe Quantum/Plus Impulse Case
☑ with Supra SCSI Host installed S169
☑ With 20mb Hard Drive installed S279
☑ Drives from 20 to 1000meg available

Still running from Floppy Drives?



If your excuse for not purchasing a hard drive is the high $400+ price tag your wait is over. This complete ready to run system costs just a few bucks more than a bare drive! You won't have to give up quality or speed. We use top components such as Seagate, Conner, Maxtor & Quantum, Supra & ICD hosts. The deluxe 2 drive capacity under-monitor style case is built by Quantum, & is ready for use on the Atari ST/TT computer. (List price for case is over $250 without a drive!) Access times from 40ms to as fast as 4ms, warranties up to 5 years available. ***Limited Quantities !***

Drives below are "plug & go" - including drive & Supra host

hard drives automatically knows the configurations of many popular drive mechanisms.

After formatting, you need to configure the drive partitions, if you desire them. Partitioning allows you to divide up the drive to act like more than one drive. This can be useful in organizing your files, allowing you to subdivide things down further with subdirectories or folders.

Partitions also have another benefit. If a File Allocation Table (FAT) gets corrupted, only the data in that partition is affected.

If using an 8-bit Atari, you then have to do a high level format from DOS to each partition.

Care and Feeding

I will now briefly cover some of the care and feeding of your hard drive. Some things to avoid are vibration, heat, extreme humidity and fragmentation.

Fragmentation happens as files are deleted and new material is written into the gaps. Data files that get updated and expand with age end up getting distributed in many small pieces, a sector here, a sector there. With the normal additions, deletions and expansion of data files over time, fragmentation slows your drive and makes it work harder by having to hopscotch across the disk to read a file.

Fragmentation can be controlled via special software or by periodically moving one partition to another (empty) partition (and then, optionally, back to the original partition) via file copies. You can do this via batch files using wildcards or other tricks to make the task manageable. The ultimate way is to do a total backup of the hard drive, reformat the drive and then copy the data back onto it.

Failure?

A hard drive is built to be reliable, but it is possible to have one fail with little or no warning. Therefore, it is important to periodically backup the data.

This is where a removable hard drive makes a nice addition to a large fixed disk. Otherwise, you will likely have to backup to a pile of floppies. A double-sided 3.5" drive is recommended, and high density drives are great for this purpose. Atari 8-bit users would do well to obtain an XF-551 converted to 3.5" DS/DD, but that's another article perhaps.

Again, you can use special backup software to assist in the task, or you can rely on file copies. Usually, backup software does some compression of the data to shorten the task and number of disks used.

Never move the drive while it is running! If the drive needs to be moved, it should be "parked" before being powered down. This involves running a utility program if the drive does not autopark.

My Personal Needs

In my case, I needed a hard drive for an Atari 130XE that runs a BBS. The system needed at least 30 megs and had to be reliable enough to stand up to continuous duty.

Since my computer already had a half meg of internal RAM, I had little interest in buying the MIO. I prefer to have my RAM all within the XE, where a single +5v line is all I need to deal with for a battery backup.

I initially decided on the KP Interface, as it was the least expensive. But after much research, I found that most of the 3.5" SCSI drives wouldn't work with the KP Interface or the MIO. Also, The KP Interface has no configuration menus, because the configuration is burned on a ROM. This means you cannot simply add any hard drive to the system.

Only the CSS Black Box could handle 512-byte sectors and most newer drives were not switchable to 256-byte sectors required by the others. The Black Box also provides many features which, in retrospect, were well worth the price.

After several cost per dollar estimates, it turned out I could get a Seagate 157N 48.6 meg drive for only slightly more than a 30 meg drive, giving me more bytes per dollar.

When I called CSS to order my Black Box, they offered to try and meet the prices on the drive, cables, and supply. They also offered me several different used drives at attractive prices, but with my mistrust in used drives, I insisted on a new 3.5" SCSI drive.

I ended up buying a package deal with the advantage of having them test it all out. All I needed was to house the drive, which I hacked into a 1020 case, along with a tiny DC fan and an LED pilot wired into the +12v line.

As a SpartaDOS 3.2 user, I was limited to a maximum of 16 megabytes per partition. This means a minimum of three partitions were required to use the 48 meg drive. I chose to set up five partitions.

Conclusions

I have used the system for over two years now without hardware failure. A few partition FAT crashes have occurred along the way, however. One happened when a partition filled up and trashed the next partition due to an overlap in my configuration. Most of the other disasters have occurred by copying from a RAMdisk with a distorted FAT. I have battery backup for my RAM, so I can usually recover after a power outage, but this has resulted in havoc on a few occasions. And, of course, some of these events have caught me with with my backups out of date.

Sometimes, when I have to use floppies, I find myself wondering "what's wrong?" because I'm used to software coming up nearly instantly off my hard drive or RAMdisk.

Having the speed of a hard drive and the features of the CSS Black Box changes the nature of XL/XE computing radically. I can even find things now! It was a large investment and I was hesitant to make it, but I have never regretted it.

The main point to remember when deciding on a hard drive is to first educate yourself to the technical details and think over your requirements before making this purchase. An under-sized drive or a used drive that crashes full of your data is a heart and brain breaker! A hard drive should make things *easier* on you.

This is an important investment in terms of money and time, so it pays to be informed before purchase and set up.

AAAUA ATARI 8-BIT USER GROUP

Presidential Ponderings By Alvan Sherrill

Many of you probably have received literature from Jeff McWilliams who is proposing an Atari eight bit only magazine. (Also, see page 5 of the March 1992 AIM.) As noble as this effort is, I would like to see this energy go in another direction, namely increased support by AIM magazine. AIM is an excellent magazine which is currently supporting, at least nominally, all Atari computers. Jeff reminds us of the demise of A.N.A.L.O.G. and ANTIC and cites declining coverage by Current Notes, AIM and Atari Explorer magazines. Sadly, this is true. But the solution is not the elimination of coverage in AIM and launching yet another magazine on the uncertain waters of commercial publication; rather, let's concentrate our energies and resources with AIM. Let's examine some reasons.

First, up to 1/3 of the articles can be general in nature [i.e., topics that apply to both (all) machines. Topics like printers and drivers, telecommunucations, modems, monitors, ASCII/ATASCII code, binary code, radio packet transmission, etc.].

Second, advertisers will be reluctant to advertise in every magazine that treats only a specific computer, unless, of course, there is a huge user base. While there currently is a substanial Atari 8-bit user base, it is not overwhelming, nor is it likely to be in the future.

Third, many 8-bit users are also ST users or potential ST users. Conversely, many ST users also enjoy their Classic 8-bit. Also, if 8-bit users continue to get the short end of the stick and virtually be ignored by the Atari Corporation and many commercial sources, there is a very real possibility that many 8-bit users will conclude that they made a poor choice and decide to switch over to MSDOS. Of course, Atari IS a wise and viable choice for many users, but I can foresee disenchantment in major proportions.

I urge Unicorn Publications and Jeff McWilliams to work together to make AIM THE computer resource magazine. If it is decided to drop 8-bit support in AIM and launch a separate 8-bit magazine, I will support the effort. After all, it would be "the only game in town." But, I do not believe it can long survive as a separate publication.

ACCESS

Atari Computer Club
Encompassing Suburban Sacramento

ACCESS Officers ("*"=Director)

Name	*Number*	*Office(s)*
*Bob Drews	(916) 423-1573	President
*Ed Galvan	725-6955	Newsletter/VP
*Ken Helton	364-8224	Treasurer
Bob Haynes	371-1726	Archivist
Mark O'Connell	395-8137	SysOp/Membership
Barry Gordon	338-1488	Modem SIG
Tim Naber	452-2447	Disk SIG/Disk Library

As usual, please call any officer if you need information, directions, or even to make a suggestion. Or you can call the ACCESS BBS: (916) 428-8662.

For those of you who don't know who we are, ACCESS is the Atari Computer Club Encompassing Suburban Sacramento (California). We are proud to be an EXCLUSIVELY 8-BIT user group, carrying on the 400/800/XL/XE tradition. If you have trouble finding software for your 8-Bit, check out our Disk Library and the ACCESS BBS. We provide help and information to the local Atari community. In addition to AIM, our members receive "The ACCESS Key," our local newsletter.

We offer a number of meetings each month to give you more information on your computer and to answer your questions. And of course, we are anxious for you to share what YOU know, since there always seems to be something new and fascinating in the Atari world.

Our GENERAL MEETING is at 7:30 pm on the FIRST WEDNESDAY of each month in Classroom B of the S.M.U.D. training building at 1708 59th Street, between Folson Blvd and R Street, just off Highway 50. This is our main get-together.

Other monthly meetings are held on the following TUESDAY night at the home of Barry Gordon (Modem SIG), the SECOND THURSDAY AFTER THE GENERAL MEETING at the home of President Bob Drews (Board of Directors Meeting), and THE LAST SATURDAY OF THE MONTH at Tim Naber's house (Disk SIG). Telephone them for additional details. We hope you can be part of these groups.

Our meetings are very informal and lots of fun. The format is called RANDOM ACCESS, meaning it's up to you to bring something to share -- a new program you might be working on or an old favorite that you want to show off. There will be a sign-up sheet at the door.

We will start with a "question and answer" session, so be sure to write down specific questions or technical problems you might have. During this session we won't go into detailed answers, but we will point you to someone who is likely to know the answer, and then you can get together with him (usually Barry Gordon!) during the later part of the evening, after any demos or presentations, when all pretense of organization is dropped and we gravitate into informal groups and "catch as catch can."

We're comfortable with a "laid back" kind of club: casual, informal, just friends getting together on a monthly basis to share what we know or to learn from what somebody else is sharing. It's a great group. We have alot of fun at the meetings. If you are reading this and are not a member, come on and join us. We hope to be a group "where everybody knows your name."

Anyway, we hope to be in touch with you other 8-Bit user groups. Why not drop us a line -- electronically on the ACCESS BBS (916-428-8662) or "the old fashioned way" (at PO Box 1354, Sacramento, CA 95812-1354).

Miss an AIM Disk of the Month? Looking for a hard-to-find program? Let us help!
AIM has produced an ST disk since Jan. '90, an 8-bit Disk since April/May '91 and a Mac/Spectre disk since Oct. '91.

M.A.C.E.

The Michigan Atari Computer Enthusiasts

April Meeting

Our monthly meeting was held at the Southfield Civic Center and started at about 7:45. The School would have been closed at this time so the officers went back to the Civic Center. The meeting was held upstairs in one of the rooms that were partitioned into sections. Ray Simmonds and I were the first ones to setup, so we got the table in the front. Dave put his computer on the shelf over the radiator. We were all situated and ready to have fun for the next few hours.

Ted started the meeting by saying that all interested parties could come to the officers meeting held (usually) the first Saturday of the month at Mark Tappen's house. Then he got to the most important business, the new Amendments. The two Amendments that I detailed in last months Journal passed and are now part of the charter. The amendments were passed to give the Librarians more responsibility in setting prices for disks and more freedom in being competitive with other clubs selling similar disks.

Mike let people know a little about the mysterious Falcon. It's supposed to be the all purpose computer. It's suppose to have a processor slot for a 386 chip and a cartridge port for a spectre cart. Could have a graphics card that supports 16 million colors. Has an 030 processor that can run the majority of software avaible on a host of platforms. All this and cost very little. Mike Drysdale of Team Computers also commented about advertising saying that the dealers will still be doing the bulk of the work for Atari. He also remarked about the Lynx commercials and acknowledged that the ad's were stirring people to buy them in droves. On another question Mike responded with a comparision of the SST versus getting a Mega-E or TT. He seemed more inclined to get a Mega-E or TT. After that we started the demos.

I brought my printer to run the hardware and software that I had. I digitized part of a line drawing to show the clarity of features and the ability for contrast, and showed that same picture already done. Ray showed a digitized picture of the MACE logo which looked very colorful. I also had a shaded, colored picture of an eagle in front of a gem studded wall it to show the colors and sharpness of detail. Both of our programs work with hardware so there is no need for copy protection techniques. I don't think that the Easy Scan for the 8-bit is available anymore but, you might want to call Team Computers as they have been trading a lot of 8-bit stuff lately. Image Scan for the 16-bit is still available and probably the most inexpensive digitizer on the market. Someone asked if the software would do OCR (Optical Character Recognition), and the answer is no, because OCR is a different program. Mainly mated to hand scanners, the small hand sized scanners 'grab' the image and then the OCR software does its work. The Image Scan software only aids in the capture of an image.

The next demo was from the creator of EdHak. Craig Harvey wanted a text editor and then added the ability to read memory locations and disk sectors. He had the latest version of the program and the latest manual to go with it. With ease Craig edited disk sectors and memory locations, he explained and showed us the latest copy of the manual. All memory locations are discussed in the manual so you'll know what your looking at when you load it into EDHACK. The manual even has an index so you can look up information quickly. All the members enjoyed the demo and hope Craig will be back.

The Library demos were next, AIM disks and MACE disks for both the 16 and the 8-bit were reviewed. All in all I think the meeting went very well, the demos were well done, the guest was well known with a great program, and we gained a little knowledge from the meeting. We were also back at the Civic Center. The meeting came to a close at about 9:30.

May Meeting

May is originally the Birthday of MACE and this May meeting will celebrate that fact. May, a spring-time month, is a month in which life is born and it was the perfect time for The Michigan Atari Computer Enthusiasts to start a club. So it was, eight years ago that the owners of Atari Computers came together for the first time. Unlike a lot of computer systems, Atari has survived the years and is still here today. The main changes being new owners (for Atari), new computer lines and new users. Today Atari computers can serve as UNIX workstations or laptops that can last ten hours on AA batteries.

Along the same lines MACE has changed from being a club with only one computer line to devote time to, to a club that must support all the computers that Atari makes. This has the effect of spreading us out thin, we can't do five demos a night for the 8-bit computer line anymore. We still don't do any demos for the TT yet (Not many programs out exclusively for TT line). The needs of our membership have changed in the years since we started. So enjoy the party and remember that there are all kinds of Atari's out there, just like there are all kinds of people out there and we will support them all.

June Meeting

Our next meeting (June 23) will be about Telecommunications, a topic everyone can use. Terminal programs will be a subject as well as Bulletin Boards. Modems might come up as a topic since the new 9600 baud modems have come out. Hope to see you there next month.

Southland Computer Show

On Sunday, June 7, 1992 the officers will represent MACE and Atari at the Southland Computer Show. Several of the MACE officers will show the other computers what we are made of and maybe attract attention to Atari in general. Dosen't hurt to get a few new club members either. You can be there too, come and see the MACE display table or talk to the MACE officers. It will be open from 10:00am until 4:00pm, general admission is $4.00 dollars (less for children and persons over 65). Other computers will be there too, IBM's, clones, Mac's, and who knows maybe even a TT!

PACS Atari 8-bit SIG

PACS was represented at the Trenton Computer Show was really BIG. The weather was cold and it threatened to rain all day. Parking was remote and the free shuttle buses to the main campus were a welcome sight. Our president Bill Friedman was there manning the PACS table giving out information on PACS and the DataBus. Thanks Bill for doing your part to promote PACS.

The Atari was represented at the show by JACS the Jersey Atari Computer Society and The Lower Bucks Users Group (LUG) who had a lot of demos running on 8-bits and STs on the second floor of the student center. But much to the regret of some of my fellow Atari fans they had no software for sale at the show at the various vendors tables indoors.

At the Flea Market (outdoors of course) among the many booths there was quite a bit of ST software for sale as well as hardware. There were even vendors selling 8-bit machines andsoftware. The only drawback was the weather, otherwise it was a very enjoyable day. I enjoyed meeting the editor of Between Bytes Roger Heller (JACS) and mabey next year they will join NEAT as guests at our Computer Festival. I hope we will be able to get them to come next time as I am sure they will have a lot to show us for the Atari 8-bits as well as the STs.

The Meeting last month went well with our getting two new members for the 8 Bit Sig though some of our regulars were missing due to the holidays I guess. But the ones who were there were pleased with the SIG's acquisition of a printer now we can print DOCs at the meetings when we need them, demo word processing programs and print out program listings if needed. The SIG's 130XE is still not fixed though we hope to have it repaired soon.

The discussions at the PACS board meeting on the BBS was interesting but if they do go to higher baud modems those of us with 300/1200 baud modems may have some problems at log on. We might get some garbage chacters at first but we were assured that they will still support the lower baud rates. We will have to wait and see how things progress. At this time no changes have been made so you can log on as always and join the discussions on the Atari Sig area of the board.

ST and MIDI News

We are happy to let you know we will be able to give you more support now that some of the 8-bit members have gotten STs. Joseph Christie has gotten a MEGA4 STe with a 50 Meg HD and has said he is willing to be the NEW ST librarian so we will now be able to make copies of ST disks with out having our friends at NEAT help us. Thanks Joe I am sure that the ST members will be glad to help you build a new library with donations of Shareware and PDL disks. He also is interested our getting the AIM ST disks. He has a MIDI Demo Disk for his first offering from the ST library which will be available in Room M11B, it has 6 songs on it and seems like a good choice to start off with.

Jim Bruce has also gotten an ST and joined the ST part of the Atari Sig this month so lets welcome him to the group. We still don't have an ST at the meeting but hope to in the near future which should liven things up somewhat as a meeting without any Demos can get quite boring.

Joe and Jim have a lot of plans in the works for the ST members so be sure to get together with them at the meetings if you have any suggestions.

Joe also has a copy of the JACS ST Public Domain Library listing for you to look over. The disks can be ordered from JACS, PO Box 710 Clementon, NJ 08021. The cost is 1-10: $3.50 each plus $2.00 shipping and handling for each order (no limit); 11-20: $3.25; 21-30: $3.00; 31-40: $2.75; over 40: $2.50.

In line with the Baud rate discussion Joe has been checking out some of the local ST BBS's to see if they support the 300/1200 baud rates. He is especially interested since his modem is a 1200. So far he has discovered two local boards the ST EMPORIUM (215) 750-9065 and ST WORLD (215) 755-6743 who only support the new higher baud rates. He will keep on checking the BBS's out as time allows and report on it at our meetings and in the ST section of our Databus newsletter.

San Diego Atari Computer Enthusiasts

General meeetings are the 3rd Monday of each month at the North Park Recreation Center Social Room, 4044 Idaho Street, at 7 p.m. ST workshop/8-bit meetings are on the 1st Thursday of each month at the North Park Adult Center, 2719 Howard Street, at 7 PM. All meetings are open to the public. Annual SDACE subscription dues are $18, which includes increased BBS access, AIM subscription, SDACE quarterly newsletter and reduced rates on the disk-of-the-month.

SDACE, PO Box 900076, San Diego, CA 92190

President	Dan Phillips	(619) 462-1289
Vice President	Dean Smith	(619) 582-8157
Secretary	Jim Trageser	(619) 223-4608

SDACE Notes by Jim Trageser

San Diego Atari Computer Enthusiasts are busy planning for a LARGE Atari presence at the San Diego Computer Fair Sept. 18-20. We have been asked to display everything from Calamus SL to DynaCADD to Cubase to MidiMaze to an Atari-to-Amiga Falcon head- to-head competition (how many other computers can cross platforms in real time applications?). We also hope to display an STBook and a Portfolio.

SDACE members are serving as project managers for two areas of the computer fair, and we are one of the most active user groups involved. While organizers of the fair (San Diego ComputorEdge magazine and the San Diego Computer Society) are unfamiliar with the Atari's capabilities, they have been very impressed once exposed to the Atari, and very receptive to our participation.

We're also noticing a large level of interest among our non-Atari friends and neighbors regarding the rumors of the Falcon machine. Folks seem bored with the MS-DOS world, and are waiting for someone to introduce something radical and exciting. We're keeping our fingers crossed!

Any Southern California readers not involved with SDACE but interested in participating in the San Diego Computer Fair to show off the Atari's incredible power should contact us at 619/223-4608.

STUN

The ST Users Network (STUN) held their annual elections on May 20th.

President	Steve Cole	(801)521-8507
V. President	Eric Nikolaisen	(801)272-9203
Secceretary	Neal Baker	(801)967-7517
Librarian	James Hepworth	

STUN supports and maintains its own BBS called the BOLT, available 24 hours a day, 300-14,400bps. Running Ratsoft ST BBS software.

STUN meets the third Wednesday of each month. We meet at Murray High School (5400 South STate STreet), At 7:00pm.

WAUG!

WAUG General Meeting Minutes of 4-12-92

The Washtenaw Atari Users Group meets the second Tuesday of every month at the Student Union on the University of Michigan Campus beginning at 7:30 PM. Beginning in July of 1992 we will be meeting at the Colonial Lanes on South Industrial in Ann Arbor at the same time and day. We support all Atari computers including 8 bit, ST/STE/TT and Portfolio. A vast library of public domain and shareware programs is available as is help for both new and experienced users. WAUG is supported by MOlin's Den BBS at (313) 451-0524 and Clear Thinking BBS at (313) 971-6035. We can also be reached by phone c/o Craig Harvey at (313) 971-8576 or by addressing mail to 14 Payeur, Ann Arbor, MI 48108.

The May meeting was held at the Student Union as usual and opened at 7:30 PM. President Dave Brzezinski opened with announcements about the upcoming June elections and swap meet night. Dave mentioned that it would be nice if we could have some new blood joining the ranks of our leadership.

Also announced was the fact that we will begin meeting at the Colonial Lanes Bowling Alley beginning in July. Everyone seemed to be pleased with the facilities there (especially the parking) and we have just about worn out our welcome at the Union.

ST Librarian Mike Olin had so many new disks to present that he had to pass out a set of sheets to describe the offerings. 12 disks in all were presented for the membership including new disks full of utilities, STE demoes, GFA Draft and DBWriter on one disk, the AIM disk and a host of other programs.

8-bit librarian Dick Selke presented both the April AIM 8-bit disk with a new menu program and the May disk with some brand new demos from Germany.

Treasurer Russ Crum reported that we were still very healthy financially with over $1200.00 in the treasury.

Dave took the floor next to announce that we will be offering 720K disks to our members for 50 cents each as many or few as they need. He also took the opportunity to fill the members in on the progress of our proposed mall show. At the last officer meeting no progress had been made in getting any cooperation from any local malls, so it was decided to take a look at getting together with other local groups and some local Atari stores at a computer show in the area.

Dick presented his demo of Das Omen for the 8 bit. A very impressive program including sound and animation, it's on the May AIM 8 bit disk.

Mike showed off some of the STE demos from the new library disks. One particularly spectacular demo enabled you to scroll and rotate and move objects forward and back with the mouse.

Mike also did the demos for our featured subject, utilities. X Boot, Warp 9 and the fast file copier Cheetah were shown along with Divert which makes calls to any drive go to the drive you specify, and Sentry a hard disk optimizer program. Bill Rayl did a demo of the Codehead's Hotwire program that lets you configure a menu system and replacement desktop for your machine.

After our monthly drawing for door prizes the meeting was adjourned at 9:00PM.

Respectfully submitted,
Dan Cable Secretary

Wizard's Attic BBS	(716) 681-1654

The Western New York Atari Users' Group, based in Buffalo, NY, serves owners of Atari ES computers ("E"ight-bit chip, "S"ixteen-bit addressing...Atari 400, 800, XL, XE, and XEGS!). We meet on the first Thursday of each month at Bacon Hall, Rm. 116 East, Buffalo State College, 1300 Elmwood Avenue, Buffalo, NY.

WNYAUG members receive subscriptions to the POKEY Newsletter Disk and Atari Interface Magazine, discounted prices on disks from the WNYAUG Software Library, and access to the WNYAUG members Only section on the Wizard's Attic BBS.

All correspondence is encouraged. Our address is WNYAUG, PO Box 59, Buffalo, NY 14216

WNYAUG is a not-for-profit group which is not affiliated with Atari Corporation. We ARE a member of NorthEast Atari Regional User Support (NEAR-US), an organization of Atari user groups with the similar purposes of providing support for users of Atari computer equipment.

Meeting Minutes for April, 1992

The April, 1992 meeting of Western New York Atari Users' group was called to order by Mike Husband, President, at 7:41 PM. Sixteen persons were in attendance.

Mike began be delivering the keynote address to open the celebration of WNYAUG's Tenth Anniversary of service to the Atari community. Our group was originally formed (back then it was known as The North Buffalo Atari Users' Group), in April of 1982. Mike's address was short, but meaningful, and when it was finished, we tabled discussion of other business to make way for the planned festivities.

These began with the drawing for the door prize. Everyone who attended got a free ticket for this drawing, but Mike Husband was the winner of the Atari pin that was awarded.

Several other prizes were raffled off. Yours truly won an Atari lapel pin, Dave Shane won an Atari tie tack, David Soborowski (son of member Daniel Soborowski, whose wife attended along with their son David) won a game disk (sorry, I forgot the name of the program he won), Wayne Maracle won the Hackers' Grab Bag, and there were some other lucky winners who did not leave empty-handed.

Christine Hess then unveiled the homemade birthday cake she had baked for the group. The cake was made to look just like an Atari 800XL computer, complete with glowing red LED (the LED was a real 12-volt LED, and it was lit!), letters on the keyboard, etc. And to top it all off, it tasted great. She also made "real" potato chips (from FRESH potatoes, no preservatives or other junk added), which disappeared quickly into the gullets of the appreciative members. Fresh-brewed coffee and soft drinks were also served, and we got a chance to take time out from the monthly business and program demonstrations to mingle and visit with each other and just socialize with our fellow Atari users.

We did break down and demo one disk, though -- the monthly POKEY disks were on hand, and one was booted so that the members could take a look at the custom artwork Mike had created for the Koala display on the disk. The Energizer Bunny was a big hit, even moreso than the birthday cake depicting our WNYAUG name and the number "10" which preceded it. Once again, our esteemed President (and Chief Artist) outdid himself for the good of WNYAUG.

Upon his somewhat belated arrival, member John Chmielewski, SysOp of The New 8-Bit BBS, received a round of applause in recognition of his upgrading his board with BBS Express Pro! recently. Now if only Don K! would find time to get our Wizard's Attic BBS back in shape <grin!>.

The meeting (or party, such as it was) adjourned (disbanded?) at 10:00 PM, after Mike noted that the May meeting will feature the election of officers for the coming year. Plan on attending, lest you find yourself unexpectedly elected to an office!

WNYAUG Meeting Minutes May, 1992 Meeting

The May, 1992 meeting of Western NY Atari Users' Group was moved to Room 116 West, next door to our usual location in Bacon Hall, at the request of Buff State administration officials, to accomodate a meeting of the group "Young Black Minds."

A former WNYAUG member named Paul Torchia visited us for the first time in quite some time. Sadly, though, the purpose of his visit was to tell us that he was selling all his Atari ES equipment. Paul provided a lengthy list of all the stuff he has available, which is posted on The 8-Bit BBS.

I first met Paul a few years ago, it was from Paul that I purchased my first Atari storage device (an Atari 410 Cassette Program Recorder). I can attest that he has QUITE a collection of stuff, including the complete works of Shakespeare and Mark Twain (that's Antic and Analog, for those of you who are less familiar with my sarcastic tendencies), as well as some interesting hardware and software.

As of this writing, all Paul's stuff is available (best offer takes it). However, in light of what Paul learned at the meeting, pertaining to the Atari ES and hard drives, I still hope he'll change his mind!

Several disks were demonstrated, including the May POKEY, the copy of the SAGE N-O-D sent to us by Robert Buman of SAGE, and the demo disk from the Atari Expo 1991 (a great compendium of graphics and digitized sound).

Dave Shane reported that he and Don Koepf are looking into producing membership cards for the group. This is the result of our experience at the TAF Show this past April, where card-carrying user group members received a discount on the admission price. Hopefully, by the time we run into this situation again, WNYAUG will again be issuing membership cards...which, if all goes well, will also be able to double as name tags!

Dave also noted that WNYAUG again has blank formatted diskettes available for sale to members at the low price of just $4.00 per box of ten disks, including labels and write-protect tabs.

Finally, Dave volunteered to prepare the monthly Disk-Of-The-Month until our librarians return from their current series of vacation trips - and, WNYAUG wishes Norm and Betty Knab safe travel and much enjoyment on their journies this srping/summer!

Wayne Maracle Sr. reported that he has completed work on his database listing all articles from every issue of Analog Magazine. The database, which uses the public domain EasyFind program, has been donated to WNYAUG by Wayne and is an excellent reference guide for finding specific topics among the countless Analog articles that appeared in that magazine during its lifetime.

Watne also donated to WNYAUG, a copy of the Atari Converational Italian educational software, to be added to our software library. Thanks, Wayne!

John Kasupski again mentioned the need for WNYAUG to engage in some mass media advertising, perhaps in The Buffalo News or other local publications. John cited the sudden rash of information requests, BBS calls, etc. that occurred in the wake of our group's being mentioned in the Personal Computing column in The Buffalo News and noted that one woman who wrote for information indicated that she's been looking for an area user group for about six years!

Dave reported that the total gross proceeds from the Tenth Anniversary Party and April meeting was $107.00, including $60.00 from the auction that was held, with the balance coming from membership proceeds, disk sales, etc.

The group authorized the purchase of printer paper for use by the officers and POKEY staff.

Kevin Packard donated some diskettes to be used for an upcoming edition of the POKEY Newsletter Disk.

The 1992 Election of Officers was conducted, with the following slate of officers being elected:

President	Michael Husband (re-elected)
Vice President	John Kasupski
Secretary	Christine Hess
Treasurer	David Shane (re-elected)

The President confirmed the continuation of appointed positions to be held by those currently holding them:

Librarian	Betty Knab
SysOp	Don Koepf
At-Large	Bruce Andrew
Newsletter Editor	John Kasupski

Following the installation of officers, the meeting was adjourned. The next meeting will be held on Thursday, June 4, 1992 at the regular time and place.

Respectfully Submitted, John D. Kasupski

President's Notes by Mike Husband

The Western New York Atari User's Group Tenth Anniversary Party was a success. I wish to thank all the members who attended. A special thanks goes out to Lonnie Hudkins for his column "Personal Computers" which appears in the Buffalo News. On Sunday March 29, 1992, the WNYAUG appeared: In large bold type, "Atari Party", and the article then listed information about the WNYAUG. For reminding some of our old members that let their memberships run out, Lonnie Hudkins deserves credit for the good attendance and for telling Western New York that the WNYAUG is still going strong after ten years.

Credit for the membership increase is due to the work of John Kasupski and Christine Hess, who went through the old membership list and the phone book and tracked down some old members who had forgotten about the WNYAUG.

Apathy...I do not like to bring it up, so I will not. I will bring up something that I hope to see in the POKEY Newsletter. I would like to know WHY the members bought the Atari Computer??? I hope to see YOUR article Soon!!!

If you were in attendance at the WNYAUG Tenth Anniversary you saw and tasted Christine Hess's culinary delights. The Atari 800XL Cake with its red power light was delicious and the homemade potato chips were good too. I am still amazed that the pretzels were homemade! They tasted just like the name brands.

Elections will be held at the May 7, 1992 Meeting. More on this next month. I hope I will still be Dictator (OOPS, Freudian slip, I mean Democratically Elected President) of the WNYAUG! I have been hearing rumors of a Coup!!!

Tony Troidl, sysop of the Cat's Lair BBS, informed me Dave Arlington is head of the Parker Lewis Can't Lose Club! He is running it via a computer BBS. He appeared on *Parker Lewis Can't Lose* on May 3rd, 1992. Dave was in the *diner!*

President's Notes by Mike Husband

The May 7 turnout for the Western New York Atari User's Group was not very good. I do not believe we even had enough for a forum. The officers that showed up did decide to have the elections as previously planned. I am sad to see Kevin Packard leave us as Vice President. I wish to thank John Kasupski for volunteering to serve as Vice President and Christine Hess for volunteering to serve as Secretary.

The POKEY Newsletter Disk, I am happy to say, is seeing the country and maybe the world -- with just a little help from the WNYAUG. We send the POKEY to a few places, and it ends up in places we never sent it. This is good!!! I just wish I knew how the POKEY Newsletter Disk duplicates itself and sends itself to places that the WNYAUG does not send it to. I do not want to sound like an alarmist, but the only thing that I know that can duplicate itself and spread itself around is a Computer Virus!!!

I am pleased that John Kasupski enjoyed my rendering of the Energizer Bunny with a little extra WNYAUG Power!!! I have something on the palette now. I MUST admit that I find writing very difficult. Even this small article, I find very hard. As I stated before, I'm an artist, NOT a writer.

I do believe that any hope of new software and hardware for the Atari 8-Bits lies in Europe. It's all IBM & Mac's in the States. Eastern Europe is the place where the Atari 8-Bit still has the Power Without The Price. I believe WNYAUG should help them in any way that we can.

I hate to do it, but I am going to end this article on the down side. Seeing the turnout at the last WNYAUG meeting did not make me feel too good!!! In fact, as of late, I have been feeling a little burned out. I just hope this feeling goes away!!!

(Editor's Note: I spoke to Mike by phone as soon as I received this file to ask if there was anything I could do to help, and I'm glad to report that Mike assured me that his burned-out feeling has, indeed, gone away. So, this article ends on an upbeat note after all!)

When you're looking for late-breaking Atari news, honest product reviews and articles written by users just like yourself, look no further than *Atari Interface.*

Unique in the market, *Atari Interface* also serves as an official newsletter for 100+ user groups in the US, Canada and the UK!

Also, check out our ST/Mega, Mac/Spectre and Atari 8-bit Disks of the Month for the very best PD and Shareware software available each month!

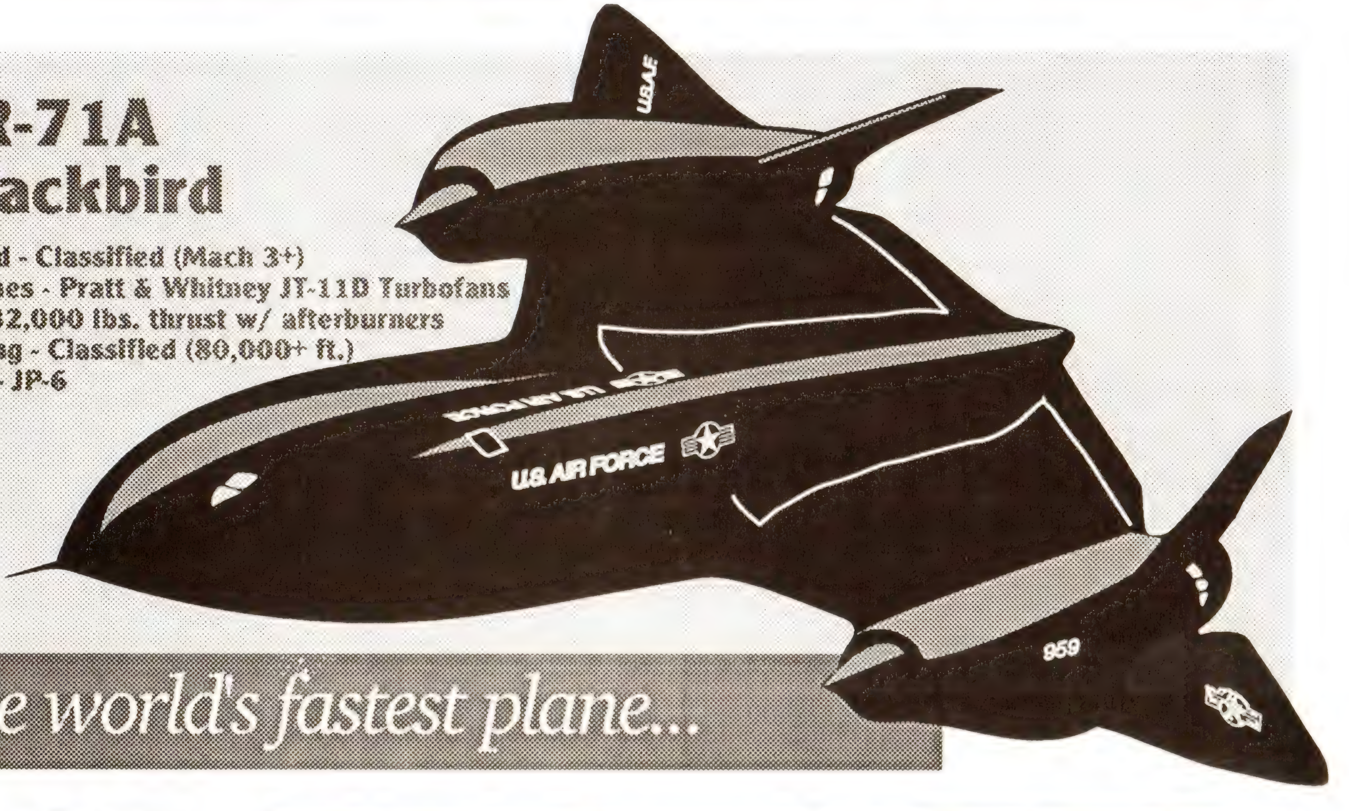
feel the need... THE NEED FOR SPEED

SR-71A Blackbird

Speed - Classified (Mach 3+)
Engines - Pratt & Whitney JT-11D Turbofans
32,000 lbs. thrust w/ afterburners
Ceiling - Classified (80,000+ ft.)
Fuel - JP-6



the world's fastest plane...

SST *...the world's fastest Atari*

Introducing the fastest, most compatible, most flexible accelerator available for the Atari Mega ST: the splendiferous totally cool ***68030 SST****. With its screamingly fast 68030 microprocessor, up to 8 meg of fastRAM (to 12 meg total), asynchronous design, and special compatibility software by Dave Small, the SST is any "ST pilot's" dream...*

...The dream can be ***yours****! So bring your Mega ST into the 90's, and turn it into one of the fastest machines on the planet!*

From the people who brought you Macintosh emulation on the Atari (and whose Dad actually flew the SR-71).

SST prices start at $599.00

68030 SST

Speed - 18 to 40 MHz asynchronous design; up to 12 times faster than a Mega ST
Engine - MC68030 Microprocessor with Caches and Burst Mode Afterburner
Ceiling - up to 12 Megabytes of RAM
Fuel - up to 8 Megabytes of 32 bit fastRAM in tandem with a 20 or 33 MHz oscillator
Operating System - TOS 2.06 (Mega ST^4), with the new Atari desktop
Expansion - processor direct slot; Chromax Super Video board already "in rollout"
User Upgradeable - when ever you want to

Atari High-Density Floppy Upgrade Installation Guide for MegaSTE and TT (What to do and what not to do!)

Gary Lentz
SWAG

On Saturday, May 23, 1992, I received the long awaited high-density floppy upgrade kit from Atari for my MegaSTE. Suggested retail price for the MegaSTE version is $139.95, while the TT kit is $10 more.

The kit includes an Epson SMD-340 high-density floppy drive, TOS 2.06 ROMs for the MegaSTE or TOS 3.06 for the TT and the new "AJAX" floppy controller chip. The Atari description is: "2MB FDD KIT (MEGA STE)" and the Part No. is CA401229-001. The TT version is Part No. CA401220-001.

These kits are intended to be dealer installed and no instructions come with them. Installation of the two kits is basically the same. While this article refers to my MegaSTE installation, I'll point out any TT-specific variations at the proper points in this article.

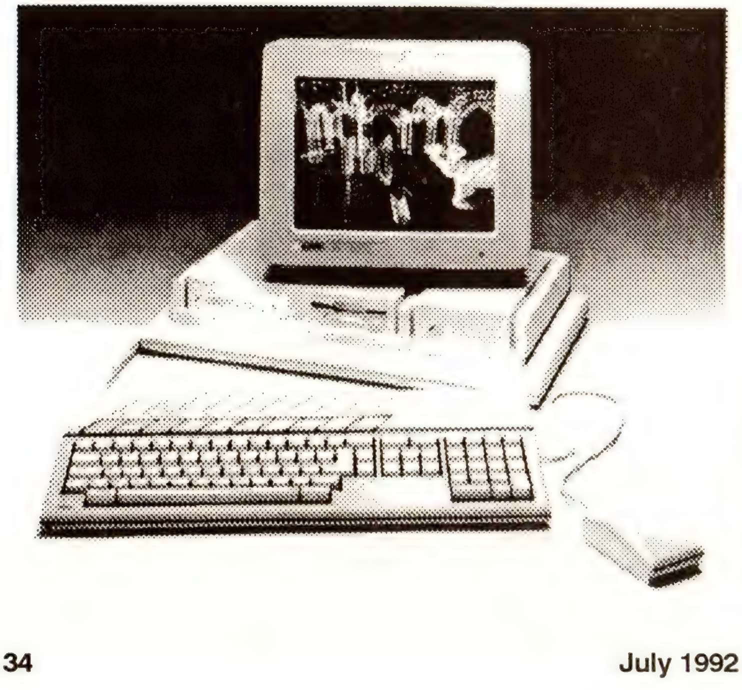
I installed the upgrade myself and I made one error which resulted in the crashing of my internal hard drive. Yes, the FAT got "fried, scrambled and otherwise messed up" and no recovery of the data was possible. Bummer! But thank the Saint of Computer Users that I had backups. I'll tell you how to avoid making the same mistake I did at the proper time, too.

Open 'er Up

Start by unplugging everything connected to the system. Then, remove the internal hard drive. On the bottom side of the computer the hard drive mounting screw is usually located under the Atari warranty warning sticker. It's the only screw that requires a standard screwdriver.

Loosen this screw until it hangs freely. Turn the computer right side up and you can now lift the hard drive out of the computer. Disconnect the power lead and the ribbon cable socket from the drive controller board (or from the drive on the TT). Set the hard drive assembly aside.

Turn the computer upside down again and remove all the case mounting screws (you'll need a Phillips screwdriver for this). Turn the computer rightside up again, and you can now lift off the top cover. The internal floppy drive is mounted to the top cover, but don't get excited about removing it yet. Just lean or prop up the cover with the floppy still attached.



Replacing TOS

The existing TOS ROMs are located in the lower right, just in front of the SIMM memory boards on the MegaSTE and the socketed RAM on the TT. If you have a TT with a plug-in ST RAM board, you will need to remove this board to get to the TOS ROMs.

Note the TOS ROM chip numbers (there are only two in the MegaSTE, four in the TT). The numbers on the MegaSTE end in 18 on the left and 19 on the right. The 2.06 ROM numbers also end in 18 and 19. On the TT, the TOS chips are in two rows of two, with the numbers ending with 25 through 28 (they are also labeled 00, E0, 0E and EE).

Remove the old ROMs (remembering which chips came from which sockets) and install the new ROM set, making sure the numbers correspond. Be careful! It is rather a tight fit for the backside pins, especially if you have four megs of memory installed in a MegaSTE. Also, make sure the notch on each ROM lines up with the notch for each socket.

Use a chip puller to remove the old ROMs, or gently pry them up from side to side using a small standard screwdriver.

Setting the DIP Switch

Just in front and to the right side of the TOS ROM sockets is a blue (or red on the TT) eight position DIP switch. Turn switch #7 On (push it up). Turning this switch on adds a "High Density" option to the Desktop's Format Floppy dialog box. If you fail to do this your new high density floppy will not format in high density.

If you're a TT owner, skip down to "Adding AJAX."

For MegaSTE owners, you now need to remove the hard drive controller board. That's the board the hard drive ribbon cable was plugged into. Remove the mounting screw in the lower left corner of the controller board and lift it straight up and out.

Adding AJAX

You should now find the WD1772 floppy drive controller chip. It's located above the RAM/SIMMs. Remove this chip and install the new AJAX controller chip. Make sure the chip notch is to the left (the same side as the notch on the socket). Again, a chip puller is best for this operation, but a thin screwdriver will work.

MegaSTE owners can now re-install the hard drive controller board. Make sure the socket on the bottom of the board is lined up with the pins sticking up from the motherboard. Press straight down and re-install the mounting screw.

TT owners can now re-install their ST RAM expansion board, if they have one.

On to the Drive!

Now it's time to replace the floppy drive. Remove the four screws that attach the floppy drive mounting plate onto the underside of the computer case cover. Then, remove the four screws that attach the mounting plate to the bottom of the floppy drive. Disconnect the floppy drive power lead socket from the back of the old floppy drive.

Important!! Take note: Look at how the ribbon cable and socket are attached to the old floppy drive. The socket *must* be turned over (upside down) when you plug it into the new high density drive.

Compare the back of the old drive with that of the new drive. Note the pin numbers on the new drive—Pin #1 is at the bottom left and Pin #33 is at the bottom right. The old drive you are removing most likely will be an Epson SMD-380. The pin-out on that drive is reversed—Pin #34 is at the bottom left and Pin #2 is at the bottom right. *Failure to reverse (turn over) the ribbon cable socket can result in trashing your hard drive's FAT!*

Finishing Touches

Now that you have properly plugged the ribbon cable onto the new high density floppy, you can put everything back together. When attaching the mounting plate to the bottom of the new floppy, make sure the plate is properly positioned. An instructional message is engraved in the mounting plate.

After you have replaced all the case mounting screws on the bottom, you can re-install the internal hard drive. For the TT, this simply requires properly reconnecting the power and ribbon cables.

On the MegaSTE, make sure the controller board socket is seated tightly on the pins. Press down on the right side to check seating. Push the ribbon cable socket onto the pins sticking up from the top of the controller board. *Careful now!* It's rather a tight fit for fat hands, and it is easy to bend one or more of the pins. Re-attach the hard drive power lead.

Replace the hard drive assembly by holding it in place, turning the computer over and tightening the hard drive mounting screw on the bottom.

Now you can plug everything back in and fire it up. You will need high density diskettes—the ones with the extra hole on the right side—to be able to format in high density. You should find High Density listed in the Desktop's Format dialog, or you can use a disk format program that supports high density formatting.

Why My Hard Drive Crashed

I was in a hurry and wanted to get my new "toy" up and running. I didn't compare the floppy drive ribbon cable pinouts. I simply attached the floppy ribbon cable socket in the same position on the new floppy drive as it was on the old one.

When I got everything back together and turned the computer on, both the internal and the external floppy drive lights came on and stayed on. I should have stopped right there and turned the computer off.

But, I didn't do that. Instead, I tried to access the internal hard drive, which was set to autoboot. When I did that, the lights on the two external hard drives *and* my SyQuest drive came on and stayed on! I tried a couple warm re-boots and a couple cold re-boots before I shut everything off. *Error!* Big time error!

I started over and opened the computer, checking the proper seating of the newly installed chips. When I got around to the floppy drive and compared the cable pinout, I found my error. I turned the cable socket over and put everything back together. When I fired the system up, everything worked like it should. Everything, that is, except the internal hard drive, which I had to reformat, repartition and use my backups to put it back like it was.

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required.

$ 39 95

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945.

$ 14 50 ea.

XL/XE SUPPLY

Power Pak for 800XL,600XL 130XE, 65XE & XE Game.

$ 25 00

KEYBOARDS

New and complete subassembly. Easy internal replacement.

130XE/65XE	$35.00
800	$40.00
800XL	$29.50

XL 40 PIN LSI CHIP SET

A Complete set of 40 Pin Large Scale Integrated Circuits for your 800XL, 600XL or 1200XL computer.

Great for quick repairs! Set contains one each of the following: CPU, GTIA, ANTIC, PIA AND POKEY.

$ 14 95

800 5 PIECE BOARD SET

Includes Main Board, Power Board CPU, 10K O.S. and 16K RAM Board. All boards new, tested and fully populated. Set includes instructions that will allow you to repair ANY 800 Computer $28.50

1050 REPAIRS

We are now offering a limited repair service on the Atari 1050 Disk Drive. Please call our Service Dept. at 510-352-3787 for a Repair Authorization Number. Units without RA# will not be accepted. Service rate . . $69.95

Down to BASICs

Sloopy Malibu

BASIC! The word causes fright and fear in the hearts of some computer users. In some others, it sparks interest. On the Atari 8-bit computers, this language is one of the most widely used. It is one of the most stable and one of the best languages available for the Atari.

In this series, I plan on showing you how to program in BASIC at an intermediate level—what to look out for and how to do things properly. As for the subject material, I am going to use BASIC to do things you would normally want or need to do in real world programming.

I am starting this month by giving you a list of materials required for any BASIC programmer, and a list of optional but highly recommended tools. In the next column, I will cover programming the game controllers (joysticks, paddles, Atari Pad, etc.). After that, I will delve into the character set.

From then on, it will be pretty much whatever you and I decide. If you have a specific topic you'd like covered, send your ideas to the magazine c/o Down to BASICs or leave me (Sloopy Malibu) Email on the AIM BBS at (313) 973-9137.

The Bare Necessities

Here are the things required for any BASIC programmer:

An Atari 8-bit computer with 16K+ of RAM.

A BASIC Cartridge if using a 400/800 or XL. The XLs have a nasty bug in their internal BASIC, so that is why I say you need a BASIC cartridge for them.

Some storage medium, usually a disk drive, hard drive or cassette. Although this isn't truly "required," there may be a few programs you'll write that need a place to put data to be read in and such. And storing your programs on a disk or tape is a whole lot more convenient than retyping them in every time you want to use them!

A working knowledge of how to type in programs into your computer and, if you have a storage medium, how to load and save them.

Recommendations

On to the highly recommended list. This is a list of references that, although not needed, are helpful. Without these resources, you will not be able to go much further in each topic I'll cover in these articles.

The *User's Manual* for your machine (the BASIC Manual in the case of the 400/ 800). This is a good reference for all the BASIC commands.

Mapping The Atari by Ian Chadwick. This book is just a memory map of the Atari 8-bit computer, but it has usage examples.

Programmer's Reference Guide for the ATARI 400/800 Computers. This book goes further into commands than I will in these articles. It is a good BASIC reference manual. (If you have this, you don't need the *User's Manual* mentioned above.)

Inside Atari BASIC. A decent book on the individual commands available.

These books are available (as of this writing) from American Techna-Vision (see their ad in this issue). I have exclusively used them for four years now without a problem. Well, they do have this problem of saying things I order will be delivered in two weeks, but they shows up in only one. Who am I to complain? (grin)

An alternate source for *Mapping the Atari* is me. I have a few copies and will sell them for $15 each.

Now we are off to the good stuff...here is a list of basic BASIC commands you need to know, as well as how/why they are used. Don't worry; they are not complex.

DOS REM LET END
RUN STOP LOAD SAVE

These are simple commands. Although they may need initial explanation for beginners, they do not require indepth discussion. Here is a quick run down of them. If you need more details, refer to the *Programmer's Reference Guide* mentioned earlier.

DOS—Usage: 'DOS'
Takes you to your DOS menu.

REM—Usage: '20 REM this is a remark'
Puts REMarks (comments) in your programs, at the line number specified.

LET—Usage: '30 LET X=100'
Signifies that a variable is being assigned a value. Although redundant, it is in the language. Its main purpose is for readability.

END—Usage: '999 END'
Signifies the end of a program. It isn't really needed at the end of a program unless you have subroutines following the program's ending point.

RUN—Usage: 'RUN' or 'RUN "D:filename.ext"'
Executes the current program

in memory or loads and executes the said file from the disk drive.

STOP—Usage: '40 STOP'

Halts program execution at the current line number (used mainly for debugging purposes).

LOAD—Usage: 'LOAD"D:filename.ext"'

Loads the named file from the drive into memory.

SAVE—Usage: 'SAVE"D:filename.ext"'

Saves the current program in memory onto the drive.

Final Suggestion

As for the DOS you use, that's your choice. I use both MyDOS and SpartaDOS. The amount of RAM you have isn't any problem either. Almost all the programs we'll be writing in this series will run on a 16K machine with DOS loaded. The only exception I can think of right now is when I do a segment on expanded RAM.

That's it for this month.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

SHIPPING And HANDLING is always just $3 in North America and $5 Internationally, regardless of quantity of *KE-SOFT* products ordered. NO State Sales Tax is due.

All Advertised ATARI Software Products are Distributed in North America and the Western Hemisphere by:

AUTHORWARE

These programs are offered from Authors who have worked long and hard to produce programs that have a narrow audience, but nontheless, are needed by some users.

"Bowling Handicapper" by Rick Haines
Use for entire league. Many variables. Handicaps automatically figured. Mono or color, **$15** +$2 P&H

"Golf Handicapper" by H.E. Taylor
Use for entire golf membership. USGA rules. Use course rating. NOW SHIPPING Mono or color.**$15** + $2 P&H

"Comic Book Collector" by Al Baggetta
Comic Book Database. Has several tutorials, sample files. Mono or Color . .**$15** + $2 P&H

"Splitter" By Travis Guy
Mini-Backup program for users who want a simple program to back up 1 partition or folder and set of files. Good GEM interface, easy to use. Easy program to save and restore files. Split files too large for single disk. Program is intuitive, lets you know how many formatted disks needed, rings bell when next disk needed, etc. Format backup disks without leaving program. Color or Mono, **$15** + $2 P&H.

All programs are sold with a 30 day money back guarantee

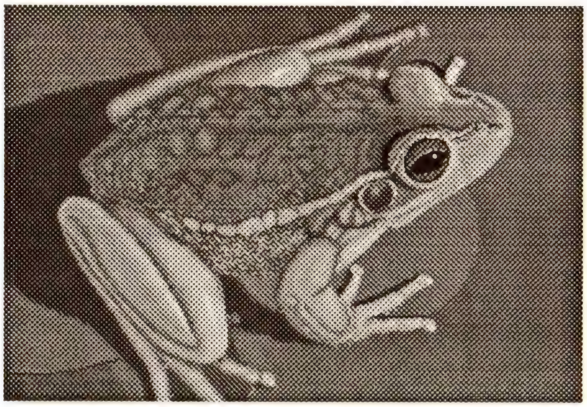
Drag



Ed Hall (AAAUA)

Drag is a clone of BoulderDash, one of the best games ever written for Atari 8-bits. The original was released by First Star Software and became popular enough to generate a sequel, BoulderDash II.

Later, Electronic Arts repackaged both under the name Super BoulderDash. There was also BoulderDash Construction Kit from Epyx, and an English variant by Mastertronic called Rockford. And, if you couldn't afford the commercial products, there were PD versions of both the game and the editor.

Imitating a classic may seem like a formula for success, but it is actually a risky proposition. First of all, there is the danger that the original may have lost its appeal. If it hasn't, the way is still not clear, for the clone obviously cannot be a carbon-copy. It must be similar enough to cash in on the original's appeal, yet different enough to induce people to shell out for it. Finally, a clone always invites comparison with the original.

Comparing Boulders and Frogs

Drag is a multi-level digging game whose protagonist, Drag the frog, excavates gems. Obstacles consist of impenetrable walls, stationary mines and two kinds of falling objects—boulders and bombs. But, where BoulderDash was primarily an arcade game with strategic elements, Drag is almost entirely a puzzler. There are 4 reasons for this:

1. Instead of a time limit, Drag has a "move" limit. (This, in turn, has generated a new game element: oxygen canisters, which reset the move counter.)

2. There are no pursuing insects—in fact, there are no organic enemies of any kind.

3. Where BoulderDash utilizes four screens to make up one level, Drag uses only one. This gives Drag a more compact look and feel.

4. The "physics" are slightly different. In Drag, objects do not fall as soon as they are excavated; there is a delay of several moves before they drop. During that extended "hang time," falls can be triggered with a press of the joystick button.

The overall effect of these differences makes Drag a more thoughtful game than its progenitor. Each screen is like a chess problem, and many are devilishly constructed, requiring lots of careful study and experimentation. You'll have to plan each move carefully, then execute perfectly.

Finally, a word about graphics. BoulderDash was a success not only because of its compulsive gameplay, but also its wonderful graphics. Even today, those graphics remain as fresh and attractive as when the game first appeared.

Happily, Drag's graphics do not suffer in comparison; they are simply gorgeous. However, Drag himself is not as cute as the impatient, toe-tapping Rockford.

Now Dig This

BoulderDash and BoulderDash II each came with 16 "caves" to explore. Drag has 50 levels plus an editor—an exceptional value at the asking price of $10.50.

I love game editors—designing your own screens can be as much fun as playing them. Drag's editor is a self-booting program on the back of the game disk, where there is plenty of room to store your own creations. It's so simple to use that a single paragraph of instructions covers all its features.

For those suffering from terminal frustration, the editor also offers a handy way to cheat. This means Drag will never be one of those games whose higher levels cannot be glimpsed without investing months of play in reaching them. I like that.

Drag is another product from the prolific KE-Soft. It's a professionally programmed piece of software that's fun to play, and whose game editor and large number of pre-rolled screens offer unlimited playability.

Shipping and handling is an additional $3 (regardless of quantity ordered). Software Infinity also has a 24-hour telephone order line (814) 238-7967. VISA and MasterCard are accepted.

A-T-A-R-I

Answers, Tips And Relevant Information

Paul Alhart (AFED)

Usable USR Routines

Just the other day I overheard a computer technician say "There ought to be a law against anything written in BASIC." When I asked him why, he replied "Because it's a stupid language."

I let the subject drop there, but it did get me to thinking. I have heard and read many comments like this about BASIC over the years. Mostly they are made by *non*-programmers or programmers who are snobs. The truth of the matter is that BASIC is probably the most widely used high level programming language there is for any personal computer platform.

BASIC is a powerful yet easy to learn language. It allows you to write programs quickly without having to worry about the little details involved with I/O, memory management and messy things like that. On the other hand, compared to most compiled languages, BASIC is very slow.

There are lots of tricks that can be used to speed up BASIC programs, though. One of them is the use of machine language from within a BASIC program. In Atari BASIC, this is done by using the USR command. Although the routines themselves are written in machine language, the bulk of the program can be written in good old BASIC.

The machine language routines must be in your computer's memory and the program must be able to locate them. There are several ways to do this. The code could be in the form of data statements which are read by the program and POKEd into specific memory locations or into a string. This takes time though, and generally accounts for the message *Initializing...Please Wait,* that you see at the beginning of some programs.

Another way is to write the code in the form of string data to begin with. Although this requires the programmer to type in lots of those funny looking characters, there is no initialization delay when the program is run. Also, for this method to work, the code must be relocatable.

OK, so we have gotten a little off the subject of simple BASIC programing. Rather than chance losing any of you by delving into an in-depth study of machine language and Atari BASIC, I'll just jump right ahead to the fun part, the Usable USR Routines.

On this month's AIM 8-bit DOM you will find several canned USR routines I have collected over the years. They can be used in your own programs to add speed and features that are not directly supported by Atari BASIC.

There are two LISTed files (USR.LST and PICTURE.LST) and a 62-sector picture file (PICTURE) which is used to demonstrate PICTURE.LST. Use Bob Puff's UnArc utility to extract them from the file USR.ARC.

USR.LST contains the following routines:

Double PEEK—This routine gets a 16-bit decimal address and places that address in the variable "I". You supply only the first location of the address. For example, If you specify 560 the results would = (I=PEEK (560) + 256*PEEK(561).

Double POKE—This one also requires the location of the first address to POKE to. All other entries will be considered 16-bit or two byte numbers (0-65536) to POKE to successive memory locations. For example, X=USR (DPOKE,960,100,4000,3) places the following values in memory: 960(100), 961 (0), 962(160), 962(15), 963 (3), 964(0)

Single POKE—Works the same as above, but only POKEs 8-bit numbers (0-255 decimal). Great for setting color registers or placing data in successive memory location like Page 6.

RAINBOW—Cycles the color register of your choice for four to five seconds before returning it to its previous value. As written, it will cycle the background color (color register 4). To rotate a different register, change the 12th machine language character in the routine (the character just before the first inverse "P") as follows: ^V (Control V) = register 0, ^W = register 1, ^X = register 2, ^Y = register 3 and ^Z = register 4.

Clear Memory—Clears blocks of memory by writing zeros to all locations specified. You supply the starting address and number of bytes to be cleared. Be careful! This routine can also erase portions of memory vital to the O/S, causing your computer to crash if you supply the wrong address.

Clear 256 Bytes—Works the same as Clear Memory except that you supply only the starting address. Then, 256 bytes (or one Page) of memory is cleared starting at that location. This is useful for clearing Page 6 or for clearing memory to be used for player/missile graphics.

P/M Move—This one is actually two routines, one for moving a player Up the screen, the other for moving Down. You must supply the base address of the player you wish to move.

Memory Shift—Moves a block of memory to a new location. It's useful for swapping character sets. You supply the From address, the To address and the number of bytes to be moved.

CIO—Quickly copies large blocks of data between memory and other I/O devices using IOCB#2. It's great for moving a disk-based data file into memory, as you will see in the program PICTURE.LST.

To use CIO, IOCB#2 must first be opened for the desired operation. In PICTURE.LST it is opened in LINE 35 to READ from D:PICTURE. Changing the 4 to an 8 in the OPEN statement opens IOCB#2 to WRITE to D:PICTURE.

Next, you must supply three arguments to the USR call. The 7 tells CIO to read from the I/O device and write to memory. A 9 here reverses the process as long as the IOCB was opened using an 8 for write. The next argument is the first address in memory you wish to read from or write to. The last argument is the number of bytes to read or write.

PICTURE.LST is a short BASIC program that makes use of some of these routines. Besides being a useful subroutine, it should help you understand the usage and power of USR routines. It gets a 62-sector (MicroIllustrator) picture file from a disk file and display it on your screen.

PICTURE.LST first uses DPEEK to find the display list and the beginning of screen RAM. It then sets up a graphics 7+ display list (Lines 27-33). On XL/XE machines, this is the same as a GR.15 call from BASIC. There is no BASIC equivalent command on the 400/800, however. Use of this method of setting up the display list will work on any 8-bit Atari. Change GRAPHICS 8+16 in Line 27 to GRAPHICS 8 if you would like to have a text window at the bottom of the screen.

Line 34 uses SPOKE to set all the color registers to the desired values. This line is not required if you want to settle for just the default colors.

Line 35 opens IOCB#2 to read from "D:PICTURE".

Line 36 tells CIO to read 7680 bytes of data from D:PICTURE and put in in memory. In this case, it puts it directly in screen RAM so you can see it. Next, RAINBOW is invoked for a little special effect.

You need 7680 bytes of data for a full GR. 7+ screen. Change this value to 6400 if you are going to use the split screen text window. By changing the 4 in the OPEN statement to an 8 and the 7 in the CIO call to a 9, any picture being displayed would be saved to a 62-sector disk file. Line 37 is used to hold the picture on the screen till the BREAK key is pressed.

Yes, that's me in that TV test pattern. Makes it all worth while doesn't it? 'Til next month....

Celebrate Montreal's 350th Anniversary!

Festival Atari de Montréal et Environs

September 19-20, 1992

Sat. & Sun., 10 A.M. to 5 P.M.

at the Monkland Centre, in N.D.G.
4410 West Hill Avenue
Montreal, Quebec, Canada

Door Prizes, Product Demos, Music, DTP and Full, 8/16/32-Bit Coverage!
ADMISSION: $4.00/day. Children, under age 12, admitted free.

FAME is a joint effort of 3 Montreal-area users' groups:

ASTMUM • MACAM • MAST

For Exhibitor/Visitor Info-Kits, write:

FAME '92 INFO
c/o K. Carter-Morgan
P. O. Box 966, Stn. B
Montreal, PQ Canada
H3B 3K5

Voice Lines:
Kest (514) 272-6631
Terry (514) 696-3773

Taxis must enter West Hill from Monkland Ave.

MUC Transit directions are: Obtain a free, bus transfer, from machine, in the Metro station, at origin of trip. From Villa-Maria Metro, take the #162 bus west, to Madison, and walk (continue west), 1 block, to West Hill. Turn right and walk to back of circle for entrance. You've made it!

Hotels and other accomodations are conveniently close to our festival. Please join us. ♿

THE GOOFY GURU

Another SIO Cable Modification

Charles Kelley (SNACC)

It may have come about when you found you had both a printer interface and an SX212 to support. It may have come about when you found that the XF551 or the US Doubler did not like your setup as well as the ads said they would.

What you need is the latest Goofy Guru project—the Four Headed Hydra cable.

Other similar projects have appeared, no doubt, but...well, decide for yourself.

Building the Cable

Start by going to a discount hardware, auto supply or department store and buying a disposable knife. This is the type where, if the blade goes dull, you snap off the dull end. Mine cost 99 cents at a local K-Mart store.

Take two standard Atari SIO (peripheral) cables and mark a point on both about 2/3 of the way down the cable. You are now going to remove the outer black layer of both cables. To do this, expose about 1/8-inch of the blade and mark matching 3-inch sections of each cable. Cut all around the cable at the top and bottom of these sections. Make your cuts by rotating the cable under the knife at the top and bottom edges of the section you wish to expose.

You next peel off the foil layer to expose a maze of color coded wires. Warm up a soldering iron. For this project, you may wish to not only use a low wattage soldering iron, but you may want to use a very cheap one. You must use the iron to strip the wire properly, and you will gunk up the point. Heat stripping the wires will make or break your final cable. No other stripping method is recommended.

Strip a section of the most alike wires you are able to match up. Watch out for wires that appear to have the same color but actually have an added black stripe with the main color.

Lay the exposed ends together, crossing each other, and twist. You start by having the loop of one wire laying on top of the other. Twist where they overlap. You should end up with a ring laying between two twists of wire, where one twist joins exposed sections of wire and one joins sections of wire that are still insulated.

Next, find the proper pin for the color of wires joined and test for continuity between the matching connectors. *Then, and only then, solder the joint at the twisted section where the wires are stripped. Leave the twist that remains insulated alone.*

Now, take electrical tape and wrap each of the joints. The double twist in the wire should be left. The resulting joint has never been cut and should be much stronger than that made with similar modifications. You also have a better cable electrically.

The next step is equally important. After you have completed, tested and soldered all of the proper wires, you are going to wrap the cables together with electrical tape. (Trust me. The details on why you need the double twist and the wrapping are very, very important and very, very boring).

The strongest way to do this is to begin on one cable. Wrap that cable leg, continue to wrap over the splices in the middle, and then wrap around the same cable leg past the splices. Then, snip the tape and begin wrapping the other cable leg. This wrapping will result in a much stronger cable.

The first advantage to doing this project is that your computer signals have to travel over a smaller distance. The second advantage is that you have more ports open for devices that only have one cable. This project produces cables that are stronger, and they should have less electrical problems over other modifications, too. A lot of similar projects just forgot some basic cable splicing techniques.

Who knows, less cables may even cause your computer widow to smile again?

The Goofy Guru series originated in the pages of the Southern Nevada Atari Computer Club and continues to irritate all. Everybody else asks for donations these days (I break things too), so I live at 125 N. 1st Ave. W., Duluth MN 55802 and, well, I prefer short redheaded women most of all...

Odds and Ends

Ellen Lentz (ACCT)

Joseph Hicswa, 8-bit VP of the Jersey Atari Computer Group (JACG), is looking for a Pinochle game for the 8-bit. If any of you out there know of one, he would appreciate hearing from you at 23 Passaic Ave. C3, Passaic, NJ 07055.

John H. Dean, 16-bit VP of the JACG, sent me a Pinochle game for the ST. If any of you program both for the 8-bit and ST, and would be willing to translate it to the 8-bit, I would be more than happy to send it on to you.

Ideas for Clubs

Joseph also informs me he and other club members check want ads for Atari systems being sold. Sellers are contacted, told about the club support, and copies of the club newsletter are sent to them. Some continued with their Atari, while others share the newsletters with whoever buys the system. They've acquired some new members through this process.

JACG is also planning to mail a newsletter and flyer to state-wide high school and college computer classes informing Atari owning students about their club and support. These ideas might be something other clubs could consider to increase their membership.

The Atari Computer Club of Toledo, Ohio (ACCT) is planning to show their support for the Classic 8-bit by making donations from the Club Treasury to several Shareware authors. The Atari community depends on these authors to help *Keep Atari Alive,* and this is a gesture to show our appreciation.

Visualizer Support

Those of you who have the program VISUALIZER—a great, easy-to-use program which came out in the early 1980s for creating titles for VCR tapes—might be interested to know there is a program available (PS2VIS.BAS) from the Ol' Hackers Club to translate Print Shop Icons to the Visualizer format. You use a joystick to position the icon anywhere on the Visualizer screen. It is available for $2.50 from:

Ol' Hackers AUG, Inc.
c/o Alex Pignato
3376 Ocean Harbor Dr.
Oceanside, NY 11572

Make the check payable to the treasurer, Ron Fetzer.

If anyone is aware of other programs which translate pictures (Micro-Painter, MicroIllustrator, etc.) to the Visualizer format, we would appreciate hearing from you.

Printing Utilities

Are you tired of wasting half a page printing 40-column documentation files?

Thomas J. Andrews, of the ACE of Syracuse group, has written a program called Print Star. It reads 40-column text files and formats them into two or three columns, which can be printed at six or eight lines per inch on standard 8-1/2 by 11 paper. Print Star requires 48K, at least one disk drive and an Epson-compatible printer.

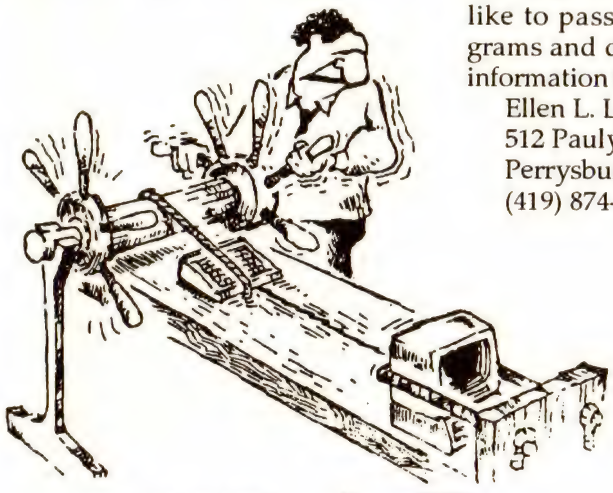
Tom has also written a program (COL40) to convert wider text files into 40-character format to use with Print Star. Tom is a unique shareware author. His fee is simply a letter with suggestions for a better program. He wishes to develop Print Star into a multi-purpose text file printer that is both versatile and easy to use. To accomplish this, he is asking for input on what *you* would like to see in such a program. Send your suggestions to:

Thomas J. Andrews
7805 RS Route 20
Manlius, NY 13104

For copies of these programs, contact Ken Wickert, 8-bit VP of the ACE of Syracuse, at (315) 458-6077 for instructions on ordering by mail.

If you have systems you would like to have reviewed, programs you have found particularly useful or other information you would like to pass along, send the programs and documentation and/or information to:

Ellen L. Lentz
512 Pauly Dr.,
Perrysburg, OH 43551
(419) 874-7196



THE POWER USER

SPARTADOS, HARD DISKS AND STABILITY

M.E. Stefan-Acta

Welcome to The Power User, a column dedicated exclusively to assist Atari 8-bit users in maximizing the usefulness of their hardware with currently available peripherals and software. Without further ado, let's begin this month's topic.

This month's discussion focuses on solving problems that occur when using SpartaDOS 3.2d with a hard disk system. At this point, you must be asking "What's wrong with SpartaDOS?"

In order for me to answer that question, I must first explain what is right with your Atari. Atari 8-bit computers, as with all other platforms, include routines built into the operating system (OS) to handle input/output (I/O) between the computer and its peripherals. Part of those routines are dedicated to handling disk I/O. The routines built into your computer are nothing short of perfect. No other computer has a more stable, cleaner or friendlier set of routines.

The Problem

Unfortunately, the OS routines do not have built-in support for high speed drives. Therefore, when ICD created SpartaDOS, they had to provide routines in the DOS itself to handle communications with the disk drives. The SpartaDOS built-in routines did a decent job at handling the US Doubler Ultra Speed mode. However, ICD was not able to make their routines nearly as stable as Atari's OS routines. As a consequence, SpartaDOS has an unusually high tendency to scramble your directories.

This is not a problem for floppy drives users because SpartaDOS does a very good job at communicating with floppies. And, in the unlikely event that a directory gets scrambled, it's fairly easy to recover.

However, for those of us lucky enough to own a hard disk, it's a completely different situation. When using SpartaDOS with a hard disk, there is a high probability it will scramble your directories due to the DOS routines' failure to close open files automatically.

The Solutions

There are a number of solutions to this problem. You could get the SpartaDOS X-cartridge, since it's been reported not to scramble your directories. However, it is too incompatible and has too many bugs for me to recommend it to anyone. My opinion is that all users should stay away from this product.

Another solution is to use MyDOS 4.5. I can say from personal experience that it will not damage your directories. I can further state that its probably the best hard disk DOS available for the Atari 8-bit computers. However, no good BBS systems run under it, and for that reason, I can not use it. (David Hunt and Bob Puff are working on making their BBS programs compatible with MyDOS.) I can only recommend MyDOS to people who do not run a BBS.

The final solution involves patching X32D.DOS to work like it should. All of the patches discussed here are available from many BBSes across the nation.

The first patch I can endorse here is X32C.DOS. It's a patch of SpartaDOS routines that attempts to get them to work right. It does a good job, but it is not nearly as stable as MyDOS.

The next patch worth discussing is X32P.DOS. This patch increases the available memory in your computer by 1K. That's all it does. However, you can use this patch with the X32C.DOS patch. If you use this patch, you loose BASIC XE compatibility. But, to be honest, that is no big deal. Therefore, you can have increased stability and increase your memory at the same time.

The last patch I will discuss here is X32Z.DOS. This was designed for use with the US+ OS from CSS. It forces SpartaDOS to make direct calls to the Atari OS routines in order to do disk I/O. This patch produces the best results, since it cuts the problem from its root. Furthermore, this patch can be used concurrently with X32C.DOS and X32P.DOS. The result is the most stable, most powerful, and friendliest DOS you can have in your Atari 8-bit computer.

There is a price to pay—you lose Ultra Speed mode unless you have the US+ OS or a Black Box. That aside, I personally use this DOS and can recommend it to all hard disk users out there.

In conclusion, there are two viable solutions. You can throw away SpartaDOS and use MyDOS instead, or you can patch SpartaDOS into X32CPZ.DOS and have the most powerful, reasonably stable DOS for the 8-bit Atari.

Next month, we'll look at task switching with SnapShot. See you then!

PROGRAMMING KIT FOR THE 8-BIT

Ellen Lentz (ACCT)

Here's another great package from Ron Fetzer of the Ol' Hackers Atari Club of Oceanside, New York. The Programming Kit consists of three disks—an improved Turbo BASIC programming language; a compiler which compiles both Atari BASIC and Turbo BASIC programs, making them run 10-15 times faster; a tutorial (with many examples) that teaches you how to do programming in a structured, modular way; programming modules that can be ENTERed and used in your own programs; and tutorials on Arrays and five different types of Sorts. The Programming Kit is designed for the beginning and intermediate Atari user.

A Little History

Turbo BASIC was originally written by Frank Ostrowski from Holland and has been around for some time. It works only on the XL and XE computers, although there is a version available for the 800. Turbo BASIC is completely compatible with Atari BASIC and runs five times faster. In addition to the regular Atari BASIC commands, you get 42 more commands and 22 more functions! You have a usable RAM of 34,021 bytes, which is 1,747 more bytes than you get with Atari BASIC.

Turbo BASIC has been improved by John Picken of the Garden City ACE in British Columbia, Canada. The Time$ function has been fixed so it runs *on time* and does not gain 12 minutes each hour. To create a self-booting file, you now can give it any name but the extender has to be .ARB (Autorun BASIC). The prompt changed from READY to TURBO. This will let you know you are using the NEW North American (NTSC) version. For advanced users, there is a machine language routine which allows you to vector anywhere you want with the BYE statement.

The Kit

All three disks, both sides, contain Turbo BASIC and are self-loading. Hold down the OPTION key while you are booting them up.

The Compiler is on side A of Disk 1. The compiler instruction screen is now in English, written by G. Meyer of Ames, Iowa. Also on Side A is a self-booting program which allows you to read or print the documentation for the Compiler and the Turbo BASIC Update.

As an aside, there are several advantages to using a compiler. BASIC reads each line and converts it into machine language before it can be executed. If it finds a GOTO or GOSUB, it starts at the top of the program and reads each line until it finds the line referenced. In the compiler, each line is converted to machine language and the appropriate references are stored. It saves the time of conversion and searching, thus making the program run much faster.

The expanded documentation for Turbo BASIC, written by Dave and Laura Yearke of the Western N.Y. Atari Users Group, is on side B of Disk 1. It is an autorun file which allows you to read or print the Turbo BASIC documentation.

Disks 2 and 3 are the products of Ron Fetzer. Ron is a retired math and computer teacher. His experience in teaching is reflected in the excellent tutorials on these two disks. Disk 2, sides A and B, are self-loading and present "Programming Made Easy," with details on how to write very large programs using Turbo BASIC and structured, or modular, programming techniques. As professional programmers do, you break a program down into smaller pieces, write them and then put them together to make the program.

You are shown how to write a block diagram and a skeleton program. This is what I call Top-Down, Bottom-Up programming. You create the modules you are going to use (Bottom), then plug them into your skeleton program (Top), by using the PROCedure-ENDPROCedure commands. Once you learn this technique, your programs become easy to read, easy to take apart, and are mostly self-documenting.

Disk 3, side A, contains close to 40 modules and utilities you can use in your own programs. Side B contains instructions on how to use them. In addition, lines 1 to 9 on each module contain explanations of what to do and how to use the module.

The modules were stored with the LIST command, so you can load them into a word processor and change variables with the SEARCH/REPLACE command if you wish. (Be sure to save them out as ASCII.) You then load them into your program with the ENTER command. This will replace any command(s) with the same line number(s), so be sure you have RE-NUMbered appropriately.

The modules do everything from DOS commands to screen printing to sorting. There are five different Sort modules included. The utilities include such things as a program to change the cursor shape, a program to give you center positions for strings, a HEXI/DECI converter, a word counter for your text files, and a loan program module. All the modules are very short and easy to understand.

Programming Made Easy shows you step by step how to use the modules, how to string them together to form a coherent program and how to renumber your code. It also shows you how to use your RAMDISK as an effective tool in constructing a program.

Disk 3, side B, in addition to "How to Use the Modules," contains text files on "How To Use Arrays" and "How To Do Sorting." These are self-loading and can be read or printed.

You cannot sort unless you use an array. Since String Arrays are not allowed in either Atari BASIC or Turbo BASIC, you are shown how to write "Pseudo String Arrays" that act exactly like regular string arrays. Short programs demonstrate these techniques.

The text file on sorting explains the Bubble Sort in great detail. There is also a String Bubble Sort. In the Mini Sort, the smallest element is put first in the array until the whole array is sorted. The Shell Sort is also explained. In the Relational Sort, you have two arrays that must retain their relationship, but only one array is sorted. This kind of sort would be used, for instance, for a Telephone Directory where the names are sorted but the numbers always have to stay with the names.

Ron is to be congratulated on this excellent Programming Kit. As you might recall, he is also the author of the Disk Management System, reviewed here in an earlier issue. To obtain this three-disk package, send $7.00, with a check made out to the club's treasurer, Ron Fetzer, to:

Ol' Hackers AUG, Inc.
c/o Alex Pignato

Oceanside, N.Y. 11572

Keep them coming, Ron. As long as we have programs like yours, we really can enjoy our *Happy Atari Computing.*

Put the Power of the Latest Computer and Color Desktop Publishing Technology to Work for You!

What Is Desktop Publishing?

There's a revolution going on out there. In the past, you had to pay top dollar for B&W and full-color, camera-ready copy. Traditional typesetting and paste-up was a time-consuming and expensive process.

Today, Desktop Publishing (DTP) software has the power and flexibility to give you low-cost, high-quality documents, even in glorious full color!

The personal computer of today can run circles around the mainframes of ten, or even five, years ago. The DTP software of today equals or surpasses the capabilities of today's mainframe page design software.

There's a revolution going on out there, and Desktop Publishing is winning.

Use the Power!

At Unicorn Publications, we put the power of today's personal computer and desktop publishing software to work for you.

From textual reports to full-color, graphic-oriented documents, we can give you quality output that pleases the eye and the pocketbook.

Join the revolution today!

Unicorn Publications DTP Price Guide

Laser Printed Pages	
1-25	$.60

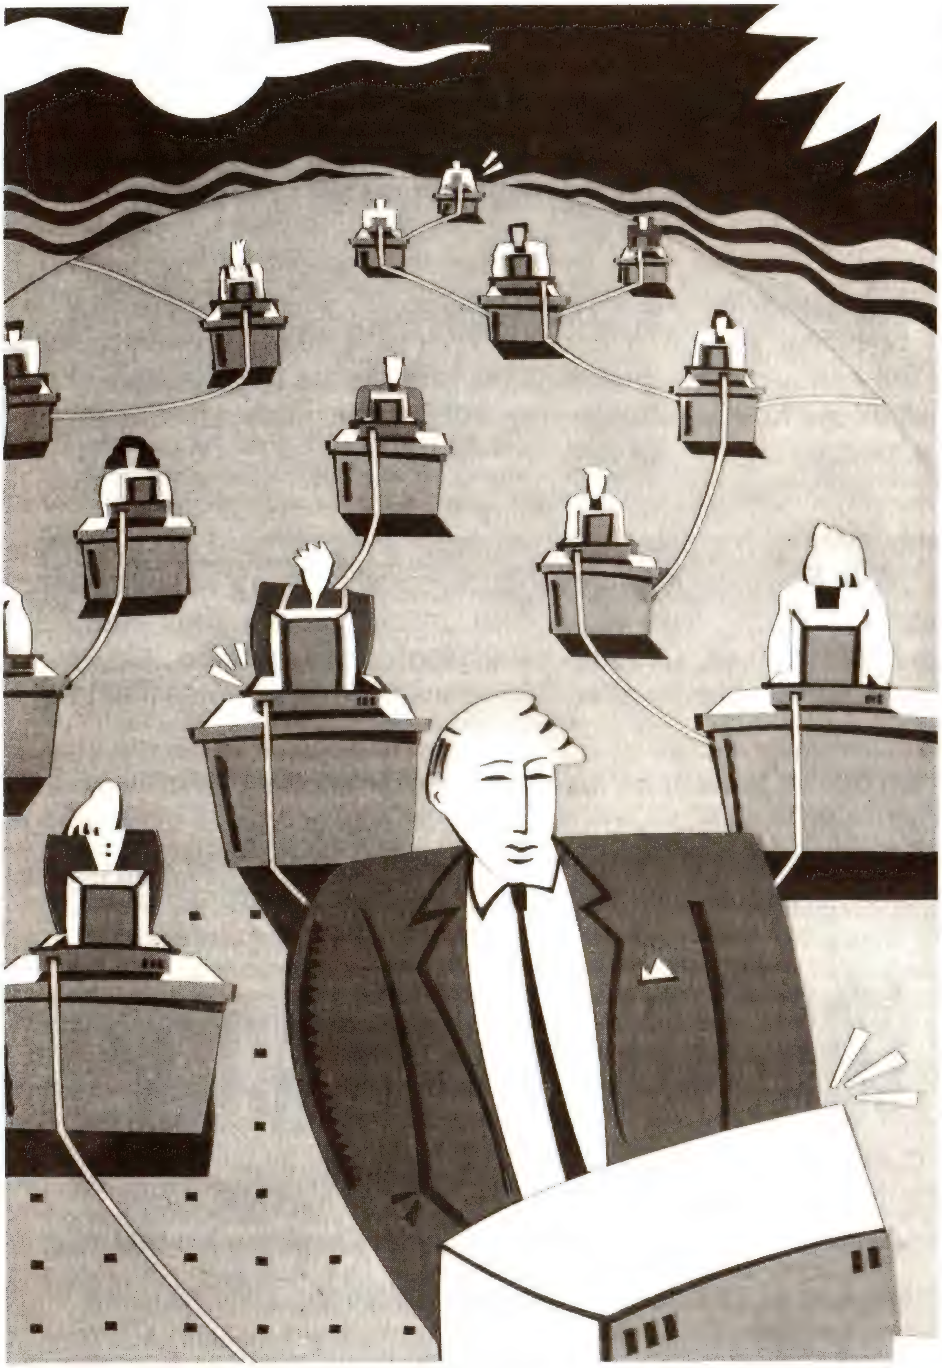
CompuServe puts the whole world at your fingertips.



When you connect your computer to CompuServe, you join the world's largest international network of people with personal computers. You have access to more than a thousand services that offer a source of support, information, entertainment, communications, and benefits of all kinds.

A world of advantages.

CompuServe lets you take advantage of your personal computer in a thousand different ways.

For instance: communication. You'll get invaluable personal computer software and hardware support from other CompuServe members, as well as product manufacturers, all over the world. Meet in special interest forums to discuss everything from science fiction to sharing software. And keep in touch through electronic mail and faxes, as well as by "talking" over 72 CB Simulator channels.

CompuServe also lets you shop coast-to-coast at hundreds of nationally known stores and take advantage of a world-class reference database. It gives you access to the latest national and international news. And our special financial files offer complete statistics on over 10,000 NYSE, AMEX, and OTC securities. You can even trade online with local discount brokers.

Global travel and world-class fun.

CompuServe also offers airline schedules, so you can check out the bargains and book your own flights on almost any airline worldwide. You can get travel news, frequent flier information, and country and travel facts. As well as listings from over 30,000 hotels.

Plus, there are games. Sports, trivia, educational, space fantasy… you can go it alone or compete against players from all over the world. Only on CompuServe can you test your wits in the only online TV-style game show with real prizes, or leave the earth entirely in one of our interactive space adventures.

Just give us a call.

To become a CompuServe member, you need a computer and a modem. We'll send you everything else, including a $25.00 usage credit with your Membership Kit. In most places, you'll be able to go online with a local phone call.

To buy a CompuServe Membership Kit, see your nearest computer dealer. To receive our informative brochure or to order direct, call us today.

And put the whole world at *your* fingertips.

CompuServe®

Has your local Atari dealer headed for greener pastures? Are ads for Mac Classics and 386's appealing to you?

We have a solution.

Atari Advantage Magazine

The editors of Atari Advantage Magazine would like to introduce you to a new way of thinking about your Atari ST/TT computer system. You don't have to feel like you own a second rate machine just because the company who built it hasn't done much to promote it. You don't have to muffle your voice with your hand when you respond to someone's question about which computer you own. You especially don't have to give in to the temptation of a PC clone or Mac.

We believe that if we can show you how to take full advantage of the things that your Atari can do right now, those doubts you might have about your decision to buy one will disappear like roaches in a Raid commercial. You don't have to be "into" music to enjoy the "Atari Advantage". You don't have to be "into" games, Desktop publishing, Desktop video, programming, education, art, business, or any of the other varied and assorted things people find to do with their Ataris. But we'd imagine you are.

In every one of our issues we intend to pack as much information as we can to help you take full advanatage of your Atari. From software and hardware reviews to helpful tutorials, to feature articles about the exciting things going on right now in the Atari market, you will find no better source for up to the minute useful information than Atari Advantage Magazine.

Experience the Atari Advantage!

HIGH TECH ON THE HIGH SEAS
A REVIEW OF LUCASFILM GAMES' STRIKE FLEET

DAVID ELMORE
ACCT

Being an avid computer wargamer, when a friend of mine bought Harpoon for the IBM, I drooled with envy. I wished and wished the game would be ported over to the ST, but to no avail. So, when I found Strike Fleet on the shelf at the local computer store, it was an instant sale. I haven't been disappointed.

Strike Fleet is a simulation of Modern Naval Combat. No longer are the 16" Guns of the Iowa Class battleships the most feared surface weapon. Today, surface ships engage each other outside of visual range, not only with aircraft, but also with a wide variety of missiles. Surface combatants trade gunfire only after surviving each others' missile barrage.

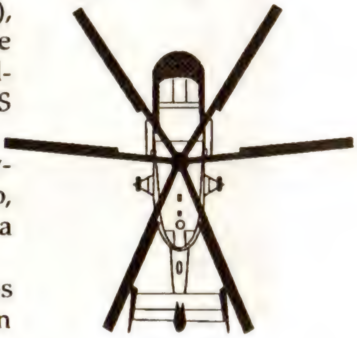
This game simulates this well, for the action is furious, the playability high and the realism only slightly flawed. The game contains 14 scenarios—the first six being Training and the last eight tied together as a campaign.

The first scenario teaches you to be calm in the face of incoming missile attacks and allows you to learn how to fire Surface to Air Missiles (SAMs). The second scenario teaches you how to control more than one ship and how to hunt submarines using helicopters. Each successive scenario teaches you a little more about the game until, finally, you are ready for the ultimate test—the campaign.

While playing the campaign, when you finish a scenario, you are given a ranking and an access code. This code tells the computer not only what campaign scenario you wish to play next, but also what your last ranking was. The object of the campaign is to finish with as high a ranking as possible.

The scenarios are fought in four different locations—the Atlantic Ocean, the North Sea, the South Atlantic and the Persian Gulf.

Enemy forces come in all shapes and sizes: five different types of submarines (from the tiny Salta Class of Argentina to the impressive Victor III Class of the USSR), ten different types of surface ships (from Iran's Light Patrol Crafts to the massive 28,000 ton Kirov Class Missile Cruisers, the ships which the manual states, "were almost single-handedly responsible for the recommissioning of the Iowa Class of US battleships."), three different types of aircraft and 13 different types of missiles.



At your disposal are 10 different types of ships, from the light Pegasus class Hydrofoils to the Ticonderoga Class AEGIS Cruiser. Most ships carry one, if not two, helicopters. These are not only good for hunting submarines, but I like to launch a bunch of them and do an airstrike against surface ships with torpedoes.

When you load a scenario, you are given the option of adding or subtracting ships from your fleet. Each ship class has a point value. If you subtract ships, you gain points which can be spent on a different type of ship. The fewer points you use, the higher your final ranking will be, the theory being that if you can do the job using fewer ships, you must be a better Commander. Once you have chosen the ships you wish to use, you're off to the Battle Zone.

Each Battle Zone has three map magnifications: Fleet, Task Force, and Ship. To get from Fleet magnification to Task Force magnification or from Task Force to Ship magnification, you move the cursor to the area you wish to magnify and left click the mouse. The area, which was shaded gray, now zooms in.

At Fleet magnification, you may only give orders to your Flagship, the one ship you have in charge of the fleet. Whatever you tell your Flagship to do, the others will also do. You can set the destination for the entire fleet by moving the cursor on the map to where you want the Fleet to go and right clicking the mouse. All ships will head for the destination. The Flagship will move no faster than the slowest ship in the Fleet, so if the Flagship is told to move at full throttle, all ships in the fleet will match speeds so nobody gets left behind.

At Task Force magnification, you may give orders to individual ships. You may have them leave a Fleet and start a new one. You may then have ships join the new Fleet or, if already split off, rejoin the old.

To leave a Map and go to the ships, you click on a button marked Bridge. The Bridge is where all battles are fought. From here you may fire guns, launch missiles or torpedoes, launch helicopters, scan Radar or Sonar displays, manually change course or speed, change ship status from Rest to General Quarters and back, return to the map display or move to a new ship.

While on the Bridge, you get a visual picture of what's directly in front of you. Helicopters and ships can be seen moving in front of you. If the enemy is close enough to you and you're firing guns, you can see the splashes on the water from your misses.

On the lefthand side of the Bridge display is your Ordnance Board. It keeps a running total of each ship's eight different Weapon systems. Each ship may carry Long Range Anti-Ship Missiles, Short Range Anti-Ship Missiles, Anti-Aircraft Missiles, Dual-Purpose Cannon Shells, ASROC Anti-submarine Weapons, torpedoes, Chaff bursts and Phalanx bursts.

On your Radar or Sonar display will appear ships, aircraft, missiles and torpedoes. If you point to one of these and left click, you get a Binocular view of the target. You can then see the target's course, its speed, its bearing to your ship and the distance it is away.

If attempting gunfire, you get crosshairs on this display. Place them where you think you can score hits and blaze away. If you wish to fire a missile at the target, point the cursor to the weapon system you wish to use on the Ordnance Board and click.

There are also two warning lights on the Bridge. *Lock* means a weapon has locked onto that particular ship. *Depth* means a ship is getting into shallow water and risks running aground.

Also included in the game is Remote Targeting. What this means is you can use one ship's or helicopter's Radar to target something for another ship who could not have seen it normally. In practice, this means sending a helicopter out ahead of the Fleet to scout the way. When the helicopter discovers an enemy target, you use Remote Targeting, return to another ship and fire Anti-ship or Anti-Aircraft missiles. All this done without the Fleet coming into danger.

This game is fun to play and exciting. While Harpoon covers a more strategic view of Naval combat, this game gets you up close and personal. The graphics are great, ships hit and damaged have plumes of smoke rising from them. Things get happening so fast you get flustered and make mistakes. When you make mistakes, well, stuff happens.

The game is simple enough; you will become familiar with the game mechanics quickly, but complex enough that this isn't just an arcade game.

As far as reality goes, I have only one complaint. In this game, when a helicopter lands, it is instantly ready to go out again. Not that I'm really complaining. I can't think of a Commander who wouldn't want his aircraft instantly refueled and re-armed as soon as they touch down. On the other hand, this isn't realistic.

Two other things about this game I consider flaws. First, there is no save game option. Campaigns can be ended and restarted inbetween scenarios, but, while playing a scenario, you have to play to the end or quit. The first scenario takes about 15 minutes to play, but one of the campaign scenarios took me 3-1/2 hours to finish!

Second, there is a feature in the game that speeds up the clock, allowing for faster play when things aren't happening. This is fine, but when things start happening, the clock doesn't automatically slow down. Many times I've been sailing along, suddenly, a Bomber appears and launches a barrage of missiles at my ships. Before I can react, *boom!*, they've struck and sunk one or more of my ships. In Harpoon, the clock stops so you can meet the incoming threat. I wish this game did that.

Overall, I consider this game to be a great value for the money. It plays well and is realistic (except for the helicopter turnaround time). I like it a lot and highly recommend it. I hope Lucasfilm Games does well with this title and continues to develop for the ST.

You've listened to your MIDI equipment. Is it listening to you?

Porting from the ST

Making the ST and Portfolio Talk to Each Other

Bill Rayl

Probably the hardest thing an Atari ST user encounters as a new Portfolio user is getting the two computers talking to each other for the very first time.

The Portfolio has built-in software for file transfers via the Parallel Interface and the Parallel Interface comes with compatible transfer software to run on an IBM. Unfortunately, this method cannot be used on an ST, even under IBM emulation. The reason for this is that the ST's parallel port does not use a couple pins that are extremely important to this software.

So, how do you use your ST to transfer software to the Portfolio for the first time? Every article written on the subject in Atari publications so far tells you that you have four basic options:

Borrow someone's IBM and use it to transfer a telecommunications package to your Portfolio.

Buy the DOS Utilities card from Atari or an Atari dealer (retail price $89.95). It has XTERM, the PD terminal package of choice for the Portfolio.

Find someone else who owns a Portfolio and has already gotten a terminal package onto it, then have them copy it to your RAM card. (Some people have even gone so far as to send their cards to Don Thomas at Atari to have him give them a copy of XTERM!)

Purchase TransporT from Artisan Software (retail $29.95) and use a null modem cable to transfer your terminal package to the Portfolio.

Of these options, TransporT is the one I'd recommend most...if you want to use only those choices.

> Sometimes, the impossible isn't really all that hard.

You see, all of those articles have missed the least expensive way to get a terminal package onto your Portfolio from your ST. In fact, some of those other articles state that what I'm going to tell you here is impossible.

Other than the cables you'd need to buy anyway to use the Portfolio with a modem, chances are you already have almost everything you need.

The Supplies

All the hardware you need is:
An ST
A Portfolio
The Serial Interface for the Portfolio
A modem cable and null modem adaptor (or just a null modem cable)

Your best option is to use a modem cable with 9-pin female connector on one end and 25-pin male connector on the other. Then, get a null modem adaptor with one 25-pin male end and a 25-pin female connector on the other end. This way, you can use the modem cable minus the null modem adaptor for normal telecommunications.

If all you can find is a modem cable with 9-pin *and* 25-pin female connectors and a null modem cable with both male ends (these do seem to be the most prevalent), don't worry. Just pick up an RS232 Gender Changer with 25-pin female connections at both ends. Your local Radio Shack should carry all of these cables and adaptors.

The ST software you need is a terminal package that supports transfer rates of as low as 110 baud. This includes Flash! and many PD and Shareware packages. Chances are the ST terminal package you already use can handle this.

If not, there's another option. First, you need the Atari Control Panel (or any software giving you the capability to set your RS232 parameters). Since the Control Panel comes with every system Atari sells, it's a good bet you already have it, even if it's not installed. Then, you need a program that can send information out the serial port. I personally used EdHak (available from Clear Thinking) to test this, and it worked beautifully.

As for the files you are going to transfer to the Portfolio, you need the following:

HEXBIN.COM—A utility to convert HEX files into BINARY runnable format. File size: 257 bytes. Checksum: 408D. (Checksums will be explained later.)

XTERM2.HEX—HEX version of the XTERM2 telecommunications package for the Portfolio. Supports Xmodem and ASCII file transfers and lots more.

XTERM2.DOC—Text documentation for XTERM2. You don't really need this file for the transfer to work, but you'll probably need it to use XTERM2 effectively. You can simply leave this doc file on your ST and read it from there or print it out for reference.

CHECKSUM.COM—A small utility that gives you a Checksum corresponding to a given file. This file is optional to the process, but it helps. File size: 129 bytes. Checksum: 30A7.

These files are all Public Domain files available from the Portfolio Forum on CompuServe (GO APORTFOLIO). If you're at all interested in the Portfolio, this is *the* place to be. There are literally hundreds of programs for the Portfolio there...all just a quick download away.

The files are also available on this month's ST disk, in the ST2PORT.APP self-extracting archive.

The Starting Block

We'll assume you have all the files listed above somewhere on your ST. For this article, I'm going to describe doing the transfers using Flash. If you are using some other terminal package, you may need to slightly modify these directions.

Start with both the ST and Portfolio turned off. It helps if you have both machines fairly close together, so you can type on them both without moving from where you are.

Plug the Serial Interface into the Portfolio. Attach the modem cable's 9-pin end to the Interface, plug one end of the null modem adaptor into the "normal" 25-pin end (adding on the Gender Changer if needed) and then plug the whole thing into the ST's serial port.

On the ST Side

Boot up the ST and run Flash. Set the baud rate in Flash to 110 baud (use Alt-B and click on the "110" button). While in the dialog box, make sure you have 8-bits, no parity and 1 stop bit set, as well. Click OK when done. If you want to watch the file's progress as it sends, you should also set Flash to Half Duplex (type Alt-P).

Now, we'll go set the ASCII transfer options. Press the right mouse button to switch to the GEM screen. Select "Ascii UL/DL" from the Edit drop down menu. At the dialog box, set LINE PAUSE to its maximum of 9 and turn everything else off *except* METERING, which should be turned on. Click OK.

Go to the Upload drop down menu and select "File Ascii." Use the File Selector to find the file HEXBIN.COM. Click *once* on the file, but don't send the file yet (i.e., select the file but don't press Return, don't click OK, and don't double-click the file!). Place the mouse pointer right above the OK button and leave it there.

On the Port Side

Boot up the Portfolio and get into Setup. Select "RS232 port..." from the menu. Set the Baud rate to 110, Parity to None, Data bits to 8 and Stop bits to 1.

Then, select Initialize! from the menu. If you get a

"Communication error" message the first time, try Initializing the Interface again. If you repeatedly get this error, there's a serious problem with either the Interface or its connection to the Portfolio. Turn the Portfolio off, make sure the Interface is firmly connected and try Initializing it again.

Once the Interface is initialized, get to the DOS prompt (press Esc a couple times). At the DOS prompt, path to your RAM Card by typing A: and hitting a carriage return. Then, type the following *(Don't* hit a carriage return after this yet!):

```
COPY AUX: HEXBIN.COM
```

Ready, Set...

The next step takes a little bit of timing on your part. Thankfully, you don't have to be too quick about this, though. What you need to do is press Return on the Portfolio and then click the ST's left mouse button (or press Return) *before* the Portfolio times out trying to copy from the Serial Interface. You'll know if the Portfolio times out, you'll see an "Abort, Retry, Ignore" message on the Portfolio but the ST is still sending.

If the Portfolio does timeout, simply type 'A' to Abort, retype the COPY command (or press and hold the Fn key, followed by F3) and re-setup for the file transfer on the ST side. Then, try it again.

If everything goes well, the ST will finish sending while the Portfolio continues to display "AUX to A:\HEXBIN.COM." A few seconds later, you'll see

```
Not ready error
Abort, Retry, Ignore?
```

Yes, that's the same message you'll see if the Portfolio times out. That's why it's important that you can recognize the difference between success and failure here. If the ST is still sending and this error occurs, the transfer has failed. If the ST has finished sending and you see this error, everything is great.

Type 'A' to Abort and type DIR (followed by a Return). You should see the file HEXBIN.COM safely stored on the RAM Card with a file size of 257 bytes.

Round and Round

Repeat the above file transferring steps for XTERM2.HEX and, optionally, CHECKSUM.COM. You can use CHECKSUM to verify that the files transferred successfully. At the DOS prompt, simply type CHECKSUM, followed by the name of the file you want to test and a return. For instance, to test HEXBIN.COM, enter the following (with a carriage return) at the DOS prompt:

```
CHECKSUM HEXBIN.COM
```

Once you have both HEXBIN and XTERM2.HEX on the Portfolio, you're in the home stretch. At the DOS prompt, type the following line (with a carriage return at the end):

```
HEXBIN XTERM2.HEX
```

The HEXBIN program will now convert the hexadecimal values in XTERM2.HEX into a binary, executable program. The output file is automatically called RESULT.OUT. Type, again from DOS and with a return at the end:

```
REN RESULT.OUT XTERM2.COM
```

The new program file should be 2,898 bytes in length and have a checksum of 99F3. If not...try, try again.

That's All Folks!

You should now have a working terminal program on your Portfolio. Turn your Portfolio and ST back off (just to be safe) and disconnect the modem cable from the ST. Keep the Serial Interface connected to the Portfolio. Remove the null modem adaptor or null modem cable and use the normal modem cable to connect the Interface and Portfolio to your modem.

Boot up your Portfolio and go to Setup again. Reset your RS232 port to whatever your highest baud rate is on your modem—XTERM2 can handle 9600 baud with no problem! You can skip Initializing the port, because XTERM2 will do it for you.

Now, get to the DOS prompt again, path to A: if necessary, and run XTERM2 by typing "XTERM2" (without the quotes) followed by a carriage return. You should be greeted with XTerm's copyright notice and mini help screen. From here on out, anything you type in is sent directly to your modem. If using a Hayes-compatible, you can use ATDT to dial the modem, etc. Support files on CompuServe can even give you a Dialing Directory of sorts for XTerm.

Make sure to read XTerm's documentation and keep a hardcopy of the docs handy for reference.

That's all there is to it, folks! It may seem a little convoluted, but it's no different than null modem file transfers to any other computer...except you're starting out with no transfer software on one of the machines.

I should note here that it may not be necessary to use 110 baud *and* set metering to its slowest possible option. Better to be a little slower than necessary than too fast, though. I have had only mediocre success in transferring files at 300 baud, so I don't recommend using faster than 110 baud. At 110 baud and metering set to 9 in Flash (or Slow in EdHak), I've had 100% success with over a dozen file transfer attempts.

Another important note is that you should not try this method with larger binary programs (like ACOM.EXE or even XTERM2.COM). It simply will not work, because these files contain control characters that stop the transfer dead. Things like Control-C, Control-D, etc. end the transfer. Play it safe and transfer the files listed in this article. Then, use your newly created XTERM2.COM to do Xmodem file transfers from then on. Of course, you can use this method at any time to transfer ASCII text files to and from your Portfolio.

Sometimes the impossible isn't really all that hard.

WHO READS AIM?

Analysis of the Reader Survey

Patricia Snyder-Rayl

This article has been long awaited by those who answered the survey questions we ran in an issue some time back. The response was typical of mail-type campaigns. I'd like to thank those people who did respond, and if you're not one of them, see how you fit into what the survey results show!

The survey started off with the sex question. *Are you male or female?* The answer wasn't a surprise to anyone who's a member of an Atari user group. Just over 94 percent of AIM readers are male, and 4 percent are female. The remainder is questionable! Maybe there were people who weren't sure.

Next came the age question. *How old are you?* A little over 33 percent are aged 30-40, while almost 29 percent are 40-50. The next highest percentage was almost 16 percent, aged 20-30. So, over 3/4 of the AIM readership is between the age of 20 and 50. A small fringe, about 8 percent are over 60 and under 20.

Probing even more personally than your age and sex came the third question. *What is your income?* The results show 63.5 percent of AIM readers earn between $30,000 and $49,999 in annual income. The rest is spread out pretty evenly at the lower and upper portions of the scale. This would seem to correspond to the age results, since the older people are, the more they tend to make—to a certain point.

The next question was for our use, mainly. *How many people read your copy of AIM?* The percentages show us that almost 64 percent don't share their AIM with anyone, while two people read each issue for 29 percent of our readers. The percentages got rapidly lower with higher numbers of readers.

Following this came the user group question. *Do you belong to a user group?* Not surprisingly, since AIM's backbone is clubs, just over 75 percent of our readers belong to a club, while 20 percent do not. Again, if you think about it, these results were expected.

This next question had a little more variety to the answers, so the results were not so cut and dried. *What Telecommunication services do you use?* GEnie came out on top at 31.8 percent, with CIS right behind at 21.7 percent. Delphi received 10.1 and Other (BBSes presumably) got 14.4 percent. This doesn't total 100 percent, since some people didn't answer, most likely because they didn't have a modem.

Next came the usage question. *Do you use your computer for business or personal use?* The results broke almost evenly over personal and both answers. Personal usage received 49.2 percent of the total, while Both won out with 50.7 percent of the answers.

Now that we knew what, in general, people used their systems for, we wanted to know how many people used it. The highest percentage went to single use with 36.2 percent. The next highest was three people at 21.7 percent followed by 2 people at 18.8. Four and five users were only small percentages.

Now that we knew how many people used the system, we wanted to find out what that system was. *What system do you own?* The choices were 8-bit, ST and Both. Just over 28 percent owned only 8-bits, and 38.8 percent owned only STs. Almost 33 percent owned both systems.

The next question was for the people who answered that they owned an ST. *Have you upgraded to TOS 1.4?* A surprising 63.8 percent said no, while 36 percent said yes.

How long have you owned an Atari computer? People who have owned an Atari for over seven years make up 55 percent of the respondants. After that comes five to six years at 20.2 percent. Three to four years is 13 percent with two years or less at 7.2 percent.

More Statistics

The next few questions were rather boring and dealt with the actual hardware setup in the systems people used. This can easily be summarized for you. Over 73 percent of AIM readers have double-sided drives (this includes 8-bit as well as ST owners). Almost 87 percent own color monitors, while 45 percent own monochrome monitors (readers could check both types). A very small percentage own Multisync or Moniterm monitors.

Almost every reader of AIM has a dot matrix printer—this was 92.7 percent. Also, just under 80 percent own modems. The next big winner was a hard drive at 53.6 percent. Over 10 percent of the respondants owned a Mac emulator. Just under 6 percent own a Portfolio, and 11.5 percent own a Lynx. Thirteen percent of AIM readers own a non-Atari computer.

The "wanna buy" list is a lot more fuzzy in its results. The largest percentage for equipment readers want to buy was a laser printer at 17.3 percent. Following that came a hard drive and a CD-Rom at 15.9 percent each. After that comes a removeable hard drive, a Mega/STe and a Mac emulator, all with 11.5 each. A modem and a non-Atari computer tie at 8.6 percent to round out the results.

Next, we asked people to tell us, in a ranking of one to 14, what they did most with their computers. Because the answers varied so widely, I went the easy route and took only the first two preferences. Word processing was the big winner at 34.8 percent. Telecommunications and Entertainment/Games tied at 14 percent each. Following that came Databases/Spreadsheets and Desktop Publishing at 7.4 percent each.

What level of computer user would you say you are? The answers were Intermediate at 68.1 percent, Advanced at 23.1 percent and Beginner at 5.7 percent.

The final question dealt with the articles in AIM. Did the respondant think the articles in AIM were dull and boring or terrific and exciting. It seems most AIM readers (63.7 percent) think articles are informative and (62.3 percent) easy to read. Almost 58 percent say the articles are just the right size, while a little over 17 percent say they're too short. Of course, if you don't agree with this, please let us know! <grin>

Enough Statistics, already!

So, the bottom line is, if you're reading this article, you're probably a guy, aged 30-40, making about $40,000 a year, who doesn't share his AIM with anyone! You also belong to a club, use GEnie or CIS, and own a color monitor, dot matrix printer and modem. You also are an intermediate computer user who likes to type and play games and thinks AIM is just great! Glad to have you aboard!

MEGA-Check
The Ultimate Finance Manager

Take charge of your finances with the most complete finance manager for the Atari ST

☑ Pay any bill with a single mouse click or keystroke
☑ Built in ***PayMinder*** alarm system
☑ Fully automated checkbook balancing
☑ Print checks on any printer
☑ Support for any number of checking, savings, investment and expense accounts
☑ Also allows grouping of accounts
☑ Full featured report generator (with scheduler)

BRACE
presents the ....

Blue Ridge Atari Computer Enthusiasts - Computer STudio
Blue Ridge AtariFest '92
Asheville, NC

When: Saturday, July 18, 1992
Where: Westgate Shopping Center - Asheville, North Carolina
Time: 10:00am - 6:00pm
Show Registration: $2.00 per person (advance registration)
$3.00 per person at the door

Advance registration ensures you will receive complete show information by mail as well as register you for all door prizes to be given away. It is not necessary to register all members of your family if you choose not to, as actual admission is free. But registration is required to be eligible for door prizes and other specials that will be offered visitors.

Banquet: Saturday evening immediately following the show.

Computer STudio has finalized arrangements for an after show banquet at the Pisgah View Ranch. Dress casual for a real down home country party in the mountains! Dinner will be served family style... as long as you keep eating, they'll keep serving! After dinner, there will be live entertainment in the air conditioned barn, guaranteed to bring out the 'country' in everyone! Separate advance reservations are required for the Banquet. Cost is $17.50 per person (children under 6 are half price)

Area Map

ST/TT Disk

All files on this disk are self-extracting archives created with DoubleClick's Self-Extracting ARC program DC SEA! To use these programs, simplydouble click the files. Then, click on Extract and select the drive/folderto which you want the extracted files saved. Click on Verbose to get a listof the files in each archive or Exit to abort.

Here's a short description of the files on the July '92 disk. For morecomplete docs, see the text files contained in most of these archives.

89A_87A.APP—A small utility to convert GIF images from the 89a format to the more widely accepted 87a format.

DASH.APP—Mr. Dash is a Boulderdash clone from Germany. Great sounds, good graphics and very playable. Mono and color versions included.

GCHESS.APP—GNU Chess is one of the best chess games around, and now it's available on the ST! This version features a graphical user interface, ability to edit the pieces and the board, CPU vs. Human or CPU vs. CPU modes, a save game option and lots more. Full documentation and C++ source code included.

JAMES12.APP—"James the Desktop Butler" desk accessory from Luxembourg.This multi-function DA features a screen saver, mouse accelerator, diskstep rate setter, VBL emulator, VT52 emulator, virus checker and about twenty other functions. Version 1.2P.

MITHRIL.APP—A 3D animation that runs in low or high resolution on any ST/STe/TT. Mithril generates images itself rather than loading them fromdisk. In low resolution, it does gradual color cycling and uses the expanded STe/TT color pallete if available. In high resolution, it has fine shading and slightly smoother animation. Written by Mark Slagell of SilkWare.

MUTA.APP—Metamorphic Animator Desk Accessory for CAD-3D with the ability to output the intermediate 3D objects to a file, so you can use other rendering programs on them.

POOLFX92.APP—An update to Poolfix3 and Poolfix4. Fixes a couple of serious problems in prior versions of Poolfix. Freeware from Sweden.

SCAN4PIC.APP—A great little graphics utility from Stephen Coates of the UK. Scans selected programs for recognizable graphics screens and lets you save them out for viewing with your favorite picture viewer!

SERIALFX.APP—A program and CPX to fix problems in the ST/TT Modem 1port (for STE/TT users) or the Serial Port (for ST users). Allows you to lock the port into RTS/CTS mode, to support use of RTS/CTS with programs that do not support RTS/CTS (like Flash 1.6). Also fixes the RTS/CTS problems of overflowing modem buffers encountered with some modems. SerialFIX works with all current versions of TOS (1.0 to 2.06/3.06).

ST2PORT.APP—Four files mentioned in the "Porting from the ST" article in this month's issue. HEXBIN .COM converts HEX files to binary, CHECKSUM.COM determines a file's checksum, XTERM2.HEX is the HEX version of a popular PD terminal program for the Portfolio and XTERM2.DOC is the doc file for XTerm2.

TYPIST.APP—An excellent Typing Tutor program with support for QWERTY and Dvorak key layouts. Various typing exercises teach you how to type or help you improve your typing speed and accuracy. Includes C source code!

Mac/Spectre

Each AIM Mac/Spectre Disk of the Month is a double-sided disk packed with some of the best PD and Shareware programs available each month. The disks are available in either Macintosh or Spectre formats. All files are self-extracting Compactor Pro archives—just double click to extract!

Here is a short description of the files contained on the July '92 Mac/Spectre Disk of the Month:

ATAXX—A board game that's very similar to Othello, but with some interesting twists. There are options for board size and opponent type (human or computer).

BBEdit 2.1.1—An all purpose text editor with lots of interesting features including pattern ("grep") search ability. Full documentation is included.

Caps Lock Notify—A very small utility that simply notifies you each time the Caps Lock key is pressed.

DESEA—DESEA strips the "self-extracting" code from most types of self extracting archives, saving considerable disk space. The one drawback is that you'll need an archiver (or unarchiver) program to unpack your files. Complete documentation is included.

Stuffit Expander —This application unpacks most types of compressed files including Compact Pro, Stuffit 1.5.1 and Stuffit Deluxe/Classic.

Print2PICT—A chooser document that allows you to send printed output to a PICT file. You can then use that file in any Macintosh application that accepts PICTs. Great for mixing text and graphics.

DISKS OF THE MONTH

Disk

Remember? v2.3—Ever forget Grandma's birthday? A car payment? Where you left the kids? Well, forget all that...and use Remember? v2.3. You'll never be late for another taping of "Lifestyles of the Rich and Famous" again.

Retriever Light—A neat little database DA that's great for keeping track of all sorts of stuff. Simplicity is the name of the game here. The DA is easy to set up and use, but it is still quite powerful. A very useful desk accessory.

TOM✓INIT II—An init that allows you to have "tear off" menus in all applications. It even allows you to tear off hierarchical menus. Great for use with large screen monitors. Never again make those tiring trips all the way back to the menu bar.

8-bit Disk

Each AIM 8-bit Disk of the Month is a single-sided, single density "flippy" packed with software. To extract files in the ARC format, you need the UNARC.COM utility. To decompress files with a DCM extension, you need DISKCOM3.UTL. Both programs are available from most BBSes, user groups or you can purchase the April/May '91 AIM 8-bit Disk.

Here's a short description of the files on the July '92 8-bit disk:

SIDE 1

ALFBACK.ARC—A hard drive/MIO backup program featuring file compression to save on disks!

CGSDEV.ARC—Developer's Kit for the Color Graphics System from Tom Hunt and CTH Software. Contains all the info a programmer or sysop needs to install CGS on his/her BBS. [The CGS system for viewing these graphics appeared on the May '92 AIM disk.]

FATBACK.ARC—A great program for hard drive owners using SpartaDOS, FatBack saves your drive's FAT tables and directories to a file. If the drive's FAT tables get munged, simply restore them from your backup!

USR.ARC—Contains two LISTed BASIC programs and a picture file. USR.LST contains several USR routines you can add to your own programs The routines are described in this month's A-T-A-R-I article from Paul Alhart. PICTURE .LST uses some of these USRs to load and display a 62-sector picture.

Side 2

ATARIOIL.ARC—A demo that shows the process involved in drilling for and pumping oil. Shows how the oil is separated from gas and transported to the refinery. Very good graphics and quite educational.

NOISY.DCM—The Noisy Giant is a Micro Tales animated storybook for young children. Sound and graphics animation enhance the textual story. This one is sure to be a hit with the youngsters.

Readers can purchase these disks from their local AIM participating user group or by sending $6 ($5 +$1 s/h) per disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, or call (313) 973-8825 and have your Visa or MasterCard handy. Please specify the July '92 ST, Mac or 8-bit Disk when ordering. When ordering the Mac/Spectre Disk, please indicate Mac or Spectre format.

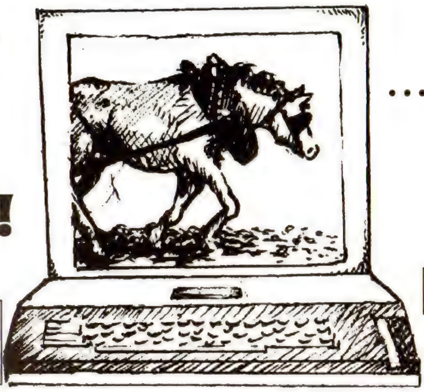
Make your 8-bit a Workhorse!



...with power products from Computer Software Services

Power Products for your XF551

$99.95 THE XF SINGLE DRIVE UPGRADE $99.95

Double the storage capacity of your XF551 with our 3.5" 720k **single drive upgrade!** Included with the upgrade is a Sony 3.5" disk drive in a 5.25" faceplate that perfectly replaces the existing 5.25" drive. The 3.5" drives are newer technology, more reliable, and easier to handle. Do NOT confuse this with public domain upgrades! The completely re-written drive OS adds these features:

- **Fixes incompatibilities** with commercial software
- **Eliminates** density **reconfiguring problems**
- Switches to second side without reconfiguring
- **Ultra Speed** I/O compatible
- Very **high speed** sector skew in US mode
- Capable of reading **IBM** and/or **ST** disks
- Compatible with 40 OR 80 track drives

Included with the upgrade is a utility program capable of reading IBM and/or ST disks, so you can import text or binary files to your 8-bit (text conversion routines are included). Minimal soldering is required; but we provide free installation for any of our products! Only $99.95 plus $8 S/H/I. If you already have a 3.5" drive, you may obtain the single drive upgrade without the Sony drive for $59.95 plus $5 S/H/I.

$139.95 THE XF DUAL DRIVE UPGRADE $139.95

Our XF Dual drive upgrade allows you to **add** a 3.5" drive to your XF551, while keeping the 5.25" mechanism. This is a totally **switchless** upgrade that turns your XF into two disk drives! The added 3.5" drive assumes the next drive number higher than the 5.25" and is totally independent, so you can copy between drives, even mixing densities! This product has all of the features of the above single drive upgrade, available for **both** drives! Complete with Sony 3.5" drive, only $139.95 plus $8 S/H/I. The upgrade without the drive is $79.95 plus $5 S/H/I. A special version to handle dual 3.5" mechanisms is available for an additional $20.

THE FLOPPY BOARD $109/149

The Floppy Board has arrived! This long-awaited Black Box add-on has been in the making for quite a while, but we've packed it with features that are worth the wait! This sophisticated device allows connection of up to four 5.25" or 3.5" floppy drives (drive sizes may be mixed). Access to these drives will be at parallel bus speed, approaching that of hard disks!

The board consists of 13 special integrated circuit chips, fully powered by the power supply of the Black Box. It has its own on-board microprocessor to take the load off the computer's processor for disk I/O. The board and fits perfectly over the Black Box (inside the custom cases!). It is not a stand-alone device; it must be used in conjunction with the Black Box.

High density disks are supported, so 1.2 meg 5.25" and 1.44 meg 3.5" drives may be connected. This is the only 8-bit controller to fully support these drives and densities! With four 3.5" 1.44 meg drives connected, you can achieve more total storage than a 5 meg hard disk! Archiver compatibility is supported! This means you can back up those titles no longer available. Although it's not as powerful as our Super Archiver, it will have the same editing power, with good backup capability.

Software included with the Floppy Board includes a utility to READ and WRITE IBM and ST disk formats! This will yield the easiest possible way to port text and data files between your 8-bit and ST or PC! This will be compatible with most all of the current formats. Also included is a high-speed sector copier designed to make extremely fast, verified copies of disks. A future upgrade to the Hard Drive Pro Backup (our hard disk backup tool) will make special use of the floppy board, and squeeze even more data on each disk than standard formats allow. It is possible to actually store 1.6 megs of data on a 1.44 meg 3.5" drive, so backing up a full 20 meg hard disks might only take 14 disks! Usage of the Floppy Board's on-board processor will allow overlapping reading and writing, making the backup really fly.

Two versions are available: the basic unit, and the Deluxe version. The basic unit provides the interface necessary for low density drives (360k for 5.25" and 720K for 3.5"), and comes with the IBM/ST transfer utility. The Deluxe version adds the high density capability, adds Archiver compatibility, AND adds the features of the Black Box Enhancer, which include a high-resolution 16 grey scale printer screen dump, and a powerful built-in sector editor, disassembler, and copier (which accesses the full 16 megs possible of hard disk partitions, and uses all available extra memory). Note: the Floppy Board replaces the ROM on the Black Box, so current Black Box Enhancers cannot be used with the Floppy Board.

The basic unit is only $109.95, and the deluxe unit is only $149.95. Add $5 for shipping/handling.

Power products for your XL/XE computer

~~$69.95~~ THE ULTRA SPEED PLUS OS ~~$69.95~~

The Operating System that should be in every XL/XE computer! The **ULTRA SPEED PLUS** puts unbelievable speed and convenience at your fingertips. After using it a while, you'll wonder how you ever got along without it! Use **ANY DOS** to place **ULTRA HIGH SPEED** formats on your disks (with XF551 or modified 1050 drives), reconfigure and boot any drive (1-9 or even your **RAMDISK!**), sector copy single and double density disks to your RAMDISK, activate a built-in **400/800 OS** for compatibility, and much more! Below are a list of features. Only $59.95 + $5 S/H/I.

- **ULTRA SPEED SIO** for most modified drives
- **ULTRA SPEED** is toggleable
- Boot directly from RAMDISK
- Special timer circuits not required for 1 and 2 megs
- Background colors adjustable
- Reverse use of **OPTION** key
- Toggle internal **BASIC**
- Built-in drive number editor (including RAMDISK drive)
- Toggle screen off for up to 40% increase in speed
- **DOUBLE DENSITY RAMDISK** handlers
- **ENTIRE MEMORY TEST** that pinpoints defective RAM chips
- Boot any drive (1-9) on cold start
- Supports ALL XE-compatible memory upgrades up to **two megabytes**
- **THREE** Operating Systems in one **(XL/XE, 400/800, ULTRA SPEED PLUS)**
- **COLD-START** without memory loss
- Built-in mini sector copier
- **RAMDISK** exactly duplicates floppy drive so sector copying and editing are possible

$199.95 THE BLACK BOX $199.95

The **BLACK BOX** is a parallel-port device for your XL or 130XE computer that adds tremendous power to your 8-bit Atari. It is a T-shaped board with two buttons, two switches, and a set of dip switches visible from the outside. The **BLACK BOX** performs three main tasks: interface to a SASI/SCSI bus (for interface to most common hard disks), a parallel printer port, and a RS232 (modem) port. You may partition your hard disk(s) into as many drives as you wish; up to 9 may be active at any given time. By pressing one of the buttons on the **BLACK BOX**, you will enter the configuration menu, where you can re-assign drive numbers, swap partitions in and out, etc. When you exit, you will be returned to your program – undisturbed! Each hard disk partition has its own write-protect flag, and may be set to single or double density. Every hard disk may be write-protected with the flip of a switch. As an option, you may use your computer's XE RAM as a printer buffer, or order the BLACK BOX with 64K of on-board RAM.Another amazing feature of the BLACK BOX is the built-in **screen dump**. By simply pressing a button, the contents of your screen will be dumped to your printer! (You can define text or graphics modes with a switch!) The RS232 port supplies the full spec signals for added compatibility. Its handler takes up no user memory, and can handle 19,200 BAUD! A **machine language monitor** has been added to allow memory disassembly, memory/register changes, and more. The basic **BLACK BOX** unit is $199.95, and $249.95 with 64K RAM (for printer spooler). S/H/I is $8. An optional custom BLACK BOX case is available for $39.95. The Black Box is a product of Computer Software Services... Not the Black Box Corporation.

HARD DISK SYSTEMS

We offer complete, ready-to-run hard disk systems from 5 megs on up! These systems include a hard disk, Black Box, power supply, controller, cables, and software. Everything is pre-formatted and tested, so all you have to do is plug it in and boot! Prices start as low as $399. Call for the latest prices and specials!

INSTALLATION AND REPAIRS

Althoough installation of any of our products is easy, by taking advantage of our free installation offer, you can rest assured it will be done right. All you pay is the freight charges.
For repair of Atari 8-bit computers and drives at reasonable rates, contact our repair department at (716) 429-5639. All work is guaranteed, and there are no minimum estimate fees.

TWO FOR ONE DEAL!

If you have two or more of the same items needing repair and don't want to spend any money... send them to us and we'll use the parts from both defective items to make one good working unit at NO CHARGE - we'll keep the other defective one for parts! Please call before sending anything in.

We carry many other items - call for our FREE catalog!

Dealer/Distributor/User Group discounts available–call for info.

We accept VISA and Master Card. NY Residents please add sales tax.

Except Artistic Talent

Didot Pro. CD combines images, line art, Type, Color, Postscript Type 1 fonts, Calamus fonts, Vector graphics, CVG, DVG, RVP, TIFF, TIC, TIH TIM, EPS, GEM, GMA, IMG, QFAX, ISH, ISS, BUT NO LSD (unless the VME MATRIX card is defective), into your comprehensive layout. Full featured page layout including built in autotracer. Fonts can be edited on the fly like any other vector object. Final screen separation, and rasterization at 2400 DPI can be done on the design platform. This enables preview of final screen on the monitor or proof printer (like an electronic loop, 300 DPI proof of a portion of the 2400 screen to maintain dot ratio), all in minutes instead of hours. Special hand opimized screens pioneered by Linotype–Hell, that are free from the usuall aboritions inhierent in postscript screening technology, are included in Didot! If you bring me a ISS file (final screen file) on your optical, 44 or 88 Meg. Syquest cartridge, We can shoot it to film on our Linotype imagesetter, and process it in house, all in minutes. One trip, one stop, final film in your hands, ready for the pressman. If you are to far away to come in, you could upload a DIP file, or output postscript for a conventional service bureau. When you grow tied of paying lots of money for 24 Hr. "rush" charges to a postscript sevice bureau, add an imagesetter to your system for complete in–house capabilities. Then you could charge others lots of money for a few minutes of computer time. We can now output Calamus files as well! The features go on and on, and more modules are added all the time. I knew all these years (13 so far) of "hanging in there" with Atari would pay off someday!

Regular Contributors
Tim Holt, Charles Kelly, Ellen Lentz

Atari Interface Magazine is a monthly publication that also serves as an official newsletter of several independent Atari user groups and is not affiliated with Atari Corp. in any way. AIM is published by Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, (313) 973-8825 voice, (313) 973-9137 BBS.

Subscriptions — A subscription to AIM is included in membership in any participating club or may be obtained directly from Unicorn Publications. See the subscription form elsewhere in this issue for rates.

Advertising — For ad rates or to request a media kit, call Patricia Snyder-Rayl at (313) 973-8825 or write to her at Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108.

Submissions — Articles/submissions for inclusion in Atari Interface can be sent on disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108. Submissions can also be uploaded to the Treasure CheST BBS at (313) 973-9137. Standard ASCII text files set block left (ragged right) with no paragraph indents and a blank line between paragraphs are preferred.

Reprints — AIM does not knowingly reprint copyrighted material without permission from the source. Non-commercial user group newsletters are granted permission to reprint articles from this magazine as long as credit is given to AIM, the author and club (if applicable).

Atari Interface is produced with an Atari TT/030, HP Laserjet II with PacificPage PostScript cartridge and Soft-Logik's PageStream.

Opinions expressed within articles in this magazine are solely the views of the author(s) and do not necessarily represent the opinions of Unicorn Publications, Atari Interface staff or any participating club.

Atari, the Fuji symbol and names of Atari computer products are trademarks of Atari Corp. Other trademarks, where used, are the property of their respective manufacturers.

Editorial Ramblings

Things have been pretty strained here at AIM headquarters. As if the last few months of missed deadlines weren't enough of a problem...

Signs of the economic recession have become all too painfully clear to us. Two of our distributors have folded up shop, owing us considerable sums of money. Enough, in fact, that this issue was held up until we got enough funds from our other distributors to pay for printing on newsprint.

Another problem we're facing is that this was the worst summer ever for most Atari developers and dealers. To make matters even worse, Atari representatives have said the Falcon 030 will NOT begin shipping in quantity until the beginning of 1993 (or by December, depending on the source). On top of that, other changes at Atari (see our article The State of Atari for details) have left dealers and developers alike feeling very cautious.

For the very first time since we've been publishing Atari Interface, a large number of companies have decided to stop all advertising until the Atari market improves.

While these setbacks are not going to kill Atari Interface, they do force us to make some temporary changes. Mainly, the next few issues will probably not be produced on a monthly basis. Some, possibly all, of these interim issues may also be printed on newsprint.

You do *not* have to worry about Atari Interface disappearing from the planet, like some of the other Atari-related publications have done. The question isn't whether or not AIM is going to still be around; the question is only how many issues will be produced until Atari begins resupplying the market with quantities of products to sell. And the answer will be determined solely by finances.

Based on our discussions with people at Atari and other personal observations, we're confident that the Atari market is going to be much stronger next year...and we plan to be there when the market takes off!

So, please bear with us for the next few months. The Atari market doesn't look like it's going to get much better until the year's end. Until then, we Atarians all have to stick together and hope for the best

Bill & Pattie Rayl

ATARI INTERFACE
VOL. 4 FALL 1992

TABLE OF CONTENTS

FEATURES

8 **Right On Target**
Dave Plotkin finishes his look at Dave Small's past and present efforts in the Atari market.

12 **BRACE Atarifest Report**
The "Lost Boys" of MGAUG show us just how dangerous (and humorous) a trip to an Atari show can be!

15 **Atari Kid's Users' Group**
A look at an innovative way in which the PACS users' group is serving their members, written by Alice Christie.

16 **TT Lust!**
Yves Pelletier of ASTMUM shares his views on the Atari TT.

19 **Atari Stockholders' Meeting**
COVER STORY
John Pilge delivers his yearly synopsis of the shareholder meeting held in Sunnyvale.

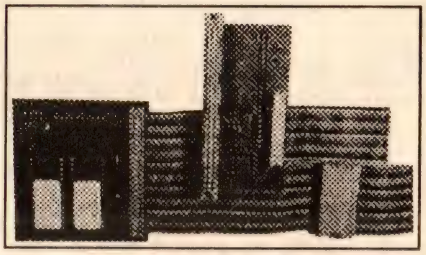
20 **The State of Atari**
Bill and Pattie Rayl discuss Atari's latest financial figures, restructuring and the Forbes article.

25 **Atari, Science Fiction and Cable TV**
An interview with Mike Kelley of SFAN reveals what this new cable TV channel offers and how Atari fits into the picture.

28 **MIDI in the Midst**
Kest Carter-Morgan gives an update on MIDI-related items seen at the Chicago Atarifest.

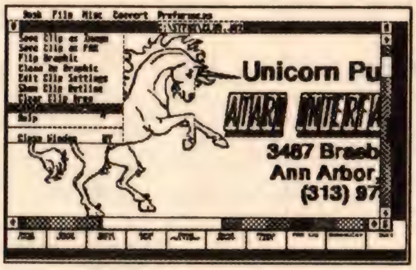
ST CONNECTION

33 **Warp 9**
The software accelerator from the CodeHeads is reviewed by Bill Rayl.



35 **TOS Extension Card**
Robert Andersen (FRAUG) reviews the Mega ST Bus Bridge version of the TEC board from CodeHead Technologies.

38 **STe Cooling Fan**
Niles Russel shows how to add a cooling fan inside your STe.



41 **STraight FAX**
The latest send and receive FAX software from Joppa is reviewed by Patricia Snyder-Rayl.

44 **Home Accounts 2**
Bill Rayl looks at this new version of an excellent home accounting package from Digita International and marketed by ABC Solutions.

8-BIT CONNECTION

48 **Why You Should Keep Your 8-Bit Atari**
Matthew Baker (AAAUA) tells us why he continues to use his 8-bit, and why you should, too.

50 **PABQWK**
The new shareware online mail reader from the author of Atari Link BBS is reviewed by Bill Mims (MACUG).

52 **1020 Printer Repair**
Alan Frazer (PACE, FL) tells how to fix a fairly common problem with this printer/plotter.

53 **The Goofy Guru**
This month, the Guru finds a use for DOS 3!

PORT CONNECTION

54 **Keeping it Organized with the Portfolio**
Marty Mankins, publisher of Take It With You, begins his regular Portfolio column with a discussion of To Do lists.

DEPARTMENTS

2 **Editorial Ramblings**
4 **Reader's Viewpoint**
6 **Bulletin Board**
56 **Disks of the Month**

All CSS products on sale until December 31!

Now $149.95! **The Multiplexer** save 25%

This device brings the power and flexibility of larger systems to your 8-bit. The Multiplexer is a collection of cartridge interface boards that allow up to 8 Ataris to read and write to the same drives (typically a hard disk), access the same printer(s), and talk to each other. It is the first practial networking system for the Atari 8-bit computer.

One "master" computer (any 8-bit) is equipped with the master Multiplexer interface. Then up to 8 "slave" computers hook up to this master, each having their own slave interface. The slave interface consists of a cartridge that plugs into the cartridge port. It has its own socket on the top, so you can use whatever cartridges you desire with the system.

The "common" peripherals (things that are to be shared) are connected to the master. On each slave, all disk and printer I/O is routed through the master, so no extra disk drives are needed. The master computer can be configured in any manner you wish. You may have certain peripherals local to the slave, or routed to a different number on the master. Note that serial ports (R: RS232 interfaces) are not multiplexed.

Under development is a BBS system that will make full use of this device, allowing up to 8 lines/users to be using the system at the same time (our BBS uses it right now)! A multi–user chat mode is a feature of this BBS; however, you do not need this program to run a BBS with the Multiplexer (but be warned that not all BBS programs will run concurrently). All slaves are independent, and do not need to have the same program running on them.

This system is excellent for BBS SysOps; you can be using your hard disk(s) while still running your BBS uninterrupted! Another example is in a classroom situation, or anywhere a disk needs to be shared by many people. This is an excellent programming / debugging tool as well!

The Multiplexer regularly sells for $199.95 for a master and two slave units with cable. Additional slave units, regularly $89.95 each, are on sale for $67.95. Shipping/handling is $5.

Now $74.95! **The XF Single Drive Upgrade** save $25

The XF551 Single Drive Upgrade for your XF551 disk drive will double your storage space to 720KB by replacing your 5.25" 360KB floppy with a new 3.5" floppy disk drive. Not to be confused with public domain upgrades, our custom chip and brain module provide true Ultra Speed compatibility (extremely fast operation with compatible sector copiers and DOSes), and eliminates incompatibilities with software. The upgrade is designed so that it will work with a 5.25" drive, should you ever need to switch back.

Included in our kit is a high quality 3.5 inch floppy drive mounted in a 5.25 inch frame, so as to provide a perfect fit inside your XF551. Also included is a program which allows you to read IBM and Atari ST disks on your converted drive! Built–in text translation is featured for easy porting of PC/ST text files into 8–bit word processors.

The XF551 Single Drive Upgrade regularly sells for $99.95 plus $8 shipping/handling. If you already have a 3.5 inch drive to use, you may order the kit minus the 3.5 inch drive for $59.95 plus $5 shipping/ handling.

Now $119.95! **The XF Dual Drive Upgrade** save $20

Our XF Dual Drive Upgrade has all the features of our XF Single Drive Upgrade, but allows you to have both your 5.25 inch 360KB floppy and a 3.5 inch 720KB floppy drive on your system. This is a totally switchless upgrade that turns one XF551 into two disk drives. Each drive acts separately, the 3.5 inch drive assuming the next drive number higher than the 5.25 inch setting. You can copy between drives, even mixing densities!

Complete with a 3.5 inch drive, the XF Dual Drive Upgrade regularly sells for $139.95 plus $8 shipping/handling. If you already have a 3.5 inch drive, you may purchase the kit minus the 3.5 inch drive for $89.95 plus $5 shipping/handling.

8-bit Repairs

Having a problem with your 8-bit equipment? CSS repairs all kinds of Atari products, from computers to disk drives. Call us to arrange shipment of your items.

If you have two of the same product and both need repair, take advantage of our **two for one** repair deal. Send both items to us, and we will fix one of them **FREE** and keep the other one for parts. Again, call us to arrange shipment.

Now $64.95! **The Bit-Writer** save 20%

The Bit–Writer is capable of duplicating even the "uncopyable" Electronic Arts and Synapse Syn–series, which employ 34 full sectors/track. These cannot be duplicated with the Super Archiver, as a standard floppy disk controller chip is simply not capable of writing what is necessary. The Bit–Writer is capable of reproducing these and future protection schemes of non-physically damaged disks, because it breaks down the data into bits, and writes it all out at once.

The Super Archiver with the Bit–Writer is the ultimate backup tool for the 1050 disk drive. Exact duplicates of originals are made. The Bit–Writer must be used with the Super Archiver. Regular price is $79.95 plus $5 shipping/handling.

Now $59.95! **The UltraSpeed Plus OS** save $10

The Operating System that should be in every XL/XE computer! The Ultra Speed Plus OS puts unbelievable speed and convenience at your fingertips. After using it a while, you'll be spoiled! Charles Cherry in the April '89 ANTIC magazine reviewed, "Quite simply, if you don't have Ultra Speed Plus, you're using a crippled Atari."

Use any DOS to place Ultra Speed formats on your disks (with XF551 or modified 1050 drives), reading and writing at this speed with most programs. This high speed mode is toggleable for maximum compatibility.

Built in RAMdisk handlers recognize any size (up to 2MB) XE–type memory upgrade. This RAM drive may be treated like a regular disk drive, capable of single or double density operation. Since the handlers are in ROM, most all programs (including sector copiers) see it. This opens up a whole new realm, as you can sector copy a disk into RAM, edit it, and even boot from it! A mini sector copier is built in for easy use.

A configuration menu is built in, and may be used to remap disk drives to respond to different drive numbers, and change the drive number of the RAMdisk. The memory test routines have been rewritten, and test ALL of the available memory. If a problem is found, the offending bit is displayed. The diagnostic ROM bit on the PIA is not needed, so all bits are available for memory upgrade use.

Several key functions have been added: a cold start key (to allow rebooting from any lockup without losing the contents of your RAMdisk), disk I/O sound toggle, screen DMA disable (turn off the screen to increase processing time of slow programs), internal BASIC toggle, keyboard lock, and screen color toggle. The OPTION key is reversed when booting, so you don't need to hold it to run ML programs.

The Ultra Speed Plus OS module actually contains three operating systems: the Ultra Speed Plus OS, the standard XL/XE OS, and the XL Fix Plus OS. The XL Fix Plus is a 400/800 OS translator in ROM, so you won't have to boot a translator disk again! It has two modes of operation for maximum compatibility.

Four simple solder connections are required for installation if your machine has a socketed OS ROM. If it does not have sockets, installation should be done by someone proficient in desoldering. As always, we provide free installation if you send us your computer. Regular price is $69.95 plus $5 shipping/handling.

Ordering Information

Call CSS at (716) 429-5639 between 10am and 5pm Eastern Time to order, or send your order to the address below. CSS accepts payments in cash, money order, Visa, MasterCard, or COD. Personal checks are also accepted, but shipment of your product is delayed until the check has cleared. Canadian orders must be paid for in US funds. Prices in this ad effective until December 31, 1992 only.

Call or write for our free catalog of products. CSS also has a free catalog of pre-owned software, Atari related books, and owner's manuals for most hardware products.

Computer Software Services, Inc.
PO Box 17660

Developing products exclusively for the Atari 8-bit since 1982!

Take advantage of CSS' first holiday sale!

Now $179.95! The Black Box save $20

The Black Box is an add-on board for the Atari 600XL (upgraded), 800XL, and 130XE computers. The Black Box provides many unique and useful functions.

The RS-232 port emulates the Atari 850 interface very closely, but goes beyond by providing 19,200 baud capability. The Black Box is the only interface to support **hardware flow control**. This enables owners of high speed modems (4800 baud and up) to use their modem at full speed, and not worry about data loss due to a slow BBS or terminal program.

The parallel printer port interfaces to most all Centronics-type printers. You may assign the printer number and line feed options from within the Black Box's configuration menu. The Black Box allows **buffering** of your data, either using the extra 64K in your 130XE or the optional 64K RAM in the Black Box itself.

The hard disk port was the real reason for the design of the Black Box. You may connect most any hard disk controller that is SASI or SCSI compatible, or drives with embedded SCSI controllers. It is totally compatible with the current versions of MYDOS and SpartaDOS. The Black Box allows you to have up to 96 partitions with names, and set any partition as any drive (D1: through D9:), allowing you to place unprotected single density boot programs on your hard disk. You may also write protect ALL of your hard disks with the flip of a switch.

The Black Box also provides support for users who have previously used an ICD MIO to store data on a hard disk. You can have compatibility with an MIO formatted hard disk by simply setting a dip switch.

The 6502 monitor is very handy for machine language programmers. How often have you wondered where your program was, or what caused an apparent "lockup"? Entering the monitor will show you all the processor registers, and display the disassembly of the instruction it was about to execute when you pressed the button.

A printer dump of your current screen may be done at any time by pressing one of the buttons on the Black Box. A switch allows you to choose either text or graphics dump. (The graphics dump is only available for dot matrix printers capable of graphics.)

CSS sells a variety of accessories for your Black Box. The **Black Box Case** is a durable black plastic housing for your Black Box which sells for $39.95. **Modem and printer cables** are available for $9.95 each.

The Black Box regularly sells for $199.95 plus $8 shipping and handling. The Black Box with a 64K printer spooler regularly sells for $249.95 plus $8 shipping and handling.

Now $134.95! The Floppy Board save $15

Our latest and greatest product! The Floppy Board is an add-on expansion board for the Black Box interface. It allows the user to add up to 4 inexpensive, "standard" floppy drive mechanisms. The Floppy Board supports almost all floppy drive configurations, including 360kB, 720kB, 1.2MB, and 1.44MB. Built-in the Floppy Board are the Black Box Enhancer and a version of our Super Archiver.

Disks formatted on the Floppy Board are accessed at parallel bus speeds, providing a **substantial** performance increase over the standard serial Atari floppy drive. In fact, Floppy Board drive access is much closer to hard drive speeds than to standard serial drives! Included with the Floppy Board is our **IBM/ST Disk Transfer Utility** program, which allows you to both read and write IBM or ST disks. This makes the Floppy Board the ideal method for porting files to and from your PC or ST!

Also available for your Floppy Board is our 1.44MB drive kit. The kit includes a high-quality 1.44MB drive mechanism, power supply, and floppy drive cable, and sells for only $79.95 plus $8 shipping and handling. The Floppy Board regularly sells for $149.95 plus $5 shipping and handling. CSS also sells power supplies, floppy drive mechs, and custom floppy drive cables. Call for pricing.

Now $79.95! The Super Archiver II save $20

The Super Archiver II edits and copies all enhanced density programs plus retains all the features of our Super Archiver. This allows you to copy or create single or enhanced density protection schemes (including "phantom" sectors). It is completely automatic and compatible with the Super Archiver, a truly powerful backup and programming device.

Only $99.95 plus $5 shipping/handling. If you already own a Super Archiver, you may upgrade to a Super Archiver II for only $29.95 plus $5 shipping/ handling (disk upgrade; no additional hardware required).

Now $39.95! The Black Box Enhancer save 20%

A must for all Black Box owners! The Black Box Enhancer is a plug-in module for your Black Box, enhancing the printer functions and adding an instantly available, full featured **sector editor**!

The built-in **screen dump to printer function** will now render a hardcopy with a 16 shade grey scale representation of the colors. A special graphics printer handler is built-in, which allows any output directed to P9: to be printed on your graphics compatible printer with the same character font used on your computer. This means all the Atari special control and graphics characters will be printed, along with inverse.

The built-in Task Master sector editor is the most powerful editor for the 8-bit. It contains a sector copier featuring multiple copies, automatic formatting, and uses all available memory for fast disk duplication. The Task Master is not limited to only floppy disks. It can handle up to 16 megabyte hard disk partitions (even in the sector copier mode)! The Task Master provides full DOS support for MYDOS, SpartaDOS, and Atari DOS derivatives. Subdirectories are fully supported! You may link through individual files by simply moving through the directory and highlighting the file you wish to edit. 16-bit and sector map linking are supported for hard disks, and 11-bit linking for floppies. It is ideal for quickly editing files and repairing damaged directories.

The Black Box Enhancer regularly sells for $49.95 plus $5 shipping and handling.

Now $59.95! The Super Archiver save 15%

The Super Archiver is not just another double density high speed upgrade. Rather, it is the most powerful copying and disk editing tool available! Copies of disks are exact duplicates of originals, eliminating the need for patches, PDB files, extra computer hardware, etc. The Super Archiver is the fastest non-buffered upgrade for the 1050 drive.

Once installed, your drive has the ability to perform in all three densities, reconfiguring automatically as needed. But unlike some upgrades, 100% compatibility is maintained, so you will be able to boot any disk regardless of the protection. The software provided enables sophisticated editing of single density disks. Ultra Speed data transfer is fully implemented, so programs and hardware modifications supporting this will really take off. The Black Box and the UltraSpeed Plus OS also support this.

The Super Archiver is fully compatible with the older Archiver for the 810 drive, but comes complete with more powerful software that makes use of the 1050's extended capabilities. You may use an Archiver 810 drive for two drive backups.

The Super Archiver software is more than just a backup program. It enables the user to actually edit each sector (with ML disassembly), modify the sector layout on each track, and create your own bad sectors and other forms of protection. The Super Archiver is the only modification that will reproduce "phantom" sectors. The software included will duplicate these automatically, as well as let you write your own. Extra memory is supported for single pass copies. Track skewing (aligning each track in a certain order) is supported, as well as automatic speed compensation required to write out long tracks.

Included on the disk are other useful utility and diagnostic programs. The Mapper allows tracing the loading of a program within the drive. The Super Archiver utilities are all designed with simplicity in mind, yet with enough power for whatever you need. The only programs we know that cannot be duplicated are the later Electronic Arts programs and Synapse Syn-series (34 FULL sectors/track). However, we do have a fix for this! (See the Bit-Writer.)

Disks should only be copied to back-up your original program disks! CSS in no way supports the misuse of this product as a pirating device. The Super Archiver regularly sells for $69.95 plus $5 shipping/handling.

Now $34.95! The XF551 Update NEW ITEM!

The XF551 Update is a completely new internal operating system for your XF551 drive that fixes the quirks and bugs inherent in the XF551 design. It runs more commercial software, changes density properly, supports true Ultra Speed data transfer (actually, faster than the 1050 Ultra Speed), and has an optimized interleave in high speed formats to produce the fastest possible operation. It is the upgrade every XF551 owner should have!

Installation requires only a few simple solder connections. The introductory price for this new product is only $34.95 plus $5 shipping/handling.

Call or write for our free 1993 catalog!

ATARI BULLETIN BOARD

040 Upgrade?

At the recent Messe in Germany, the Markt & Technik booth displayed a Mega4 with a 68040 expansion board mounted in a mini-Tower case. The 68040 CPU was running at 60MHz internally and 30MHz externally. Also onboard was 8 MB of "Fast RAM." Price for the upgrade, which was not yet available for purchase, was expected to be around DM 3000,- (approx. $2000 US). Markt & Technik, Hans Pinsel Str. 2, 8013 Haar b. MÜnchen, Germany.

TT Virtual Memory

If you have a TT and want to *really* upgrade your system's memory, there are a couple of options from Germany that might interest you. Maxon Computer GmbH sells a package called Outside allowing up to 128MB of virtual memory without hardware modification. You must, however, have a machine with TT Fast RAM. Price is DM 99 (approx. $60 US). Maxon Computer GmbH, Schwalbacher Str. 52, W-6236 Eschborn, Germany.

If that's not enough memory for you, OverScan GbR has VRAM, which supports up to 2GB (gigabytes) of virtual memory! The software supports any TT with Fast RAM or an upgraded ST with 68030, TOS 2.05 or above and Fast RAM. Price is DM 149,- (approx. $90 US). OverScan GbR, Santisstr. 166, W-1000 Berlin 48, Germany.

PMC

Purple Mountain Computers (PMC), distributor of Darek Mihocka's Gemulator, has announced the ST emulator for IBMs is now shipping. The package, which includes Gemulator board and TOS 2.06 ROMs is only $299. The Gemulator software is being released as Shareware to keep the hardware price down.

PMC also announced availability of their Freedom Floptical Drive, the first low cost 21MB floptical drive available for the ST. The Freedom drive also reads standard 720K and 1.44MB 3.5" floppies. The drive package includes one 3.5" 21MB disk and ICD Link adaptor for a limited time introductory price of only $399. PMC, Inc., 15600 NE 8th St., Ste. A3-412, Bellevue, WA 98008, phone: (206) 747-1519.

STorm

Double Click Software has announced that a new telecommunications package written by Alan Page (author of the original Flash!) is now in the works. The new program is called STorm and boasts such features as a modular design, internal multitasking, resizable GEM window editor allowing multiple files to be open at the same time, and a multitasking full BASIC interpreter for writing script files! Double Click Software, PO Box 741206, Houston, TX 77274-1206, phone: (713) 977-6520 (noon-6pm).

Warp 9 Upgrade

CodeHead Technologies released version 3.71 of their Warp 9 software accelerator. The newest feature is the Extend-O-Save modular screensaver. The screensaver allows external modules to vary the graphics displayed on-screen, similar to commercial packages for the IBM and Mac. Owners of previous Warp 9 versions can upgrade for $15. Retail price of Warp 9 is $44.95. CodeHead Technologies, PO Box 74090, Los Angeles, CA 90004, phone: (213) 386-5735 (Mon-Fri 9AM-1PM PT), FAX: (213) 386-5789.

MacSEE

Compu-Seller West and Reeve Soft are now shipping MacSEE, a program allowing ST owners to directly read from and write to Macintosh HFS or Spectre formatted disks, including 1.44MB disks and SyQuest cartridges. Options include transferring files using MacBinary (for programs) and translation (for text, etc.). Retail price is $59.99. Compu-Seller West, 220 1/2 W. Main St., St. Charles, IL 60174, phone: 708-513-5220.

Spelling Sentry

Wintertree Software has announced Spelling Sentry, a desk accessory that adds spell-checking and abbreviation expansion ability to any GEM program. The software supports a main dictionary of over 100,000 words and a user dictionary for personal or technical terms. Retail price is $59.95. Wintertree Software, Inc., 43 Rueter St., Nepean, Ontario K2J 3Z9, CANADA, phone: (613) 825-6271.

E.Z. Arithmetic

A series of 12 modules covering whole numbers, bases, fractions, decimals, measurements, percentages and more is now available from E.Z. Software. The modules are designed to make it easy for anyone, from grade school and up, learn or review in all aspects of arithmetic. Each module retails for

$49.95 and is available for the Atari ST/MEga/TT, Amiga, Apple, Macintosh, IBM and HP 95LX palmtop. E.Z. Software, PO Box 500, Midwood Station, Brooklyn, NY 11230.

Microdeal News

Microdeal has released Replay 16, the first 16-bit sound sampler for the ST. The cartridge and software is capable of converting between any 8-, 12-, or 16-bit AVR sound sample in either mono or stereo at up to 48KHz, which is better than CD quality! Included in the package is Drumbeat, a 4-voice polyphonic drum machine and MIDIplay, a MIDI keyboard emulator supporting up to 128 samples in memory. One meg of memory is recommended. Retail price is £129.95.

If you're looking for quality 8-bit sound sampling, Stereo Replay can convert 12- and 16-bit samples to 8-bit mono or stereo and includes a 3-channel drum sequencer. Retail is £89.95. And, for the user on a strict budget. The package lets you create and record stereo samples for only £39.95.

If you're into MIDI music, Microdeal has recently released Concerto, a low-cost, powerful 24-track MIDI sequencer with many features found only in packages that cost over twice the price. Retail price is £39.95. Microdeal Ltd., PO Box 68, St. Austell, Cornwall, PL25 4YB, England, phone: (0726) 69692, FAX: (0726) 68020.

CyberDrome

Fair Dinkum is now shipping CyberDrome—The Hoverjet Simulator, a "3-D virtual reality arcade simulation" by RHEA-FX. The game offers a single player mode or a 2-player/2-computer mode via modem or serial cable. Also included is a special 2-player Head-to-Head competition mode. Six mission levels are included, with plans to release additional mission disks in the near future. Requires 1MB of RAM and color monitor. Versions for the IBM and Amiga are under development and will be able to link with the Atari version for modem-to-modem play. Retail price is $39.95. Fair Dinkum Technologies, PO Box 2, Los Alamos, NM 87544, phone: (505) 662-7236.

HyperLINK Runtime Package

JMG Software has announced release of the HyperLINK Runtime Package for FREE distribution by users' group, online services and users. HyperLINK is the leading "Application Generator" product for the ST/TT. The Runtime Package will allow HyperLINK owners to create their own standalone programs that other ST owners can use without owning HyperLINK. The full HyperLINK package, with Application Builder, Report Generator and additional modules retails for $149. JMG Software, 892 Upper James Street, Hamilton, Ontario L9C 3A5, CANADA, phone: (416) 575-3201, FAX: (416) 5759-0283.

Atari Classics Debuts

The premiere issue of Atari Classics, a new magazine for Atari 8-bit owners, is expected to be available at the WAACE show (October 10&11). The first issue will be shipped *free* of charge to all persons who responded to the Atari Classics write-in campaign and will also be given out to WAACE show attendees. Annual subscription rates are $25 per year for the magazine (6 issues) and an additional $9 for the three Classics disks. Atari Classics, ATTN: Managing Editor Ben Poehland, 179 Sproul Road/Rt. 352, Frazer, PA 19355.

Quick

A programming language for the 8-bit called Quick has been gaining a devoted following in Germany. The disk-based environment includes a machine-language compiler. Retail price is DM 39,- (approx. $26 US). For orders outside of Germany, add DM 10,- for shipping. A disk-based magazine covering programming in Quick (written in German) is also available for DM 9,-. Power per Post, Postfach 1640, W-7518 Bretten, Germany, phone: (0)7252/3058, FAX: (0)7252/85565.

Atari Explorer Drops the 8-Bit

The new staff at Atari Explorer has announced they will no longer support the 8-bit computer line. Mike Lindsay, Explorer's new editor states this policy was necessary due to the new limited issue size and budget allowed by Atari.

Portfolio News

Megabyte of Hurst, Texas, now modifies the Serial Interface to include an internal Practical Peripherals Pocket modem. This gives you an all-in-one, direct connect modem for the Portfolio, eliminating the need for a serial cable. Cost for the modification is $50, excluding interface and modem. Call Megabyte at (817) 589-2950 for details.

Optrol, Inc. has announced the availability of 1, 2 and 4MB Flash Memory cards that fit inside the Portfolio's memory card slot. List price is $179, $254 and $399, respectively. Optrol Inc., PO Box 37157, Raleigh, NC 27627, phone: 919-779-3377.

Re:Port, a Portfolio-specific newsletter, has a new address. A subscription to the newsletter with disk and $5 gift certificate costs $50. As a subscriber, you also get to take advantage of Re:Port's special pricing on Portfolio hardware and software. Re:Port newsletter, c/o Editor David E. Stewart, 806 Benton Dr. #34, Iowa City, IA 52246-5207, phone (319) 354-7995.

E.Z. Arithmetic

A comprehensive course for students, parents and adults

- Learn, relearn, review or drill all aspects of arithmetic
- Easy to use manual and user-friendly software
- Amiga, Atari ST, Apple, HP 48, HP 95, IBM, Mac, TI-85 versions
- Concepts, definitions, methods, terminology fully explained and illustrated with lots of model problems and exercises
- Includes detailed arithmetic course outline

For complete information, write

E.Z. Software, Dept AIM1, P.O. Box 500, Midwood Station, Brooklyn, NY 11230

Right On Target

Dave Plotkin

When I first found out Dave was going to build the "ultimate" accelerator based on Motorola's most advanced (at the time) chip, I can't say I was too surprised.

Last issue, we were talking about Dave Small's original Macintosh emulator, the Magic Sac. This little wonder used genuine 64K Mac ROMs and could emulate the Macs that were based on these same ROMs.

As Apple increased the power of the Mac line, they found they needed more space in the ROMs. Thus, they brought out new Macs that were equipped with 128K ROMs. In fact, the actual Apple ROMs that Atari owners bought from Apple dealers to use with Magic Sac came from Macs that had the 64K-to-128K ROM upgrade performed.

Predictably, as the new Macs gained popularity and Mac owners rushed to have their Macs upgraded, the number of software programs that required the 128K ROMs mushroomed, leaving Magic Sac owners out in the cold.

Something else happened about this time too—something that helped to catalyze the development of a new product that could work with 128K ROMs and run the new software. Dave had a falling out with Data Pacific, and subsequently left the company. The company survived for awhile, selling Magic Sacs, and there were some ugly lawsuits (I don't know the outcomes). But, after a bit, Data Pacific disappeared in the mists that have swallowed up many an Atari vendor.

A Spectre Rises

As you know, though, Dave Small did not disappear. He began work on the new product—Spectre 128. It was named that because he envisioned it as rising from the ashes of Magic Sac and Data Pacific.

Spectre was designed to work much like Magic Sac—plug it into the cartridge port, run the driver software, and voilà! Instant Macintosh.

As Dave once told me, Spectre was roughly twice as much work as Magic Sac—because he had to disassemble the 128K ROMs (which were twice as large as the original 64K ROMs) and study them to figure out how to make his software work.

But Dave is nothing if not persevering. He brought out the first Spectre, a small cartridge that worked like a champ. It worked wonderfully well and ran most Mac software. And, with each new release, it got better. Dave added sound support along the way—something he had once declared impossible. He also added support for directly reading Mac disks with a new version of the product called Spectre GCR (GCR is the encoding scheme that Apple uses for Mac disks). This eliminated the need for converting Mac format disks to special Spectre format before using the disks on an Atari.

Dave had pulled this direct-GCR-reading trick before with the original Magic Sac and a device called the "Translator." He worked very long and hard on the Translator, and the result was a rather large box that plugged into the MIDI ports on the ST. It had its own microprocessor and cost around $300 (whew).

With Spectre GCR, however, the result was quite a bit better. The new cartridge was quite large, but still a cartridge—and it didn't tie up the MIDI ports. Gadgets by Small even allowed a generous trade-in allowance on original Spectres for people trading up to the GCR.

SST

Which brings us to the SST. When I first found out Dave was going to build the "ultimate" accelerator based on Motorola's most advanced (at the time) chip, I can't say I was too surprised. I saw an early version at a Glendale show and even wrote about it based on the prototype.

Dave seemed to be making good progress, but there were some design changes, and the project ended up taking much longer than anyone expected. In fact, it took so long that a competing accelerator, also based on the 68030 was announced from Jim Allen's company, Fast Technology. (Don't ask me which one is better—I don't own either one yet).

As with most of Gadgets by Small's products, the SST is elegant and addresses a host of issues. Atari did a lot of things with the ST that were designed to cut costs—but these also made it very difficult to get a lot of speed from the machines. Dave (and Jim too, from what I understand) did a lot of creative things to solve these problems. Thus, today, you can buy an accelerator for your ST that is as fast as or faster than anything Atari makes—including the TT.

Dave Small is about as famous as anyone gets who works only in the Atari world, but he himself gives the biggest share of the credit to his wife, Sandy. Sandy is a remarkable businesswoman who is managing to raise three children and manage a thriving company.

She is the president of Gadgets by Small, and she is the one you need to talk to when you want to do business with them. You can see her at the Gadgets booth at most Atari shows. I even got a button once that proclaimed that I had met her (though in fact, at the time, I had not!).

Next time, we'll talk about some of my own programming experiences with our favorite computer. 'Til then—keep your feathers dry.

Introducing: *Diamond Edge!* *Also new:* *UVK!*

**Let Diamond Back II save your data,
Let Diamond Edge Save Your Neck!**

The most advanced set of Disk Management Tools available for your Atari ST: Disk Diagnostics and Data Recovery, Complete Undelete, File Validation and Repair, Data Protection, Disk Optimization, Bad Sector Mapping, Hard Disk Partitioning, Disk Information Archival, Editing, and Restoration, and More!

Diamond Edge defines the new state of the art in disk management, optimization, and data recovery software for the Atari ST. At the special Introductory price of only $69.95, Diamond Edge is less than 1/2 the price of comparable disk management software for the PC or Macintosh. It's simply the best protection that you can buy for your disks and data.

Proudly Presented by Oregon Research Associates,
On the cutting Edge of Computer Technology!

Diamond Back II Owners Call for a Specical Limited Time Offer!!!

A full featured demo is available by sending $10(applicable towards purchase) to:

16200 S.W. Pacific Hwy., Suite 162
Tigard, OR 97224
Phone: (503) 620-4919 FAX: (503) 639-6182

Complete your total disk protection with

The Ultimate Virus Killer!

Recognizes and kills every known ST virus including the dreaded link viruses that reside within programs. Can even detect and kill unknown viruses and immunize your disks against future virus attacks. Recognizes over 1000 boot sectors and can repair over 500 benign executable boot sectors. Available now for the special introductory price of only $29.95

- Backup
- Optimization

The Mother of All Journeys

or

The Lost Boys of MGAUG Set Out for The BRACE Atarifest

Lee Benjamin,
Van Johnson
and
Jeff Vincent
MGAUG

On July 17th, three members of MGAUG began what was destined to be a truly momentous journey. The plan was to meet at a Macon, Georgia, Racetrac gas station and proceed to Asheville, North Carolina. This would not seem too difficult for an employee of TRW, a hopeful soon-to-be college student and the club president.

Alas, simply being in the same place at the same time was too daunting a task for our intrepid adventurers. Jeff and Van showed up at their destinations right on time. Sadly, their destinations had the same name but not the same location.

Being at nearly opposite ends of Macon, Lee mounted a rescue, thus allowing everyone to leave at the same time, though not nearly on time. After an intense meeting, we managed to leave at 1:30 in the morning. (Please note: we were supposed to have met at the Racetrac at 11:45 and left around midnight...).

A peaceful trip ensued, filled with the sounds of our president's snores and our sudden, uncontrollable bursts of hilarity. A good sense of humor would prove to be most useful, as we would soon find out.

At approximately 3:00 in the morning, Lee's golden chariot began giving us an astoundingly bright light show accompanied by the most fascinating of sound effects. If you have ever been downed by an undetected SAM in Falcon, you know how we felt.

At 3:15 am, a quart of oil was poured down the noble beast's throat. Fifteen minutes after that, we were walking down a dark road in Athens, Georgia. The noble stallion which had borne us through so much was no more.

Failure of the oil pump had, unbeknownst to us, dealt the fatal blow to our trusted steed. This had actually happened in Watkinsville, but Lee managed to nurse it into Athens, in the general direction of the airport.

Conventional wisdom says that an Airport will have both telephones and car rental agencies. Although this is true, even in Athens, Georgia, it is not true at 3:30 in the morning.

After Jeff's rude awakening to our situation, he and Van got to push the car to the crest of the bridge that it had almost reached. We then decided to try to walk to the Airport.

Luckily, we had broken down in a part of town which had the dubious advantage of needing frequent police patrols. We had walked just far enough to be out of sight of the car when Officer Joe Williams of the Clarke County Sheriff's Department came to our aid.

Officer Joe not only stopped, he also called for a wrecker and waited with us until it arrived. After looking us over, he decided that Jeff and Van belonged in the back of the car, behind the plexiglass and steel barrier.

After the wrecker departed with the carcass, Officer Joe helped us confirm that nothing would be open at the airport, and there were no other car rental agencies open at this hour.

We thus decided to wait for dawn at the ubiquitous Waffle House.

Upon our arrival at the Waffle House, and extended consideration, Van and Jeff were released from the car.

Our home for the next six hours provided the two essentials of life: companionship and coffee.

We consumed enough coffee to drive the profit margin down to an all time low for a regular business day. Seeing as our luck was consistently bad, we decided to ask one of the Waffle House staff for a lift to the airport.

The first person we asked for a ride was a young fellow properly attired in the brown and yellow uniform of the Elite Waffle SS, complete with paper hat. His hair style and proper speech betrayed him as a student of the University of Georgia. He looked at us as if we had just asked him for a harem of dancing Iraqis and said "Um, I uh, um, will ask the manager if we can do anything like that."

Already knowing the answer, he returned to us with a look of feigned sadness and told us that employees cannot leave the store while on duty. We must note here that the fatigue factor had been working upon the three of us for quite a while now.

We were, at times, overcome by fatigue induced cackles between coffee gulps and longing stares at any functioning automobile that drove up in the parking lot.

Apparently the management observed our appearance (complete with all of our luggage packed below our feet in the booth) and our behaviour, and they decided they would make arrangements to *get us out of there.*

So, Van removed the straws from his nostrils and Lee and I slowed our cackling long enough to bestow many thanks to the lady that was to take us to the airport. The Waffle House had had enough of the *Lost Boys of the Middle Georgia Atari User Group.*

By ten o'clock that morning we were in a rental car, speeding towards the Blue Ridge Atarifest, which had already opened. Truthfully, there was a small cloud of doom above our heads as we realized we would not be getting the "pick of the litter" by being there at opening time. We arrived in Asheville by twelve thirty that afternoon.

As there will undoubtedly be other articles written about this great Atarifest, suffice it to say that we attended the show, checked into a motel and spruced up a bit, then headed for the banquet at the Pisgah View Ranch. The banquet was hosted by Sheldon Winick, owner of the Computer STudio. We also had the pleasure of dining with the Winicks.

Being that this was an all-you-can-eat banquet, we did just that. No doubt we left a lasting impression upon the Winick family, for one of us ate like he was at home and it was not a pretty sight. (We shall not mention Jeff's name here for he is the club President, after all.) It should be noted here that the unmentioned person does not eat until he gets full, he eats until he gets tired.

We finished supper and headed back to our motel. There was live entertainment after supper, but we had not been asleep in close to 48 hours by this time.

Thankfully, the trip home was uneventful. At this point, the reader might ask, "Was it worth it?" Other than the $$$$ it took to get Lee's transportation up to par again, we had a ball!

The BRACE Atarifest was very enjoyable! Hopefully the MGAUG will have members in attendance annually.

Did I say that the trip home was uneventful? There was one small incident where Lee suffered a flashback and began to pull into a Waffle House parking lot. "Let's go get coffee," he said.

That's when we put our hands on our knives...

ANNOUNCING

THE

ATARI
SAFARI
92

Bob Brodie, Dealers, Developers, 10 am til 5 pm.

The Houston Atari Computer Enthusiasts, HACE, is sponsoring its third annual computer show.

OCT. 24, 1992 in HOUSTON, TX at the MARRIOTT ASTRODOME.

Call Harold Gailey, @ (713) 988-4772, or Bill Kithas @ (713) 855-0815 for details.

New! 88 Meg Syquest Removable SCSI Media System for TT030 & Falcon

$789.00 incl. platter

why settle for anything less ...

computer studio *file*

Case measures 6.9" x 6.0" x 10.5" and is color matched to Atari's TT030 (light beige). Assembly includes case with 50W power supply, power switch, LED power light, fan, removable power cord, two half height 5.25" drive bays, internal SCSI cable with two 50 pin drive connectors and two external 50 pin Centronics connectors.

Other sizes also available. Call for pricing.

Case alone (as described at right)	$119.00
Case with ICD AdSCSI Installed (complete with DMA cable and software - ready for installation of your hard drives	$239.00

Complete ST Systems:

with case, cables and ICD AdSCSI

50 Mb Hard Drive System (3.5")	$419.00
105 Mb Hard Drive System (3.5")	$579.00
Syquest 44 Mb Removable System	$649.00
Syquest 88 Mb Removable System	$849.00

(ALL SYQUEST SYSTEMS INCLUDE ONE DRIVE PLATTER)

TT030 & Falcon SCSI Systems:

For use with ST/STe/Mega Systems add an ICD Link adapter. Order appropriate SCSI Cable for use with TT030 or Falcon, and/or LINK Adapter and ACSI (DMA) Cable for use with ST/STe/MegaSTe

50 Mb SCSI Hard Drive System (3.5")	$359.00
105 Mb SCSI Hard Drive System (3.5")	$519.00
Syquest 44 Mb SCSI Removable System	$559.00
Syquest 88 Mb SCSI Removable System	$789.00

Accessories:

Atari TT030 SCSI Cable	$18.00
Atari Falcon SCSI Cable	$18.00
ICD LINK Adapter *(to connect a SCSI System to an ST/STe)*	$99.00
ACSI (DMA) Cable *(Required with above LINK Adapter)*	$24.95
44Mb Removable Platter	$89.95
88Mb Removable Platter	$149.95

Other sizes and combinations also available !

Atari Kid's Users' Group

[Ed: This is our first in what will hopefully become a series of looks at innovative ways in which Atari users' groups are serving their members and communities. If you have a local users' group doing something special or going 'beyond the call of duty', please write to us or send us an article telling our readers all about it.]

Alice Christie
PACS

Though some people feel that the 8-bit computers are dead, we are sure they have a lot of life left in them. This is because of the enthusiasm and interest displayed by the newest SIG (Special Interest Group) at the Philadelphia Area Computer Society (PACS).

Jessica Cavanagh is President of the Atari Kid's SIG which meets at Drexel University on the third Saturday of each month, along with the adult SIG, at 10 AM for the ST and 11 AM for the 8-bit Atari in Room M11B.

We are quite proud of our youngest SIG Leader and hope Jessica keeps on enjoying using her Atari computers and helping others to learn how to use them, too. We are not sure, but we have been told she is the youngest computer teacher and users' group organizer. Due to her enthusiasm, the Atari SIGs have been growing with the addition of both new adult and Kid SIG members.

Jessica is eight years old and has been running her Atari group for five months now. She holds meetings during the month at her home where she helps the younger members (ages 5 and 6) use the Atari 400 and 800XL. Her group has a newsletter which they put out each month using "The Newsroom;" Amanda Collins (age 11) is the Editor, and she helps Jessica with the typing.

The newest member of the group is Vicki Sakers (age 12), who has taken on the job of Disk Librarian. Jessica and Vicki picked the program "Atari OIL" from the AIM disk of the month to show for PACS Family Day on August 15.

Jessica also wrote two programs in BASIC to show how easy it is to program on the Atari with the built-in Editor—even for a girl who has just completed first grade. One was a Guess a Number game and the other was Guess a Word (five letters). A printout of the programs were included in the Kid SIG newsletter which was given out at the meeting so the others could follow along.

Last month, Jessica and Amanda ran a class on floppy disks using a poster they made showing the inside of a disk to explain why you should not touch the exposed part. When they are at PACS, the members of the Kid SIG attend the 8-bit and ST meetings and use both machines. Jessica wrote up a review of her favorite ST game "Maniac Mansion" in the Kid SIG newsletter for July, giving hints on how to get into the secret lab without blowing up.

The Family Day meeting was completely given over to Jessica and her group to run, and they were very successful. Some of the things they had planned, along with the software demonstrations, were giving out free gifts to all the kids who attended (jump ropes and trading cards), raffling off an Atari 400 with tape drive, cassette programs and BASIC cartridge and giving away software door prizes which the adult members had donated.

The meeting ran from 11 AM to 1 PM without a dull moment. Three computers were running the entire time and the kids took turns using them. The time just flew by, and before we knew it was time to pack up.

TT Lust!

Yves Pelletier
ASTMUM

I have owned an Atari 520STFM since 1986, but, in the spring of 1990, I realized it wasn't enough. I needed more memory and greater speed. I wanted the hours that I spent on the computer to pay bigger dividends than just entertainment and communications. It also seemed that my wife, who is a graphic artist, would sooner or later need a home computer powerful enough to assist her in her line of work.

At about that time, Atari was just coming out with a hot new computer called the TT/030. It seemed to me that this computer would be just the ticket for the scientific and DTP applications I wanted to explore. Wanting a TT was one thing; obtaining one was another. But, the seeds of TT Lust had been sown in my mind.

A career move landed me in Gander, Newfoundland. Gander's long-ish winter makes it a great place for spending a lot of time on a computer. Time passed...

Ordering the TT

Then, during a summer trip to the province's capital, St. John's, I noticed a cluster of STEs in the storefront window of Hutton's Music. John Hutton and his staff were very helpful and enthusiastic. We went over my wish-list and determined what the best initial set up would be. Then, John promptly placed my order, which included a TT, an Atari SLM605 laser printer and Calamus.

Time passed, and by late August, we were both pretty frustrated. I was just about to give up when Atari Canada came through in the nick of time. Finally, an Atari representative FAXed me a note saying my TT was on its way. Mr. Geoff Earle, General Manager of Atari Canada, generously relinquished two megs of RAM from his own computer so that mine could be delivered as ordered.

My TT has lived up to all my expectations, and it is a pleasure to use. The speed comes in handy, especially when using demanding applications like Calamus SL. In fact, Calamus and the TT get along very well, each one showing off the other's strong points.

Unix on the Atari

Many ST/TT programmers and power users also know a few UNIX tricks, and some have tried, in true hacker fashion, to re-create a UNIX-like environment under TOS. This is usually fragmented and piecemeal because it is built upon dozens of shareware, freeware and PD programs scattered over many BBSes and electronic information services.

These attempts should not be confused with the actual UNIX system Atari supplied to TT developers over a year ago, and which, at this writing, consumers are still waiting for. In the meantime, there is a wide selection of UNIX-style command shells and other programs that I have used to learn UNIX concepts.

Until very recently, TOS did not allow UNIX-style multitasking. But other basic UNIX concepts, such as input/output redirection and environment variables, could readily be learned with wonderful programs such as the Gulam shell and Sozobon C. What I learned that way proved very valuable when my employer started to look for people who could work in a UNIX environment.

Mac Emulation on the TT

I have added Spectre GCR to my TT, but not without a few problems at first. They were remedied, for the most part, by following George Richardson's hardware modification instructions (AIM, April '92, page 52). Unfortunately, my internal disk drive still isn't 100 percent reliable in Mac mode. I finally licked the TT/GCR problem by adding an Atari SF314 external floppy drive to the system.

Also, the current version of Spectre does not take advantage of the TT's built-in SCSI port and requires the old-style hard drive. But, having a working "Mac TT" on my desk makes up for a lot of annoyances. I like to think that Spectre GCR turns my TT into the equivalent of a Mac Plus with a 68030/68882 accelerator.

Laser-quality printing, using the Atari Laser printer and Spectre, still looks like a virtual impossibility, but a GEnie "thread" on that topic left me with the hope that a solution is not too distant.

Running Old Favorites

The TT is not intended to be a game computer (but then, neither was the ST). Its speed makes it virtually impossible to play many action games (if they can be run at all). It does run Dungeon Master, a favorite of mine. Gnu Chess runs fine, but Chessmaster 2000 blows to itty-bitty bits on my TT. I found that most point-and-click games (like card games) work on the TT.

By and large, software compatibility hasn't been an overwhelming issue. Running ST software on the TT is OK. However, what I would really like to see is more TT-specific commercial software. And, in cases where it might just be a question of re-compiling an existing program, it should be possible to offer TT-optimized versions of already existing software. Of course, some software would require more radical modifications. I would love to find out how blazingly fast Calamus would re-draw the screen if only it took advantage of the 68882 Floating-Point Unit.

I think that, even with the advent of the Falcon 030, the TT remains a powerful and flexible platform (at least for the time being). So, where am I going with this system? Well, I'd like to keep adding peripherals, such as a high-speed modem, and upgrade my floppy drive so it can handle high-density floppies. Also, the graphics cards available for the TT (some of which I saw at the Ace '92 show in Toronto) are very attractive upgrade alternatives.

On the software side, I want to continue to "UNIXify" my system. The next step may be the installation of GNU C, a respected freeware C language compiler that has been ported from UNIX to a variety of platforms, including the Atari ST/TT. I also look forward to running MultiTOS on my machine. And, of course, my wife and I will continue to use the TT as a platform for her professional DTP needs.

Hotel rates are $59 per night, single or double occupancy, and $66 triple or quad. These rates are valid from October 8 through 11. In order to obtain these special rates, you must mention AtariFest '92.

AtariFest '92 is presented by the Washington Area Atari Computer Enthusiasts

ATARI StockHolders Meeting

John Pilge

The Atari Corporation stockholders' meeting was scheduled for May 19, 1992. However, the court trial against Nintendo didn't end until April 27, 1992. (The jury could not decide on two of the three claims, so the court granted a mistrial on those two counts.) This caused Atari to delay the stockholders' meeting until June 2, 1992, 2 PM at Atari Headquarters. Officially, the meeting is to vote on the board of directors and to approve the choice of an independent audit company.

This is the first year that the board of directors owned less than 50% of the stock. In some companies, this might be cause for an exciting election result. But Atari is still a closely-held company. The board holds about 48% of the stock and Time-Warner owns just over 24% of the stock. There were only five candidates for the five board positions.

On June 2, 1992, 72.8% of the stock had voted on the following:

Jack Tramiel	42,014,116 votes
Sam Tramiel	42,024,726 votes
Michael Rosenberg	42,026,916 votes
Leonard Schreiber	42,075,816 votes
August Liguori	42,061,516 votes
Approval of the audit company	42,091,310 votes

The official part of the meeting lasted four minutes and 43 seconds. This is about average for Atari shareholder meetings.

After the official part of the meeting, president Sam Tramiel told of Atari's plans and answered questions from the audience. Since most people vote absentee, there is no reason to actually be at the meeting. About two dozen people attended. Most were friends of the board members, Atari employees, former employees and a few curious shareholders that lived nearby. A friendly crowd.

Sam Shares Information

Atari has discontinued selling their MS-DOS line of 386 and 286 computers. They only accounted for 10% of Atari sales last year and it was becoming difficult being cost effective.

The 2600 and 7800 game machines continue to sell well (mostly outside the US). New game titles for the two machines are planned for 1992. The Lynx should have 20 more titles available by Christmas. Video games machines accounted for 34% of company sales last year.

A Batman video game was planned to be released for the Lynx by June 19 (and it was shipped ahead of schedule). Lynx will sell with the Batman game while supplies last.

Code named "Jaguar," Atari's newest video game system is a 64-bit machine still in prototype. It will have a 10 key pad with joystick. Current plan is to have it available in 1993.

The XE line of computers are still being made. Though not available in the US market, XE systems are made for sale in Mexico, South America, Eastern Europe and Germany.

Code named "Falcon," the next generation of Atari TOS (which stands for "The Operating System" according to the Annual Report and the president of Atari) computers will support VGA monitors and have a new 56000 DSP (Digital Signal Processor) chip, which is also currently available on the NeXT platform.

There will be a 68030 version and a 68040 version of the Falcon family. The DSP chip will aid in digitized sound and music programs. Atari currently has about 17% of the music market.

The sale of Atari's factory in Taiwan was because of a land boom in the area. The land the factory was on became valuable. There is said to be an apartment complex there now. While Atari products are being made by contracted companies, Atari is still considering another factory.

The meeting was over in 50 minutes.

The State of ATARI

Bill and Pattie Rayl

To accompany the Annual Stockholders' Report by John Pilge in this issue, we've compiled related financial figures and other items of interest with a bearing on Atari's current state of affairs.

First, we'll look at some figures from Atari's most recent quarterly reports. Then, we'll discuss what these figures mean and how they are affecting Atari's business organization. Finally, we'll touch on the recent Forbes article concerning Atari.

Fourth Quarter '91

As mentioned in John Pilge's article, Atari delayed release of their 1991 4th quarter figures because of the then on-going law suit against Nintendo. (Atari lost the lawsuit.)

On April 3, Atari reported a loss of $4.4 million dollars for the quarter, as opposed to earnings of $1.6 million for the previous quarter and $8.8 million profit for the 4th quarter of 1990.

The 8-cents-per-share loss came on revenues of $96.2 million and included a $2 million credit for debenture repurchases. Revenues from the previous year's 4th quarter were $151.9 million, indicating a sharp decline in Atari's sales.

For the 1991 year, sales dropped to $258 million from $411.5 million in 1990. Net income for the year was $25.6 million, compared with $14.9 million for 1990. (The 1991 figure includes a gain of $40.9 million for the sale of the Taiwan-based manufacturing plant.)

Atari cut its operating loss for the 1991 fourth quarter to $9.4 million from $22.2 million in the 1990 quarter. Atari's operating loss for 1991 was $18.7 million, compared with a loss of $25.2 million in 1990. At that time, Atari's stock, which trades on the American Stock Exchange, was at $2.75 a share.

First Quarter '92

Atari's 1st quarter ended March 31, 1992. Net sales were $44.1 million as compared to $63.4 million for the same quarter in 1991. Atari also took a loss in currency exchange of $12.1 million for the quarter, as compared with only a $4 million loss in the same quarter in 1991.

When added to operating losses and other items, Atari posted a net loss of $13.8 million for 1992 as compared to a net loss of $2 million in 1991.

Second Quarter '92

The 2nd quarter ended on June 30, 1992, and Atari reported a loss of $39 million. Gross Sales were $23 million as compared to $49 million for the same period in 1991. Atari also reported charges of $34 million in losses of operating income for 2nd quarter 1992.

Atari's President, Sam Tramiel, said even with the loss, the company remains strong. "The company has over $60 million in cash and a strong balance sheet," Tramiel said.

Consequences

During the 2nd quarter, Atari began re-organizing its operations in order to "streamline" the company. As Bob Brodie puts it, Atari is "right sizing" its organization.

What does this mean in the real world? Well, a number of events have transpired as a consequence of this "right sizing."

Atari Canada has been merged with Atari US and is now called Atari North America. A small sales office is maintained in Toronto, public or contracted warehousing will be used to store, inspect and move products. A network of service centers will be set up for warranty and other repairs.

Many of Atari's non-US subsidiaries have been scaled back or closed entirely. These include Atari Australia (which is now selling only Lynx game machines), Atari Scandinavia and Atari New Zealand (which have been completely shut down). Nearly every subsidiary has been affected by the reorganization.

The Atari Entertainment division, which was located in Chicago, Illinois, has been pulled in-house. A number of the employees chose not to move out to Sunnyvale, including Tom Crosby (the division's head) and "some of the division's best programmers."

Atari has let their UNIX team go and the UNIX port has been put on hold. While UNIX has already been ported and runs fine on the TT, Atari is reportedly going to wait until release of the '040 based Falcon to push UNIX.

A number of projects have been put on the backburner, as Atari pins most of their hopes on the Falcon 030. The STBook, for instance, has gone into "redesign" because Atari found resistance to the machine due to it not having a backlit display. The Jaguar 64-bit home video game system is also slated for 1993 release.

Possibly worst of all, Atari announced at an August 14 private dealer meeting just prior to the Connecticut Atarifest that the MegaSTE was being taken out of production. And, the new Falcon 030 would not be shipping in quantities until early 1993.

This left many dealers wondering what they are going to sell for the 1992 Christmas season. In response, Atari has lowered the price of the TT, with prices recently seen at dealers for as low as $1500 for a 4meg TT without hard drive.

Earlier statements from officials at Atari indicated a huge roll-out of Falcon 030 machines in the fall of 1992, possibly as early as August. Current plans are now to have only "limited quantities" available by the end of October through the end of the year.

Forbes "Bashes" Atari

An article entitled "Cheap Didn't Sell" appeared in the August 3 issue of Forbes magazine. The article's cutline stated "Computer game maker Atari Corp. is in trouble again, a prime example of the dangers of pinching pennies on everything from marketing to expense accounts."

The article goes into a little of the history of Atari and the Tramiels, then points out numerous examples of mistakes and missteps made by Atari in the computer and video game markets in the past couple years. Many of the details in the article come from items that became "public" at the recent Atari/Nintendo lawsuit.

While the article is fairly hard-hitting, it points out that Atari does just barely have enough cash on hand to successfully roll out the new Falcon 030 and Jaguar "with the promotion needed to give them a real chance."

In reply to a question concerning the Forbes article during a recent GEnie conference, Sam Tramiel replied, "The Forbes article was a mish-mash and misconstrued article full of half truths. We are anxiously awaiting the release of the Atari Falcon to bring us back to the forefront. The article has given us some laughs, but otherwise has not affected us."

Atari's stock is currently trading at $1.25 per share.

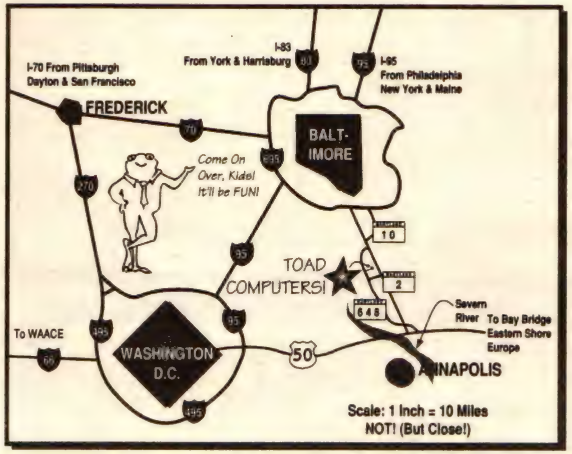
The Fest *before* The Fest

Attending the WAACE Atarifest? Come See the Nation's Largest Atari Dealer!



☛ Don't be daunted by the drive to Washington! We *really* want you to come to the WAACE Atarifest on October 10 and 11! And to prove it, we're promising to make it worthwhile!

You see, this summer, we went from being "Toad Computers: Atari Store and Friendly Place" to being "Toad Computers: The Atari Superstore (and friendly place)!"

How did this happen? Little green pills? A princess kissed our old store? No – it came with lots of hard work.

To show that we're using our new-found powers only for the forces of good, we're holding what we call "The Fest *before* The Fest."

"What is this beast?," I hear you mumble. Well, it's a time when Atari users can visit the country's largest Atari dealer, take advantage of a vast pre-fest selection (at Atarifest prices), and participate in classes, seminars (even one with Dave Small), and demonstrations.

And you get to see a real, modern, tangible and palpable Atari store. And not just an Atari store – an Atari Superstore. That means huge selection, the best prices and outstanding service – *every* time you visit.

So on Thursday October 8 and on Friday October 9, be at Toad Computers' new location at 570F Ritchie Highway in scenic Severna Park, Maryland. Admission is free. We're not far from anywhere, and we promise you, it'll be well worth your time.

Check the directions below, and if you have any questions, feel free to call!

Directions to The Nation's First and Only Atari Superstore

From Baltimore (25-35 minutes): Take I-695 (Baltimore Beltway) south to MD 10. Take MD 10 south to MD 2 south. After about three miles and very shortly after intersection with MD 648, turn right into Park Plaza shopping center. We're next to WeeCare.

From Annapolis (10-15 minutes): Take US 50 east towards Bay Bridge, over Severn River bridge. Immediately (!) after Severn River bridge, exit onto MD 2 north. After about 6 miles, turn left at light at McKinsey Rd. Turn right immediately into Park Plaza center.

From Washington DC, MD Suburbs, Northern VA (40 - 60 minutes): Get to east side of Capital Beltway. Take US 50 east to Annapolis. Follow directions from Annapolis.

If you need further directions, feel free to call and act confused.

Meet
Dave Small,
Tim Reyes,
and
Tom Harker!
Way Cool!

The Fest
before
The Fest

WAACE
ATARI
FEST '92

Where: **Toad Computers**
570F Ritchie Highway
Severna Park, MD 21146
When: **Thursday, October 8, 1992**
8:00 AM – 10:00 PM
Friday, October 9, 1992
8:00 AM – 5:00 PM

Where: **Sheraton Inn**
Reston, VA 22091
When: **Saturday, October 10, 1992**
Sunday, October 11, 1992
10:00 AM – 6:00 PM (both days)
Call: **(703) 629-6734, Charles Hoffmann**

THE LINK™ MEANS TRUE SCSI!

ICD, Inc.'s latest entry into the Atari marketplace is ***The Link***, a SCSI host adapter with a distinct *advantage*. It's external.

The Link will allow the use of all external SCSI disk systems, including CD-ROM units, Floptical drives, and all hard drive systems made for the Atari *Falcon* and TT030. It converts ACSI to true SCSI.

We at Toad Computers saw the importance of bringing you these revolutionary products *first* – at prices that can make you the first to own them!

At the Düsseldorf Atari Messe, the world's largest Atari show, we introduced our ***Stealth*** hard drive subsystems. They're designed with the Falcon, TT030, Macintosh (and ***The Link***) in mind. ***Stealth*** is small, black, portable, and sexy. You'll see *much* more about them very shortly.

The Link, combined with our ***Stealth***, CD-ROM, and Floptical systems, gives the ST/STE a new edge in mass storage.

The Atari TT030 and Falcon need no interface to use these drives (because they have a true SCSI port), but now every SCSI drive can be used on any Atari Computer.

Check out our great *new* deals on CD-ROM, floptical, and ***Stealth*** drive systems – get one while they're hot! Or, get a ***Link*** and become well-connected! Either way, you'll love the new options!

THE LINK™
INTRODUCTORY OFFER
JUST $89.99
Good for a Limited Time – Void Where Prohibited

STEALTH

The sleekest, smallest, under-monitor hard drive system. Black and very sophisticated. TT030, Falcon, Mac compatible. LINK required for ST, STE. Available in October. Place your order now. **$119.99**

CD-ROM

Chinon CDS-431
SCSI CD-ROM, Audio Drive $489
Complete external system in case with power supply

Font FunHouse CD-ROM $49
Contains Hundreds of Type One Fonts for PageStream 2
Also Includes Macintosh Versions of Fonts

Complete ST Package $599
Includes THE LINK, CD-ROM Drive, and Font FunHouse CD

THE LINK is required for use on ST or STE computers.
TT030 & Falcon users may use drive without LINK.
Systems come with two free CD's, PC host adapter & cables.

FLOPTICAL

Insite Peripherals I325VM
21MB Floptical Drive $599
Reads 720K and 1.44MB floppies with no hardware mods!
Complete external system in case with power supply,
1 disk with THE LINK included.

21MB Diskette $35
Each regular-size 3.5" disk can hold up to 21MB reliably!
Cheaper per megabyte than 44MB removable!

• Finally! A True High Density Solution!

☛ Now owners of 520/1040STE computers can enjoy the benefits of a high density disk drive without the hassles of upgrade boards that don't work, cutting your case to fit some off-brand drive, and incompatibility with emulators. Our upgrade uses an Epson 1.44MB drive (the same one Atari uses in the Mega STE and TT030) to match your case beautifully. And it's guaranteed to be 100% compatible with all upgrades, emulators (including Spectre GCR) and software! Send your machine in **toaday**. (Include a note explaining payment and return address.)

• Toad-Density 1.44MB Upgrade (Installed)	**$179!**
• Including TOS 2.06 (Optional, Installed)	**$229!**

• Toad TT 32MB SIMM Board – $399!

• Get Cool Deals From Toad!

Atari, Science Fiction and Cable TV

Patricia Snyder-Rayl

The following is an interview I held recently with Mike Kelley, who is heading up the SFAN cable channel. In particular, Mike let us know what SFAN is and how Atari is involved.

AIM: What is SFAN all about?

Kelley: The Space, Fantasy & Adventure Network is the first genuine effort to develop and launch a fan-oriented satellite/cable television channel specializing in Science Fiction, Space, Fantasy, Adventure and Horror programming. It is designed and defined to be an expanded-tier basic channel...carried in the same level of service as A&E or the Discovery Channel.

This accomplishes two vital missions. First, it will not be a premium service at a premium price. Second, because we will not have to meet over-the-air broadcast censorship requirements, we will (like A&E and Discovery) be able to transmit theatrical-release versions of movies rather than "edited for TV" versions gutted for network broadcast.

AIM: What sorts of things will SFAN have on it?

Kelley: SFAN will have a mix of the best series programming from the 50's through the 80's, the best and (laughably) worst movies from the 30's through the 90's, and original programming which will increase in amount and become more aggressive and daring as time and revenues permit.

Providing a detailed listing of our intended programming would be exciting, but we have spent thousands of dollars in consulting fees and hundreds of work-hours to research, track down and negotiate availability of the programming (some VERY obscure) which would be a wonderful "how to" shopping list for any other potential rival. We have gathered the best people to define the programming and the interests of the audience and we don't intend to give away that commanding advantage.

AIM: How is SFAN related to Atari Computers?

Kelley: The direct support Atari has provided in equipment, equipment support and ongoing interest has been a vital part of a very difficult development process. Through close coordination provided by Bill Rehbock and Mike Fulton, we have managed to make best use of the TT030 and Stacys provided us by Atari, and any equipment difficulties have been solved with complete cooperation.

This support from Atari has gained us support from many Atari developers and we have had the privilege of cooperation from folks at Soft-Logik (who even provided PageStream and fonts to Arthur C. Clarke for his Amiga 3000, for which they got a letter of endorsement), Lexicor, ISD and others. We have enjoyed this cooperation and it has resulted in the offering of DTP fonts and graphics from Computer Safari under SFAN auspices.

We would welcome further support from Atari hardware and software developers...and they will be recognized for their support when we are on the air nationally.

Perhaps one of the most important items Atari has provided is a letter stating their interest in SFAN as an advertising outlet for Atari products...the sort of thing to which the media and investors pay attention.

AIM: Has Atari Corporation's support been helpful?

Kelley: Most definitely...although I haven't yet been able to convince them to release the two dozen TT030s and dozen STBooks that I would love to have in my "ideal world." But, we have been able to help each other in some areas which we can recognize and some which we can't yet reveal.

A primary example of the cooperation between Atari and SFAN has to be bringing Walter Koenig (STAR TREK's "Chekov") into the Atari "family." SFAN acted as go-between in the arrangement that saw Walter become an Atari owner and which resulted in the interview published both in the newsstand Atari Explorer January '92 issue and the recent issue of the on-line Explorer.

Space, Fantasy & Adventure Network

And Walter *has* expressed an interest in acting as a spokesperson for Atari (in addition to being under contract to SFAN as Executive Producer/Host of a one-hour talk show). So, if fellow Atari users would like to see "Chekov" pushing Atari computers, please let Bill Rehbock, Bob Brodie and Sam Tramiel know.

We anticipate that Atari's involvement will only grow larger and more aggressive as our needs expand, but they do need to know if Atari owners want to see Atari take a more active and public role in the phenomenon of SFAN.

AIM: How will Atari computers be used for SFAN?

Kelley: Presently, the TT030 is workhorsing 20+ hours per day on telecommunicating and DTP while the Stacys are dispersed to other team members to allow them to generate files which we can easily plug into the vast quantity of documentation necessary for a project of this scope.

We are hoping to negotiate large-scale support from Atari for use of Atari computers in the areas of everyday business computer needs (networked), publishing of the newsletter (with aspirations of a magazine), storyboarding (as LucasFilms does), and scoring original programming as well as rescoring some older programming. As applications software evolves in other related areas, we would like to transition more tasks to Atari computers as quickly as possible.

How much would it help Atari to have their name on-screen nationally several times a day as "the official business computer of SFAN?" It's definitely a win-win situation for Atari and SFAN.

AIM: Why did you choose Atari computers for SFAN, rather than other brands?

Kelley: There are several reasons. First, I have owned Atari computers since my first 400 in 1980 and have kept abreast of Atari developments as the ST, STE and TT computers have come along.

Second, Atari impressed me several years ago by readily providing a half-dozen ST computers to my wife's minority school without any thought or promise of payback.

Third, I had been forced (unwillingly) to use the "other" GEM-supporting computer and (Heaven forfend!) the "best" computer ever designed in 1981. This gave me the opportunity to fully understand the true power and ease of use of Atari computers...my wife's fifth graders start doing DTP with PageStream within two hours of first seeing the STs.

Additionally, although Atari at times seems try its best to develop a ponderous managerial style, I felt they were more approachable than Apple, IBM or Commodore and more likely to be willing to "wing it" with us. Happily, I was right.

We simply feel that existing and upcoming Atari computers exhibit more of an understanding of the *real user* than do other computers and we won't feel compelled to pass up talented, creative people because they can't get command-line syntax just right.

AIM: How did you get started using Atari computers?

Kelley: In 1979 I had just reported to my third tour of duty as a Navy Airborne Electronic Warfare Officer and was learning to fly and duplicate Russian electronic countermeasures tactics. I needed (my wife will debate this) a computer to allow me to learn more about the new automated computer systems being developed for installation in Navy EW aircraft by learning about computers from the ground up.

Though the 400 wasn't cheap (and it took me just three months to "justify" an 800 with 48K of memory and a floppy drive), all of us in electronic warfare were pondering Atari, Apple, TI99 or IBM PCjr.

I passed up the Apple because of its bulk and lack of lower case (and lack of color graphics), passed up the TI99 because of the "chiclet" keyboard and amazing expense of peripherals, and passed up the PCjr because of cost and my experience with the reliability of IBM typewriters.

Well, Apple is still out there (still selling 8-bits!), TI99's are long gone and IBM stopped supporting the PCjr the day after they announced its demise.

My Atari 800 lasted until 1984 (sold in preparation for my first ST) and the 400 (with game cartridges) is sitting in my oldest son's closet...still functioning 100 percent. The 520ST was purchased immediately after its release, a 1040STF followed in 1988, a Mega4 in 1989, and the TT came into my hands in 1991. It's a long-term affair I continue to enjoy.

AIM: What got SFAN started? How did you come to start working on it?

Kelley: SFAN was originally conceived and defined in 1984 as a result of a conversation with a satellite dish technician. I was considering getting a dish and asked what the future of satellite programming might be...and the answer was "directed programming."

When I got to thinking about it, the logical answer seemed to be science fiction, fantasy, adventure, and horror, so I wrote a 20-page concept statement and added several pages over the next two years to refine the concept.

Because I realized that a project of this nature required contacts in the entertainment industry (which I did not have), it just rested in place until 1987 when I resurrected it out of boredom and started burning a lot of midnight oil.

I took a job in California and in very early 1988 made vital contacts in the music side of the film industry, then made the breakthrough of having Arthur C. Clarke (author of "2001: A Space Odyssey") evaluate the concept statement as "an excellent idea" and provide us with our slogan: "Science Fiction is the only *genuine* consciousness-expanding drug!" The weight of Clarke's comments connected me with an experienced Hollywood business consultant and it has evolved seriously since that time.

AIM: Who is helping you with this effort? Who is supporting SFAN"?

Kelley: We can count Bjo Trimble (Den Mother of Star Trek), Walter Koenig, Forrest J. Ackerman (who is considered the world's greatest expert on science fiction, fantasy and horror), Atari (of course), High Frontier space advocacy group (originators of the Strategic Defense Initiative *[Star Wars]* and the Single-Stage-To-Orbit [SSTO] reusable launch vehicle), Kelly Freas (SF artist) and Fritz Leiber (Master of Lankhmar...one of the original fantasy writers from the 30's pulps).

Many of the greatest science fiction and fantasy writers have promised material and/or cooperation, and we are negotiating with other writers and producers of note...but those negotiations are covered by non-disclosure agreements.

There are many others involved who will be coming on as staff employees when we are operational. SFAN is supported by private investors and my own funds...which has been made possible by the decision of many of the participants to defer compensation until we are funded. This has allowed us to develop SFAN without leveraging the project to financiers who might alter it into something unrecognizable or make negotiations for full-funding an impossibly complex process.

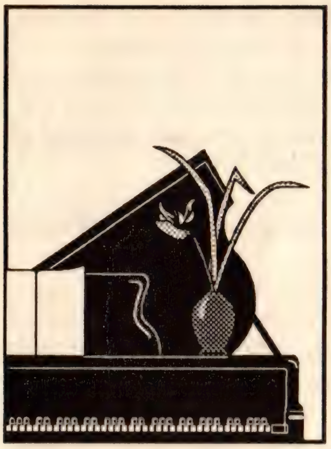
AIM: When will we see SFAN debut?

Kelley: The only honest and reasonable answer is that it is inextricably linked to the date of delivery of necessary funding. Any attempt to specify a debut date would be deceptive...since a three-day delay at one end of the negotiations might easily translate into a three-week delay in delivery of actual funding. And when you are into the realm of eight figures it isn't like applying for an auto loan.

We can be on-air reasonably within six months of funding, but on an emergency basis (going on-air parallel with other functions rather than at the end of all preparations) we can be up and broadcasting within three months.

When we issue a debut date we will issue only one and it will be "carved in stone" and met.

AIM: Thank you for joining us!



MIDI in the Midst
The Final Chapter

Kest Carter-Morgan

Readers new to this column might want to catch my '91 Chicago ComputerFest story from the beginning: "Initial Impressions" appeared in AIM's February issue; Parts 2 and 3 materialized in May and continued, through Part 4, in June. These reports are generated with a music technology slant, balanced with current, ancillary topics and rapidly evolving newsbits.

People have called me, asking for Hybrid Arts' proper address and phone number. Why? Because, only after I had submitted the article did I learn that the company had divided (not like protoplasm) into two other entities. One is Barefoot Software, Inc., and the other is, essentially, the new "Audio Group" of an existing company, Digital F/X, Inc.

As I understand it, Digital F/X, a video effects processor manufacturer, bought Hybrid Arts' direct-to-hard-disk digital audio recording and processing technology. Brad Eisenhower and some other ex-Hybrid Arts staff have continued to refine the 4-channel EX system. Their head office is: Digital F/X Inc., 755 Ravendale Rd., Mountain View, CA 94043. Telephone: (415) 961-2800.

On June 1st, I had the pleasure of meeting Brad Eisenhower during an EX demonstration, at the Best Western Shangrila, in Montreal. This demo was arranged to benefit the clients of Steve's Music Store and the general public. Impressed with what I'd written (on Digital Master and EX), he offered some clarifications, and other points, that may show up in a future addendum. It's quite a product; I wish them well!

When it became apparent that Hybrid Arts was no longer going to market and support the software lines, three ex-H.A. employees—Jeff Naideau, Dana Byrd and Brad Cox—formed Barefoot Software. They approached the authors and developers and obtained the licenses to carry on. This was a very worthwhile move—it prevented a large, installed base of users from feeling stranded and kept developers confident that their upgrade efforts would continue unimpeded. Barefoot Software, Inc., 19865 Covello St., Canoga Park, CA 91306. Telephone: (818) 727-7143; FAX: (818) 727-0632.

I remember witnessing, at the Chicago ComputerFest, how SmpteTrack Gold was such an improvement over earlier versions. As a result, I had planned to discuss its latest incarnation, "Platinum," at length, in this series of articles (along with an explanation of SMPTE). However, I have been overtaken by events: a temporarily incapacitating illness, a personal relocation and ASTMUM's participation in several shows since Chicago. Now, Hybrid Arts is no more and the software's gone Barefoot!

Don't worry. If you keep reading, I'm sure that you'll be rewarded! If you're already a SmpteTrack or EdiTrack user, you may be interested in this bulletin from Barefoot Software (or, if you're looking for your first full-featured, production oriented, monster sequencer keep reading!).

SmpteTrack/EdiTrack Platinum Upgrade

Revised Release

A New Look, To The Main Screen, Featuring:

A "tiling system" which allows portions of the screen to flip to other functions, meeting the user's needs at any given moment. This is much like windowing in that the user can, largely, reconfigure the look of the screen, except that the "tiles" come in predetermined sizes and don't overlap. That makes the code much more efficient, which, in turn, allows their reputedly excellent MIDI timing performance, during recording and playback, to be maintained.

Tile Types And Functions:

MIDI Recorder Transport tile (across the bottom of the screen in most configurations);

Track tiles allow 12 to 24 tracks to appear on the screen, at once, with more information per track than in the "Gold" version:

- permits muting of ALL tracks, including those under "Chain" control;
- provision for simple track looping (without needing a chain);
- A "wide-track" tile shows all multi-function column functions.

Control tile (much like the "Gold" control column, but in a different shape) The on-screen fader will control multiple channels, at once, to permit group volume control or adding modulation to several parts simultaneously;

Joystick tile (lets you simultaneously control two MIDI parameters, one with vertical movement, one with horizontal movement);

Group Mute tile mutes all tracks assigned to a particular channel with one mouse click.

Other New Functions:

Two Record Modes: For novice users, if the RECORD button is used, the count-off is heard and recorded material will be automatically saved, to the next empty track, when STOP is pressed. The PLAY button does not sound the count-off and any material played will be held in the "Keep Buffer" and saved to a track, in the traditional way, if desired. In advanced mode, the operation is the same as in previous versions of the program, except that the RECORD button causes the count-off to be heard, while PLAY omits the count-off;

Redesigned Quantize Function has user definable "grooves" and added parameters, like "strength" and "percentage";

Tap-in Tempo: Create a tempo track by tapping quarter- or eighth-notes on the Atari keyboard or a MIDI controller, or, record a song, out of sync, relative to the metronome. Then, while it's playing, tap-along, on quarter- or eighth- notes, to induce the program to realign the bar divisions and tempos to sync-up the tracks (to the tapped-in tempo). Essentially, this enables you to record in "free-time", without listening to the metronome, and go back and realign the sequencer's sense of bars and beats to the recorded material;

Weed Duplicates function eliminates overlapping duplicate notes.

New Graphics Screen Features:

Keyboard Equivalents for all graphics screen commands. Also, a new Option Menu allows changing of tempo;

Compatibility with TT Medium and TT High

Resolutions and, possibly, the TT cache;
Real-Time Track Velocity Shift makes track softer or louder during playback;
Durate Notes to a percentage of their current duration;
Sort Tracks by name or by channel and port;
Key command to Quit.

Once I've received a review copy of SmpteTrack Platinum and had two of our pros (longtime users of earlier versions, with MidiPlexers, etc.) lose themselves in it and emerge with a verdict, we'll have an interesting review!

Retail prices for SmpteTrack Gold ($399), SmpteTrack Platinum ($499) and EdiTrack Gold ($119) provide good price/performance ratios compared to the competition. Of course, dealers may sell for less. Other, familiar software items round out the line (ask for a brochure).

Before we move on to another Chicago show exhibitor, let me point out that, according to Brad Cox, Barefoot Software also handles some hardware, such as the MidiPlexer ($299), a DMA to SCSI converter ($225), some other items, and a SMPTE Chase Lock ($1000) for the "now old," 2-channel Digital Master system that I reviewed only a few months ago! He is also doing some discrete consulting and service, on the older equipment, by appointment; call for details.

Even if it stings a bit, it's better to land on your feet! On page 43 of this May's AIM, I mentioned Oregon Research Associates because I've met so many musicians who've landed in deeeep trouble by failing to back-up their hard drives. Guys, there's no excuse for this, especially when there are products like Diamond Back II to make pleasurable what was once a niggling chore! In that same issue, Bill Rayl reviewed Diamond Back II, helpfully revealing some considerations one should make when choosing a back-up utility. Oregon Research Associates, 16200 S.W. Pacific Hwy., Suite 162, Tigard, OR 97224, Phone: (503) 620-4919 FAX: (503) 639-6182.

At the Chicago show, Bob Luneski, author of Diamond Back II, mugged for the camera and cut capers with his irrepressible neighbor, Nevin Shalit, head of the Independent Association of Atari Developers and author of Tracker/ST 3.0 (another great product for the disorganized musician). I love their spirit, good humor and salesmanship; it contributed a lot to the feeling of good will at this massive show.

I'm pleasantly surprised that certain people I know are using Tracker/ST; I'll be comparing notes with them as I write my review. This is a very sophisticated mailing list and mail-merge program that could, for example, solve a lot of problems in the membership and newsletter circulation departments of a musicians' union. Step Ahead Software, Inc., 496-A Hudson St., # F39 New York, NY 10014, Phone: (212) 627-5830.

Being able to generate electronic or acoustic music, on demand, is a fact of life for today's musician. Being able to juggle many possible bookings can mean the difference between intermittent or steady employment. Personal info/agenda management programs, like Gribnif's CardFile 3 (now updated to CardFile 4), are especially helpful in keeping "more balls in the air." With phone-dialing capabilities (a MODEM is required), similar to Tracker/ST, CardFile 4 also has many useful features for the self-actualizing musician. Readers, please note that this is the latest info, from Gribnif, including their new address and phone numbers. Gribnif Software, P.O. Box 779, Northampton, MA 01061, Tel: (413) 247-5620, Fax: (413) 247-5622, Toll-free orders only: 1-800-284-4742.

The CodeHeads were doing brisk and friendly business at their booth. I'd like musicians to look into some of their products (i.e., MIDIMax, MIDI Spy, and even many of their shareware releases) which, I feel, justify a future article. Consider the time savings and smoother work methods possible when their programs, utilities and accessories are used. One of their brochures should state (if it doesn't already) "Products for Musicians, by Musicians" (if someone else has dibs on this phrase, let me know). Since Chicago, CodeHead Technologies has added even more goodies (soft and hard) to the line, so look 'em up! CodeHead Technologies, P.O. Box 74090, Los Angeles, CA 90004, Tel: (213) 386-5735, Fax: (213) 386-5789.

I got some interesting video footage at our own corner booth (ASTMUM, #06) when Marc Sauvé, doing a "chicken-strut" to the music, seemed to gradually disappear down some stairs, behind our table. It was just an act, but I peeked behind there, just to be sure! After all, Chicago had sprung many surprises on us (e.g., the submarine tour, the "Deadheads' invasion" of the hotel, etc.).

Our table featured brochures, maps and tourist info about Montreal's 350th Anniversary Celebration (ending, Oct. 12, '92). In a province that was rapidly becoming insular, this "prolonged birthday party" has induced Montrealers to look outward (and inward) while celebrating their uniqueness.

There's been no shortage of things to see and do, in our city, including a Montreal AtariFest. Although ASTMUM helped publicize Production '92, which happened in late May, Atari's name and products were not as prominently displayed as they could have been had Atari chosen to exhibit! Feeling that certain advantages of the Atari platform would be better presented by users, we decided to have another go.

Three Montreal-area users' groups are hosting this Atarifest and we've invited users' groups, dealers and developers in the NorthEast (and farther afield) to join in the fun. Festival Atari de Montréal et Environs (FAME), scheduled for this September 19-20, could be happening as you read this!

There is a very distinct possibility that ASTMUM will exhibit and do demos at the WAACE AtariFest '92, October 10 and 11. Depending upon certain members' availability, and other factors, we could take pleasure in "doing it again!"

News Flash!

This, just in: Micro Expo '92, a multi-platform, user-oriented computer show, is slated to take place in the South Hall of Montreal's Place Bonaventure on October 16-18. Hours are Friday, Noon to 9 PM; Sat. and Sun., 10 AM to 6 PM. Featuring a "Table of Experts" to advise and guide visitors to participants' booths, this show focuses on helping people find suitable computer solutions for their desired applications. For more information, contact: ShowFest Productions (Micro Expo), Tel: (514) 844-0502, FAX: (514) 849-9517.

I mentioned Micro Expo because our group is planning to be there! Even though it follows right on the heels of WAACE, I believe the Atari platform(s) should be present whenever people are refining their choices. I also hope Atari North America takes this opportunity to show the non-Atari public what the current and (hint-hint) newest models can do. They'd better not miss this chance!

Now, For The Wrap-Up.

Unlike the Washington trip, we didn't have room to bring a MIDI guitar to Chicago, but we brought a complete (remember Part 1?) sound system, keyboard, sound modules and more.

One of the modules (provided by Steve's Music Store in Montreal) was no larger than a VHS videocassette. It's called the Yamaha QY10 and is great for the musician on the go. This portable, musical notepad/sequencer/nearly-do-everything gadget cries out for you to put it to use. Check it out at your local Yamaha dealer.

By the way, the Roland Sound Brush and Sound Canvas modules and the U-20 keyboard were well demonstrated (Roland Corp. US, Guitar Plus) at the show. Most of you are now aware that you can assemble and fine-tune a heap of sequences and accompaniments (using Roland's "Band-In-The-Box" software and/or your favorite MIDI File Standard compatible sequencer) on your ST system and then arrange the files on disk for playback, in the Brush, to drive the Canvas (or any other suitable sound module) at a gig. Your computer and fragile monitor remain at home, so your kids can work on their term papers! The popularity and utility of the modules has since provoked a number of our members to participate, locally, in a quantity purchase (an ASTMUM benefit).

For complete descriptions and applications of Roland Products, I suggest you get on their mailing list. Their Roland Users' Group Newsletter can be obtained by writing to them. In the US: Roland Corp. US, 7200 Dominion Circle, Los Angeles, CA 90040-3647. In Canada: Roland Canada Music Ltd., 5480 Parkwood, Richmond, BC V6V 2M4. In Australia: Roland Corporation (Australia) Pty. Ltd., 38 Campbell Avenue, Dee Why West, NSW 2099.

Displayed (and played) at our booth were examples of our members' work in areas of jazz, fusion, a cappella voice, new age, film scores, techno and dance music. Feel free to write us (or call) for our productive members' ever-growing list of high-quality CDs, cassettes and sheet music (much of which is already distributed through record and music stores). We can even advise you if you're thinking of producing an original recording or want to get started in the music technology field.

ASTMUM was initially formed because people (musicians, artists, teachers and technicians) who earned their living with their STs were not happy with the quality of service provided in the Montreal area. Since 1987, our group has maintained a 24-hour repair hotline and procedural training for its members. Seminars and demos of new music equipment, workshops in the complexities of graphics and music production, and viewing video-tours, of Atari exhibitions, are typical activities of our group. Over the years, musicians, near and far, have joined ASTMUM. We welcome any who want to help keep the Atari users' and developers' community alive and healthy!

A musician, band or group is, today, more likely to take an interest in visual presentation and the ever-broadening selection of tools involved. Even though ASTMUM is also heavily into visuals, DTP and graphics (posters, flyers, brochures, cassette and CD jewel-box inserts), I have chosen to channel my graphics reportage into a separate article. It will cover things I've seen at this and other shows, balanced with some of our users' comments.

Near show closing, I made another sweep through the hall with the camera. "Oh yeah, I'd better check to see if I won that C-Lab wristwatch! Humm... Nope! But, what's this? That's my name! What did I win?" Bob Lytle pointed out that I'd won the shirt that my entry was pinned to. Behold! A huge, black, C-Lab Notator sweatshirt! This was the first time I'd won anything at any of these shows, so I hopped around for quite awhile.

The LCACE Chicago ComputerFest by Atari was quite a show. The Lake County Area Computer Enthusiasts put a lot of preparation and effort into it. If you're a Chicago area musician, you might check out their MIDI SIG (I recall that their contact person for music was Steve Yeaton). If, like many musicians, you've only used your ST as a sequencer, they (like ASTMUM) can also help you come up to speed in learning other, useful aspects of your computer. They may also be able to direct you to a club in your immediate area.

I, myself, would like to come back to Chicago and, without the pressure of a show, get to know people better. I remember meeting Dwight (J.J.) Johnson at the Dearborn show in 1989. He already had a twinkle in his eye. That twinkle became the Chicago show!

I had also met James Grunke, Atari's Director of International Music Markets, at the Chicago show. He indicated that Atari was going to work more closely with music application developers and dealers, and be a larger presence in our segment of the market. James Grunke even stated that he was impressed by the accomplishments of ASTMUM.

Atari USA supplied most exhibitors with computers (in addition to those set-up for MIDI-Maze, DTP workshops and many more for seminars). It was a massive undertaking, on a scale notably larger than the Dearborn show! Atari loaned us two Mega STEs. In appreciation, I bought one at the close of the show!

Those of you who made it to the show, dig out your souvenir programs and study what you might not have had time for before. Reflect on that and on the goodies you found, the people you met... Yes, it actually happened.

About the Author: Kest Carter-Morgan is an audio/video recording engineer, electronic prototype designer and computer repair technician specializing in ST-related projects. He is also a 5-octave manualist (plays music on his hands) with a large repertoire, and he is one of the founding members of Atari ST/Mega Users (Montreal).

CLIP ART from accusoft·st

ACCUSOFT-ST has prepared a library of quality IMG format Clip Art, all scanned at 300 DPI and ready to import into your favorite Desktop Publisher. We have over 100 disks ready to go with more on the way. They are topically organized, but with enough breadth to provide some variety on each disk. All Clip Art disks are double-sided, because these are BIG images with great detail. Each disk comes with our own ACCUVIEW file utility and slide-show viewer for IMG images (Version 0.24)and some useful tips on using Clip Art (including a full description of how the IMG format works in case you want to write your own programs). Here are over 100 of our more popular clip art disks:

(The Clip Art in this Ad has been reduced only 30-50%!)

Watch for Accusoft-ST at WAACE in October!

Stop in and see us.

Still the LOWEST prices, even for double-sided disks: 1-10 disks: $3.00 each; 11-20 disks: $2.75 each; Over 20 disks: ONLY $2.50 each.

HOW TO ORDER:

If you wish to place an order from the selections at right, jot down the disk numbers (legibly) and enclose a personal check. Shipping and handling is US$4.00 per order for U.S. and APO/FPO addresses; US$5.00 in Canada and Mexico; elsewhere in the world: US$5.00 plus $0.75 per disk. Washington State residents please add 8.2% sales tax. Add US$4.00 for COD orders (available in Continental U.S. only).

Not ready to order now? Send US$3.00 for our new double-sided Catalog Disk (Version 4.0) which includes complete descriptions of all selections, some neat freebies, a self-printing order form & more!

We have plenty of utilities, games, spectrum art, and applications. Truly the finest collection of PD & Shareware!

AAAUA

PRESIDENTIAL PONDERINGS by Alvan Sherrill

Wouldn't user groups function magnificantly if the officers were paid $100,000 a year? You can bet that people would be on time for every meeting and no job would be too large or too small. Atarians and wannabees would flood the mail with applications. Attendance would surge with members and applicants hoping to get part of the action. But, alas, the pay is zero. At least monetarily. I suppose that explains why it is so difficult to get volunteers. But, fortunately, there those who devote their time and expertise to fulfill the responsibilities of their office, often taking on tasks beyond those prescribed. For these few we can be thankful. We owe the existance of user groups to this unselfish group of Atarians who devote so much of themselves.

But, unfortunately, there are a few who will volunteer for an office and do little to fulfill their responsibilities. They will be habitually late to the meetings or perhaps not show up at all without notifying anyone. They accept their responsibilities most casually and frequently turn in marginal results or fail to accomplish them at all. If questioned, they will say "Look! I am a volunteer. If you don't like the way I am doing things, get someone else." I have heard more than a few officers say something similar. Indeed, a few have just "got mad" and quit! Is this the way it should be? If the pay were $100,000 a year, I don't think this would happen very often.

Suppose you or your child needed an operation that cost $250,000 and you had no insurance, but you were fortunate enough to find a doctor who was willing to perform the operation for nothing (Pro bono). Would you expect shoddy treatment or the best care available? Suppose the doctor said "Since I am not being paid, I'll try to get the operation out of the way in between my other appointments, as time permits." Wouldn't you expect the very best from this professional regardless of how much he was being paid?

Does not the same philosophy apply to the user group volunteer? If an officer accepts the responsibility of the position or other task, should not he or she do his/her very best? If the task is beyond the capability of the officer, or if he or she does not have the time, then the position or task should be politely declined. But once accepted, a responsibility should be a sacred trust. This is essential if we are to have viable user groups.

In the May 1992 issue of (FR)ANTIC, AAAUA's monthly newsletter, Subscribing member James Martin, currently from Tinker AFB, Oklahoma, wrote of his rediscovery of PAC-MAN, the Classic Atari 8-bit "arcade" game cartridge. His point was that a game does not have to be new to be good. This is certainly true of PAC-MAN as well as of many other games. Owning PAC-MAN, and naturally an Atari 8-bit computer to play it on, is owning a nostalgic piece of history. Remember when PAC-MAN could be found in any game arcade and in many restaurants and other places of business? Nintendo prices have dropped to around $80 now, but the games still sell for $35-$50. Compare that with an Atari 400 for $15-$20 or even an Atari 800XL for $40-$50 and games for these machines at $2-$10. Of course you won't find this equipment or prices in the big computer stores, but they can be found in flea markets, garage sales, user group swap meets and in some mailorder houses. The point is that they are now available for those who are willing to look;but, who knows for how long? So, buy an extra CLASSIC for yourself and for your kids or grandkids while they are available (the computer and games, not the kids). You may have to overcome the "herd" instinct in your kids (and in many adults), but that in itself is a lesson in life.

Some other Atari games that may be available at very reasonable prices are Galaxian, Defender, Missile Command, Space Invaders, Star Raiders (great animation), Star Raiders II (ditto), Pit Stop, Pit Stop II, Pole Position, Zaxxon, Preppie, Preppie II, Miner 2049er, Ball Blazer (tremendous graphics), Midnight Magic (pinball), and Rescue on Fractalus. I'm sure I omitted some very popular and fun games;forgive me if I didn't mention your favorite. The point is that there is a plethora of excellent and CLASSIC games for the Atari 8-bit, all at one tenth or less of their original price. So buy them when you find them and enjoy what still are very challenging and entertaining games. Be the envy of your friends. After all, anyone with money can buy a Nintendo game. But, only a true Atarian will appreciate the beauty and value of the CLASSIC Atari game.

A.C.O.R.N. Ft. Wayne IN.

Three Rivers Festival

July 11, 1992 will mark our fifth year holding our Three Rivers Festival event, The Magic of MIDI Music and Much More. Ten people have signed up so far to help out that our fun event (and probably help themselves to the cake and ice cream at the St. Francis Ice Cream Social that runs at the same time). If any others of you want to help out, either show up with or without your equipment or call one of the officers. We will start setting up around 9AM. I have sent a letter to Mr. Bob Brodie, Atari User Group Coordinator, to ask for brochures and any other assistance he and Atari can provide us. Even if you can't help out at our event, we'd still like to see you there during the afternoon so you can see what we do for the public. AND, if you have friends thinking of getting computers, here's and EXCELLENT chance to show them the kind of support our group offers.

ASTMUM

Our users' group consists of MIDI musicians, composers, videographers, artists, writers, technicians, students, teachers and business people. We also welcome new members, interested in learning about the ST/MEGA (even STE, MEGA STE and TT) models, and their applications, before purchasing.

Founded in 1987, ASTMUM provides its productivity-minded members with technical support, training and emergency assistance (24-Hour, Repair Hotline), laser printing and graphics services, as well as discounts (through participating dealers) on original software, computer hardware and music industry-related equipment.

To benefit its members, and the visiting public, our group has participated in these shows and expositions:

CEGEP Rosemont AtariFest, Montreal, September '88
WORLD OF ATARI, Dearborn, MI USA, June '89
PRODUCTION '90, Montreal, May '90
SIIM '90, Montreal, June '90
Windsor/Detroit International AtariFest, May '91
PRODUCTION '91, Montreal, June '91
SIIM '91, Montreal, June '91
WAACE AtariFest '91, Reston, VA USA, October '91
Chicago ComputerFest, Rosemont, IL USA, November '91
ACE '92, Toronto, April '92
PRODUCTION '92, Montreal, May '92
Connecticut AtariFest, Windsor Locks, CT USA, August '92

We have kept our members informed of Atari's progress on their most recent models (TT, MEGA STE, STBOOK and FALCON) through our large periodicals library, videotaped show-tours and interviews with software and hardware developers.

Encouraging members to form special interest groups, we hold monthly meetings (about two Sundays per month) and offer seminars and demonstrations. Some members teach others, in "hands-on" recording studio environments, at generous discounts. Masters of piano tuning, computer repair and instrument restoration work their magic. Incoming members are impressed by the efficacy with which our specialists troubleshoot the previously unsolvable. Even singers find help for their vocal problems!

In addition to helping ASTMUM musicians market their CDs, LPs and cassettes, at exhibitions and retail outlets, we have assembled a "sampler" cassette highlighting some of their work. You can order this extraordinary, chromium dioxide wonder (ASTMUMusic Sampler, '91-'92) for $12.00 postpaid! Please specify your choice of noise reduction: Dolby B, Dolby C, DBX or Super D. Make your Money Order (in U.S. dollars if you live in the U.S.A.) payable to K. Carter-Morgan and send it to our address, below. Your return address should be complete and clearly printed.

If you use your Atari in creating or performing music, and would like help in launching and publicizing an independent release, our group may be just the ticket.

Membership information, advice, product list and sampler cassettes may be obtained by writing to:ASTMUM, Attn: K. Carter-Morgan P.O. Box 966, Station B Montreal PQ Canada H3B 3K5 or by phoning (514) 272-6631 (voice only)

Executive Exhortations by Kest Carter-Morgan:

Illness, moving and other mishaps prevented us from participating in Montreal's large SIIM show (June 3, 4 & 5, 1992) and the Milwaukee (MAST) show, on June 14. I understand that it wasn't that well attended. If they have one next year, we'll try to be there!

We also had to forego attending the MIST AtariFest IV, in Indianapolis, this July 25th. The pundits predicted that this show, for its size, should do very well... The results should be in by now.

Although we helped promote the PRODUCTION '92 show (ref. page 43, paragraphs 4 & 5, in the May issue of AIM), high booth costs precluded our having a booth of our own.

We were pleased to find that another exhibitor (using Atari) was happy to distribute our users' group flyers at their rather interesting booth, but, even with their help, we were forced to lead a nomadic existence at this show. Atari's voice was, indeed, small (but present) in this maelstrom of computers, workstations and media industry equipment (see our members' reports in future issues).

The magazine, "Qui fait Quoi" did show their appreciation by granting our members free, $15 day-passes to the show.

By the way, I'll be happy to send (free of charge) an original, 40-page, glossy, bilingual, PRODUCTION '92 show program to each of the first five people who make the effort of writing to me, from out-of-town, requesting it (offer expires 30/09/92).

On balance, it's not so bad, however. ASTMUM has managed to "do" SEVEN shows from May '91 through May '92. Those members and friends who experienced parts of it have benefitted and learned a lot. That which we've been able to document, on videotape, has been useful and entertaining to members at home.

By the time you read this, the 1992 Connecticut AtariFest, in Windsor Locks, should be imminent (Aug. 15-16). Since it's a pleasant drive south, from Montreal, we've made plans to be there. If you attend and you're interested in our activities, please drop by our booth.

Our data-bank, of people interested in MIDI and digital audio/video signal processing, is growing to the point that a disk newsletter is being considered. Anyone interested in subscribing to and/or writing articles for the newsletter may contact us.

On September 19-20, ASTMUM will also be participating in FAME '92 (Festival Atari de Montréal et Environs), along with other users' groups, local dealers, Atari developers and visitors from all over the NorthEast! Please look for details, elsewhere in this issue, or call us at the above number.

Adieu for now!
KCM (ASTMUM)

BRAG*ST

General Meeting JULY 16, 1992 by Dane Stegman

Our Chairman, Mark Pierro began our meeting at 7:40pm. Mark announced the Top Ten PD Programs from the July issue of ST Format. Mark also said that the magazine could be purchased at the Village Green Book Store. Then our treasurer, Gerry Genson gave a financial report, we have about $500.00 in our treasurery. Our first demo was Codekeys by CodeHead Software, demonstrated by Mark Pierro. Our next demo was Mavis Beacon Teaches Typing by Software Toolworks, demonstrated by Gerry Genson. We then had are usual break and raffle. The winner of the door prize(Box of 3 1/2 disks) was Mike Burkley, the winner of the raffle prize(CodeKeys) was Carl Barron. Mike Burkley then began to show everyone a game called Challenge Golf. After several tries Mike could not get it to run properly. He was donating the disk to our library. We then had an open forum. The meeting end ed at 8:50pm.

HACE

Good News For All Hace Members And All Atari Users.

The HACE Atari Safari '92' committee has just received confirmation that two Atari software developers will have booths at the Safari. John Eidsvoog and Charles Johnson of CodeHead Technology will be present and have agreed to give a talk. Mike Vederman of Double Click has indicated that he and the Double Click crew will be present. Double Click will also give a talk. Bob Brodie and these important developers presence at this meeting gives all area Atari Users a great opportunity to learn about their computer platform and meet key "Atari " people. This good news is an incentive to users, dealers, and developers to be present at the third annual ATARI SAFARI. This is an invitation to the world wide Atari community to come to Houston in October.

"See you in October", Bill A. Kithas

MACE

August Minutes The August meeting went off without a hitch, everyone of the officers brought a computer and the CAD programs performed well. There were two electronics board drawing programs for the 8-bit, Schematic Designer and Circuit DataBase brought in by Anton Malje. Anton liked Circuit DataBase better because it is not copy protected and has a zoom feature. I had brought 3 Cad programs to show off, Master Cad, Cad-3D Studio and GFA Draft. The first two worked in 3D the other worked in 2D. There was definite interest in Cad programs when we asked some of the members why they were there. Member turnout was good considering summer, Although, Michigan has been colder and wetter then usual for the month (it was raining the night of the meeting).

The highlight of the night was when I loaded an automobile in Cad-3D Studio, at the time it had the engine and drive shaft, body and wheels and the seats. The whole car (79 Ford Granada) took up 120K and has forty parts to make the engine and body. I will finish the project and put it into our library for those of you who have Cad-3D Studio. For those of you who don't have Cad Studio or the other fine Antic Cyber products, advertisements at the meeting were quoting prices of $14.95 each or $20 for three Antic Cyber 3D modeling programs and GFA Draft 2.0 for $9.00.

The night wore on and the librarians showed off their Cad demo's which can still be bought at this election meeting. The meeting broke away at about 9:30 with tired but happy members.

Sept. Meeting

This meeting we will be having officer elections. A chance to get free membership for the next year. Your probably wondering what spots are available just in case you get the urge to get a little more out of this club, well here is a final run down on positions.

Club President; Vice president; Journal Editor; Recording/corresponding Secretary; 16-bit Librarian; 8-bit Librarian; Treasurer; Membership chair Meeting Coordinator

The rest of the meeting is reserved for swap night. If you have something you want to sell - bring it along, or if you want to buy - bring cash. This type of meeting always draws a crowd. Last swap night happened in January but because of the School being closed we moved to Mark Tappens house. Needless to say the basement was full up to the rafters with people and actual movement was hard. That situation has been improved since we are back at the Southfield Civic Center so there should be no problems (except for your cash flow).

October Meeting

October is going to be somewhat of a surprise depending on what happens at the election. Maybe Halloween will have the Falcon?! Either way the club has some planning to do.

SOMEWHERE ONLINE

MACE has a bulletin board running for those of you who use their modems for fun or profit. The download library is packed with 8 and 16-bit programs and files. Some of the catagories are art, demo's, music, basic prog's, utilities and text. The MACE Journal is put into the text section and is labeled something like 'MJAUG92.TXT' so to get a list of Journals put down 'MJ*.*'

The latest Atari news can be found on the Tari Forest, spec's for the Falcon lately; and you can find news about Molin's Den (the bulletin board for Waug). Inquiries about membership or library disks and whether they will be available at our next meeting can be sent to the Tari Forest. Also any questions you might have or comments about the club can be posted on the board. The number of the Tari Forest is 278-6466, 24 hours a day at 300/1200/2400/9600 baud.

Our next meeting is scheduled for October 20, 1992 at the Southfield Civic Center, under new management. I'd really like to see you there.

OHAUG

PRESIDENTS MESSAGE by ALEX PIGNATO

The "CLASSIC 8 BIT" magazine campaign is over, and has been tabulated, indicating 600 plus returns. Our inside source, our member BEN POEHLAND, says it's a definite success, with names still coming in. The process of final negotiations with UNICORN PUBLICATION took place in JULY. The target date for the first issue is set at this time for October 1992. The magazine is expected to be printed 6 times per year, with a disk 3 times a year.

I'm proud to announce that the members of OL' HACKERS, have VOLUNTEERED UNANIMOUSLY, to do the packaging and mailing out of the 3 seperate disk issues for the first year of publication, in order to help get the CLASSIC 8 BIT mag off and flying. That relates to over 600 disks to be labeled, stamped packaged and mailed, quite a hefty job. Yes, that's right, a whole club UNANIMOUSLY agreed to do this BIG chore 3 times a year as a LABOR OF LOVE for our 8 BIT micros. That's real devotion, but then the OL' HACKERS have always done their utmost to have people stay with the 8 BIT, that's why our membership keeps growing while other clubs memberships are dwindiling.

It is our belief that this was and is our last chance at having a magazine devoted entirely to the 8 BIT, so be sure that when the time comes you follow through and send in your subscription dollars without delay. We need each and every 8 BIT owner who wants to keep his micro viable to follow through! This is a time for ACTION. We raised enough hell, and complaints because we were being ignored or worse commited to the dung heap. Well now the 8 BIT community took things in hand and are correcting that. So stay tuned and we will try to keep you informed.

MINUTES OF AUGUST 1992 MEETING

HAROLD PEGLER passed out the updated version 2.0 of the LIBRARY DISK to the members. The disk has PRNTSTAR.BAS on it on the back side. You can call up a file and print it with this program. A great idea HAROLD!

CORRESPONDENCE: From the JACG of New Jersey newsletter, of Aug. '92. They commented on the continued very vigorous growth of the OL' HACKERS while most other 8-Bit clubs are losing members.

RON, for his demo, described how to change a pressure pad on your disk drive. This is the most cost effective improvement you can do to your disk drive. In order to protect the read/write head use a disk and put a piece of masking tape on the top of the disk opening. Put this disk in the drive. This will protect the read write head.

Over the read write head is the pressure pad. It is a round plug with a felt pad in it. Look at it. If the felt pad is worn then you must change it. To change the pressure pad close the disk drive door and lift up the holder press the pad together and pop it out of the holder. To insert a new pad put the plug under the holder and gently press on it until it pops into the hole.

New pads are available from BEST ELECTRONICS. For INDUS and 1050 drives they are $2.00. For 810 drives they are $.75. If you are going to order something from them you are urged to also order yourself a spare drive belt. They are very hard to get and this is the only source. They are $4.50.

In a recent issue of AIM, there was a description on how to use the top end of a BIC PEN as a pressure pad. DO NOT USE IT. It fits O.K. but it ruins the back of your disk and you cannot use it as a FLIPPY DISK. It most likely will also deposit plastic on your READ/WRITE HEAD.

Another great meeting is now a thing of the past. Darn it, I hate to wait another month for the next one!

Submitted by Ron Fetzer

PACS

Meeting Notes for June

Our Sig has acquired another Monochrome monitor a green one with sound as well as an Atari 400 both donated by fellow P.A.C.S members. The Sig would like to thank them for thinking of us when they had used equiptment they no longer wanted.

Chris Luckey's Demo of his newest board did not come off as welll as the ATR8000 last month due to hardware and software problems, we didn't have anything at the meeting capable of the transfer rates the board was able to handle. Things can really get tricky above 9600 baud.

The Kid Sig made a good showing with Jessica Cavanagh and Amanda Collins handing out copies of their newsletter. It seemed as if they were everywhere you looked promoting their KID SIG. Jessica made sure their newsletter was at the P.A.C.S. table and Amanda saw to it that Dr. Longo had his copy. She made sure he knew she is the Kid Sig Editor and Jessica is the President. The article they contributed to our newsletter made a nice addition. I hope they keep them coming. The also had a poster they had made up to show what a disk looks like inside of its sleeve, which they used to show why they are called floppies.

Bob Shuster has offered to continue taking care of the BBS and will continue answering questions posted there. If you can lend any help please let Joseph know. The time for the ST meeting has been changed to 10 AM and should be listed in the back of the DataBus soon. We switched with the 8-bit programing segment as Jim and Joseph have work schedual conflicts. This should help them and our ST members as Jim will be able to bring his ST to the meeting now.

SDACE

General meeetings are the 3rd Monday of each month at the North Park Recreation Center Social Room, 4044 Idaho Street, at 7 p.m. ST workshop/8-bit meetings are on the 1st Thursday of each month at the North Park Adult Center, 2719 Howard Street, at 7 PM. All meetings are open to the public. Annual SDACE subscription dues are $18, which includes increased BBS access, AIM subscription, SDACE quarterly newsletter and reduced rates on the disk-of-the-month.

SDACE's address is PO Box 900076, San Diego, CA 92190

President	Dan Phillips	(619) 462-1289
Vice Pres	Dean Smith	(619) 582-8157
Secretary	Jim Trageser	(619) 223-4608

Things are slowing down in San Diego for the summer. Our BBS wizop, Steve Kiepe, has been reassigned back East by the Navy and leaves Oct. 1. Tom Smith has graciously agreed to take over the BBS and keep it going for a year until Steve returns to San Diego. In addition, our PD/shareware librarian, Dennis Kay, has also had to cut back on his time involvement. Frank Miller has taken over as librarian.

WAUG

The Washtenaw Atari Users Group meets the second Tuesday of every month at the Colonial Lanes on South Industrial in Ann Arbor MI beginning at 7:30 PM. We support all Atari computers including 8 bit, ST/STE/TT and Portfolio. A vast library of public domain and shareware programs is available as is help for both new and experienced users. WAUG is supported by MOlin's Den BBS at (313)451-0524 and Clear Thinking BBS at (313)971-6035. We can also be reached by phone c/o Craig Harvey at (313)971-8576 or by addressing mail to 14 Payeur in Ann Arbor MI 48108.

The August meeting began at 7:30PM with the room completely turned around from past meetings. The 8 bit demo was the first item on the agenda as the "classic" enthusiasts had planned to begin a little earlier than the regular meeting schedule.

The demo that 8 bit Librarian Ralph Salmeron presented was from the July AIM disk-of-the-month. This demo was a program actually used by a British petroleum company to graphically demonstrate the process of exploration and recovery of underground oil reserves. Also on this disk were some hard drive backup utilities and a story book maker program. Ralph in addition had the AIM August disk-of-the-month available with the following on it: Snapshot -- a task switcher that can make use of the disk as virtual memory. Weave -- a disk formatter that will enable extra sectors. Along with these were a Tetris clone and an indexing program.

President Craig Harvey spoke to the assembled members about the position of Portfolio Librarian (the ST Librarian will get stuck with it) and next month's meeting topic, namely programming languages and telecom scripting. He also briefly discussed the need for some type of policy regarding smoking during the meetings. The vote among the members determined that we will have no smoking in the room during the meeting but that a short intermission to leave the room will be provided for smokers in the group. Craig then reminded anyone who is interested in helping out at the October show to contact Dave Brzezinski.

ST Librarian Mike Olin told the group about new club library program that would print in two columns using the built in fonts on popular 9 or 24 pin printers as well as DeskJets. As a demonstration he handed out double column printed sheets listing an astounding 19 new library disks ranging from games to utilities to languages to telecommunications, etc. and including the AIM July and August ST disk-of-the-month.

Member Roger Tanner presented his demo of how he is using his ST to design, build and test his telescope controller. He talked about some of the programs that he used in the design including Athena Cad II for the circuits and telescope mount assembly, his use of the ST to write Assembly programs for the controller's MC68000 cpu, and the use of his ST as an eprom programmer for the custom chips he required. Roger brought along the telescope controller electronics with it's paddle controller (ST supervised automatic control is coming soon) and fielded members questions about the programs that he used, problems that he ran into and the operation of the controller itself. Particularly interesting were some of the questions an answers regarding the problems pertaining to precise control of the telescope and the reasons why that was absolutely necessary. One wise guy even asked if Roger's device had achieved FCC A or B certification to which his reply was that he wasn't sure but the fact that his stereo quits when he turns it on might provide a clue. The work with the controller has been an on going project for 3 years and has all been done with Roger's original 1985 ST. Not content to just use his ST for things which most of us couldn't even understand, Roger let us know that he also uses his ST for more mundane purposes such producing the newsletter for his astronomy club with PageStream.

The monthly drawing was held with 8 bit prizes going to 2 lucky winners and 3 ST users taking home a prize too.

Next month's meeting will also see the assembly of our 8 bit hard drive system.

Neron Nesmith spoke briefly about Atari's appearance on the PBS show Computer Chronicles and promised he would bring a tape of it to view at the next meeting.

Craig solicited comments and questions from the members as the last order of business. The majority of questions were about the availability of PD programming languages for both the ST and 8 bit machines. Hopefully all will be answered at the next meeting which just happens to be on that very topic.

The meeting was adjourned at 9:15PM.

Respectfully submitted,
Dan Cable, Secretary

WNYAUG

August 1992 Meeting OLD BUSINESS: Your humble Secretary reported that she had written to Bob Brodie at Atari Corp. regarding the recent mixup about 8-bit support in the area. Mr. Brodie replied quickly and informs us that we are still an officially registered Atari user group, but that he was unaware that we were an all-8-bit group until now.

Christine also noted that the BBS number and a few other minor errors exist in Atari's records pertaining to us, and that she will write again.

NEW BUSINESS: Mike and John showed a disk containing several MicroPainter pictures of WNYAUG logos that Mike and others had created. John and Dave Shane put the disk together using DL Master, and the Antic Picture Converter to convert Koala pictures to MicroPainter format.

John demonstrated the commercial version of the Daisy-Dot III Print Processor from Roy Goldman. Copies of David Richardson's DDIII User Manual were distributed, this is a public domain manual that prints out with DDIII and constitutes a gripping illustration of the power and flexibility of this program.

The split club jackpot drawing was then held, and our SysOp, Don Koepf, made off with the booty once again, proving that he has surpassed Kevin Packard as our resident "Keeper Of The Horseshoe". That's three times, Don...give somebody ELSE a chance!

The meeting adjourned at 9:45 PM, but as usual, an informal circle of minds assembled in the parking lot afterward.

WARP 9

Bill Rayl

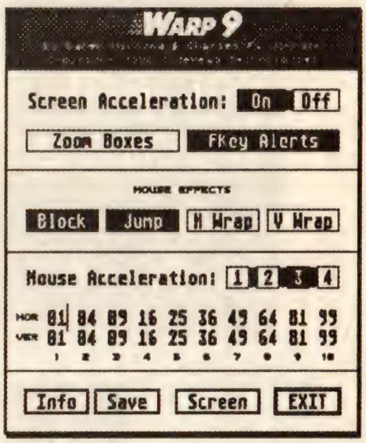
Computer users always want more speed. The faster, the better. When it comes to speeding up your current machine, there are two general approaches. First, you can purchase hardware accelerators to speed up the CPU. While this is generally fairly expensive, it does give you the greatest possible speed increases.

The second approach is to use a software accelerator. Software accelerators can speed up your screen redraws, making your computer usage more productive. While the actual speed at which your computer runs is not enhanced, your system does feel more 'zippy'...GEM windows display faster, your word processor scrolls through text faster, etc.

(Of course, you can add both hardware and software accelerators to your system and benefit from the addition speed of both products.)

Warp 9 from CodeHead Technologies is the very best in software screen acceleration for the Atari ST and TT computers. Built upon the foundation of Quick ST from Branch Always Software, Warp 9 offers speed increases of over 400% in some cases. Even better, compatibility with your favorite software is a high priority in Warp 9. The CodeHeads have done a great job of making an excellent piece of software even better.

The software consists of the Warp 9 program (which goes into your AUTO folder) and the Warp 9 Accessory. The accessory gives you piles of configuration options and access to the many extra features Warp 9 offers.



Screen Acceleration: On Off

Mouse Acceleration: 1 2 3 4

```
HOR 01 04 09 16 25 36 49 64 81 99
VER 01 04 09 16 25 36 49 64 81 99
     1  2  3  4  5  6  7  8  9 10
```

Speed Options

Via the Warp 9 Accessory, you can turn Warp 9 on and off. The option to disable Warp 9 is there just in case you have some incompatibility with a software package you run. It's also handy to show you just how much of a difference this software can make on you daily computer usage.

After using Warp 9 for a few hours, try turning the acceleration off for awhile. If you're like most people, you won't be able to use your system for long without turning Warp 9 back on.

The accessory also lets you turn Zoom Boxes off. While Zoom Boxes are a nice effect, they take time to display...and every nanosecond counts in the computer world.

Warp 9 isn't just a screen accelerator. It's also a mouse accelerator with four predefined levels of speed increase. If those don't suit your taste, you can create your own custom acceleration. You have full independent control over the horizontal and vertical speed.

Other time saving options which can be set via the Warp 9 Accessory deal with 'Mouse Effects' and 'FKey Alerts'. Selecting the FKey Alerts button in the accessory makes it possible for you to select the first three buttons in *any* GEM dialog box by pressing a Function Key.

Mouse Effects

The Mouse Effects settings can increase the speed at which you can get from one place to another with the mouse pointer. The Block option stops the mouse from being able to move into the Menu Bar at the top of the screen. With Block set, you must press the right mouse button just prior to attempting to select menus. If you find yourself constantly dropping menus down when you don't want them, this is a handy option.

Jump is even more useful. This option causes the mouse pointer to jump immediately to the Menu Bar from wherever it is on the screen as soon as you click the right mouse button. This can be a real time saver, especially if you have a big screen monitor. Using Block and Jump together provides the best of both options!

You've listened
to your MIDI
equipment. Is it
listening to you?

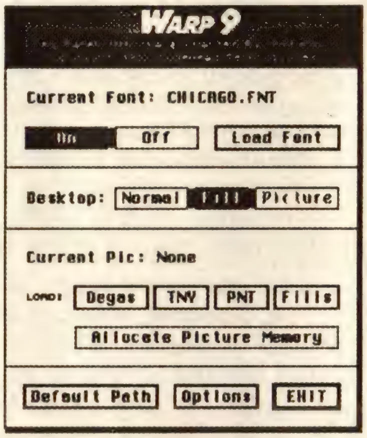
Finally, H Wrap and V Wrap allow the mouse pointer to 'wrap around' the screen in either horizontal or vertical direction. For instance, if you have H Wrap on and pass the mouse pointer off the desktop on the righthand side, the pointer reappears on the lefthand side of the desktop. While these options do offer faster ways to get from one side of the screen to another, they can take a little getting used to.



Current Font: CHICAGO.FNT

Desktop: Normal ● Fill ○ Picture

Current Pic: None

If you're short on memory, the CodeHeads include a configuration program that you can use instead of keeping the Warp 9 Accessory installed.

There's More?

As if all that weren't enough, Warp 9 also gives you the ability to change the system font and desktop fill pattern. Or, you can replace the desktop with your choice of DEGAS (.PI? or .PC?), TNY or Prism Paint (.PNT) picture files. You can even have Warp 9 automatically load and install your selected font, fill pattern or picture file at bootup.

While replacing your desktop with a picture uses some system memory, it does not slow your system down and causes no compatibility problems.

Another utility in this package is the Warp 9 Customizer. This tool lets you create, edit, save and/or load fill patterns and fonts. It can also load fills and fonts for use if you don't have the Warp 9 Accessory installed.

At a suggested retail of $44.95, Warp 9 is probably the least expensive acceleration option available. Once you've used the package, you'll find it worth every penny, too! Users of any previous version of Quick ST or Turbo ST can send in their original disks and upgrade to Warp 9 for only $20.

TOS Extension Card

Mega ST Bus Bridge Version

[This article comes to us courtesy of the Front Range Atari User Group and originally appeared in the June '92 issue of their newsletter, the FRAUG Lily Pad.]

Robert Andersen
FRAUG

Many ST owners have longed to have the New Desktop and upgraded TOS included with the Mega STE and TT, but had to settle with NeoDesk to get most of the same features. This is not to say that NeoDesk is an inferior program. Far from it, but the New Desktop offered us the ability to use a new, user-configurable ROM-based desktop to access our information.

Thanks to CodeHead Technologies and the TOS Extension Card, or TEC for short, users of the older ST line can now upgrade to the newest TOS (currently 2.06) without having to spend an arm and a leg for a new computer. The TEC board was actually designed in Germany and is marketed over there by a company called Artifex.

There are, according to the manual, four different installations of the TEC, but only three different versions. The first version is the base soldered in version for the ST owners. This one requires either an individual who is experienced with electronic devices to install it themselves or a profession installation by a dealer. The second type is the CPU bridge, which also requires some soldering. And, finally, there is the solderless Bus Bridge version which requires a Mega ST with the built-in Bus Connector. This last version can be installed by just about anyone with basic electronic skills.

Having a Mega ST, purchasing the solderless Bus Bridge version was the easiest way for me to go. The actual card itself is very well laid out and neatly packaged. The documentation was simple to follow with figure drawings to help in the installation.

After reading the instructions through, an individual should feel confident enough to venture into upgrading their own machine. If there is any uncertainty, have a professional install the TEC for you.

The instructions were so easy to follow, it almost seemed like there was something left out or forgotten. Installation was as simple as opening up the machine, removing the two old TOS chips, and plugging in two connections to finish the installation. Two-sided foam tape was included to secure the board in place once installed. All that was left to do was reassemble the machine and enjoy the New Desktop. An optional switch can be installed to allow the older TOS to be used, for compatibility with certain programs. This switch should be added by an experienced installer.

CodeHead Technologies was nice enough to include many extra items on their Utilities disk including an icon juggler, Pinhead, CPXs for the new Control Panel, NoRoach, SetSeek and WriteOff, along with documentation for the new TOS 2.06 explaining all of the changes.

CodeHead's TEC is, by far, one of the best investments an individual with an older ST can make. A definite must have!!

CATCH A RISING STAR!

Cooling Fan Installation for the Atari STe

Niles Russel

Have you ever noticed how much heat is generated by the power supply in your STe? I did, so I decided to mount a cooling fan to improve the cooling efficiency of the power supply.

It is a well known fact that component life is greatly extended when kept cool. In fact, when I opened up my STe and inspected the power supply, I noticed the area on the printed circuit board that has the transformer soldered to it is starting to discolor, indicating the build up of heat.

The Ol' Disclaimer

This whole project is put together as a suggestion, offering tips and hints to add a cooling fan to your computer. I offer no guarantees whatsoever, nor will I be held responsible in any way if the information provided is incorrect or modified.

In other words, it is strictly up to you to do the job correctly and insure its safe operation, as this is an electrical modification to your computer. If your computer is still under warranty, this will make that warranty null and void, as this is a modification.

Since this project involves working with electricity, disconnect the computer from the power source. In other words, don't work on your computer with it plugged into the wall!

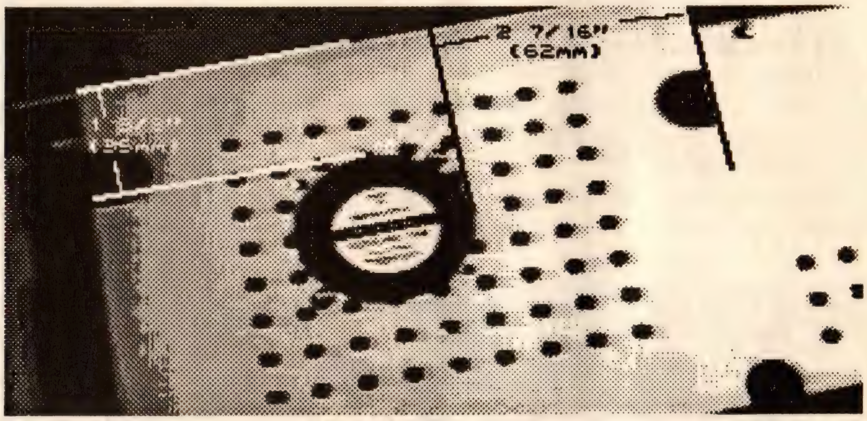

FIGURE 1
THIS PICTURE SHOWS THE SHEILD THAT COVERS THE POWER SUPPLY. ALL MEASUREMENTS GIVEN ARE APPROXIMATE. CHECK AND RECHECK BEFORE YOU CUT. YOU ONLY GET ONE CHANCE TO DO IT RIGHT!

Nothing is worse than getting shocked, or possibly electrocuted. Okay, now on to the fun stuff!

Selecting the Fan

The fan I selected is sold by Radio Shack, part number 273-244. It is a 1-9/16" DC brushless micro fan. It is rated at 12VDC (volts direct current) and displaces 3.5cfm (cubic feet per minute).

I was concerned about how much current the fan would draw, as I decided I would hook it into the power supply. Radio Shack states on the back of the package that this fan draws 100mA (milli-amps) max. I hooked the fan up to my ohm meter to find that, at full load, the fans draws right at 72mA. I could live with this! The project was on.

Why wasn't a 120 volt fan used instead? Well...space was a consideration, as you will find there is not a lot of it. Most of the fans offered were too big to fit in the space where I wanted to install the fan. And the biggest reason of all was that I didn't want to hack my case up.

Mounting the Fan

Viewing Figure 1 will probably help you get an idea of where I located my fan. These pictures were created with the help of VIDI-ST. Although they are not as clear as I wanted them, I hope they give you an idea of how the project was accomplished.

First, you need to remove the case. There are some screws on the bottom of the case that need to be removed. Remove only the ones that are in a square-type hole. Once you complete that, remove the screws that hold the shield covering the power supply.

The fan will be mounted on the underside or bottom of the shield covering the power supply. The measurements are approximate, so check and double check your measurements before you start drilling and cutting.

The fan was strategically located on this shield because of the heat sinks on the power supply's printed circuit board, shown in Figure 2. Take note, however, that your power supply may be different than the one I have. Mine is made by Mitsumi Electric, TC1-A75. If yours is different, you may have to adjust the location of your fan.

You will notice a box I have drawn in Figure 2. This is the space that the fan will take up. You need to position the fan in such a way that it will not come in contact with heat sinks, power resistors or other components. I found that R108 (R is for Resistor) sits up fairly high and contacted my fan, making cool grinding noises. After carefully bending the resistor down slightly, the problem was eliminated.

Once I had found where I wanted to place the fan, I carefully laid it out and marked it with a pencil. In fact, I wire tied the fan to the shield, making sure it cleared everything before I started cutting.

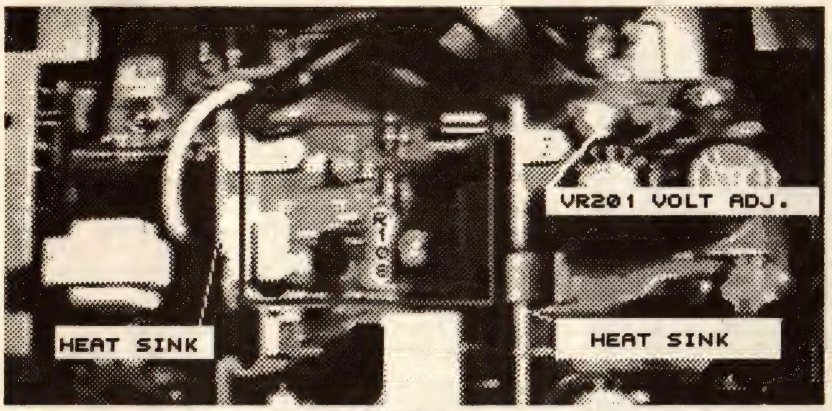

FIGURE 2
THIS IS THE POWER SUPPLY BOARD. NOTE THAT THE RED BOX INDICATES THE AREA THAT THE FAN WILL TAKE UP. CHECK TO MAKE SURE THAT R108 DOES NOT HIT THE BOTTOM OF THE FAN.

I then drilled a hole in the shield large enough to accommodate a nibbler. A nibbler is a device that will cut metal or plastic by cutting small pieces away on a marked pattern. Radio Shack sells one of these too, catalog number 64-823. Other methods of cutting a hole in the shield might include:

A hole punch, proportionate to the fan size
A small coping saw with a metal cutting blade
A jigsaw with a metal cutting blade

Once I cut the hole in the shield, I then drilled 1/8" holes for the screws to mount the fan to the shield. I used 4-40 machine screws to mount the fan. To make sure they don't rattle loose, I put some non-corrosive silicon rubber on the nuts.

One note: I mounted my fan so that when turned on, the air is drawn over the components of the power supply and forced up and out of the computer. So far, this has worked exceptionally well, as I can feel the warm air being forced out of the power supply.

Power Supply Hook-Up

Again, please take caution when working with electricity.

The next step is to remove the four screws holding in the power supply's PC (printed circuit) board. On my power supply, the manufacturer was kind enough to drill two extra holes. These holes allowed me to solder the fan wires directly to the PC board, eliminating the need to "tap" into the existing wires, as this is not really a good idea and takes a lot of the professional look away.

The blue wire is + or positive 12VDC. Just to the left of it is a blank hole. This extra hole is where I soldered in my positive fan wire. The extra hole for the negative wire is located just to the right of C205 (C is for Capacitor) as shown in Figure 3.

I found these power points by disconnecting the plug from the motherboard, plugging the power supply in, and using a volt meter to test voltage output. I suggest that you cautiously do the same to double check that you are receiving the correct 12 volts at these points. If you are uneasy about doing this, I would suggest you have a friend help you who is comfortable working with electricity.

While you are testing for 12 volts, should you find the need to slightly increase the voltage, you may do so by adjusting trim pot VR201. Mine was off slightly, so I adjusted it up about .5 volts.

Once you locate these points, carefully solder the wires from the fan onto the PC board. While you have the solder iron hot, you may want to check

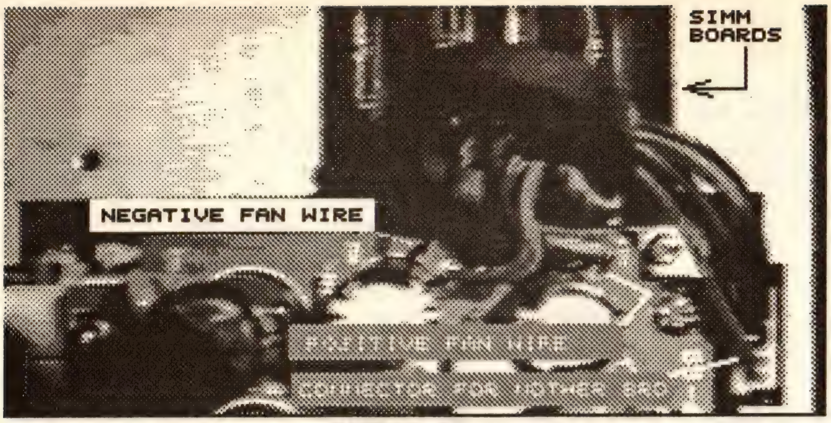

FIGURE 3
THIS WILL GIVE YOU THE GENERAL IDEA OF WHERE TO LOOK FOR THE EXTRA HOLES DRILLED IN THE PC BOARD, AND WIRE LOCATIONS FOR THE FAN. REMEMBER TO UNPLUG THE UNIT BEFORE WORKING ON OR AROUND THE POWER SUPPLY.

the connections on the board for cracked solder joints. I found one and resoldered it.

I found that soldering the fan wires to the PC board, then bolting it to the shield was the way to go. The wires on the fan are long enough to permit this. In case you were wondering, I did route the fan wires through the coil with the other wires.

Installing the Shield

Almost done! Carefully reinstall the power supply and secure it with the four screws. Now, being careful not to entangle the fan wires with everything else, position and mount the shield, attaching the screws to hold it in place.

When I got to this point, I wanted to make sure everything worked before replacing the cover. I plugged my machine into the wall, popped a disk in drive A: and turned it on. It booted just fine, and the fan came to life.

Once I installed the cover, I found the air from the fan was impeded by the venting slots in the cover. Still not wanting to hack and cut on my case, I investigated further possibilities of trimming some plastic, without changing the outside appearance of my computer.

This will be hard to explain, but I'll try. Look at the vent slots. Notice they are cut at an angle. There is a certain amount of plastic that can be trimmed away without causing structural or cosmetic damage. The best way to illustrate this is by the cross section I have symbolized in Figure 4.

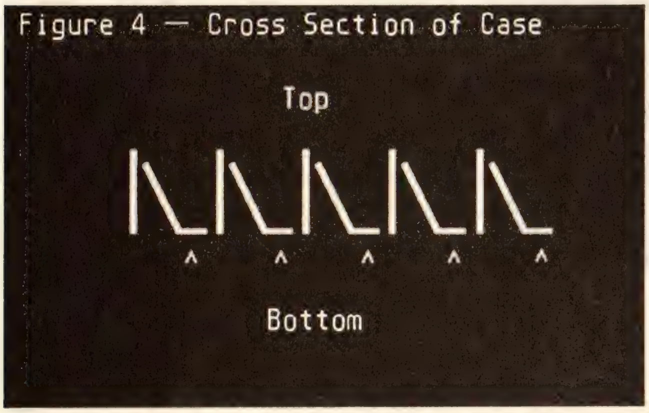

Figure 4 — Cross Section of Case

The symbol ^ indicates the area of plastic to be removed to increase air flow. I used a sharp X-acto knife to accomplish this task.

Once all that is complete, you are basically finished, except for remounting the top case to your computer and installing the screws.

How Well Does It Work?

I have been using my STe with the fan mounted for about three weeks now. The computer is used every day, and is usually left on for quite awhile. I have had no problems at all. I have four megs installed and run VIDI-ST, VIDI RBG and assorted MIDI devices. By running the cooling fan off of the power supply, it has never failed to give the best in performance running all my software and hardware.

This project may be of interest to Sysops who leave their STes on 24 hours a day. Have fun and be cool!

The TAB

Tos Adapter Board

Only $29.95+$3 S&H For 520ST, 1040ST, Mega ST, Stacy

Install TOS 2.06 and Beyond

The TAB is a small circuit board that FITS inside of ANY ST computer and allows the installation of any roms addressed in the E00000-EFFFFF range. TOS 2.06 is addressed at E00000-E3FFFF (256K), so it works nicely, and as you can see, when or if the size of the TOS increases in the future, The TAB will handle it, up to 1MEG.

TOS 2.06 is the new system software that the Mega STE's are using. It has a completely new desktop, including most of the features of the alternative desktop programs, without using up all that ram and without having to boot every time. But that's not the only thing. It also has some much improved system BIOS routines to speed up the system operation.

There is also optional instructions to keep your old TOS in your computer , in case you have some software that is TOS dependant. This is one upgrade that you shouldn't bypass.

AMAZING, works GREAT, I kept 3 TOS's in mine, it was a neat and easy installation, ACTUALLY FITS inside the Stacy, are just some of the comments I've heard from people that have installed the TAB. Not to mention the $50-$65 that they saved by using the TAB instead of the alternative.

Contact your local dealer or : Newell Industries
P.O. Box 253, Wylie, TX. 75098, 214-442-6612

We also have 1 to 4 meg memory upgrades for BOTH the ST and 8 bit Atari computers. Call or write for more information.

STraight FAX from Joppa Software

Patricia Snyder-Rayl

A while back, I reviewed the SendFAX software program from Joppa, called JoppaFAX. Now, Joppa has updated their software to use the Send and Receive FAXmodems available on the market. That's right! All you need is a Class 2 send/receive FAXmodem and the Joppa software, and you're off to the races.

Sending FAXes is a breeze. The old feel of the original software is still there, but the software itself seems to be a bit smarter. As before, you can send FAXes in a variety of ways. You can send them as a graphic (such as .PI3, .PC3 or .IMG), as ASCII text, or as a Calamus or PageStream document converted into STraight FAX-readable form.

This is how I create all my FAXes that I send out. The PageStream printer driver for STraight FAX is included in the package, as is the one for turning Calamus files into FAXes.

When sending a FAX, you have many options. You can send a cover sheet with or without a graphic at the top. You can schedule the FAX to be sent at another time, perhaps when the rates are cheaper. You can even choose to send several FAXes to one person or one FAX to several people.

The STraight FAX software is nothing if not flexible. The setup is very easy, as the installation procedure takes you step-by-step through the configuration choices available to you. You choose what sort of FAXmodem you have, what the default baud rate should be, what the default FAX resolution should be (fine is 200x196dpi), how long to wait for the FAX you're calling to pick up, how long to wait before trying to send the FAX again if the line is busy, and where you wish the STraight FAX software to save incoming FAX files.

How does STraight FAX deal with incoming FAXes? Very well, thank you! Joppa has given you the choice of printing the FAX files (using GDOS) or saving them as IMG files to be imported into programs like PageStream for printing out.

If you have an Atari Laser and GDOS, Joppa has also gone one better and enabled you to make good use of their software. With the Atari Laser, STraight FAX allows you to print multiple copies and reports any errors reported by the Atari Laser.

STraight FAX works equally well with CodeHead Technologies' G+Plus or Atari's GDOS and Font GDOS. While I can't personally verify it, the documentation also claims the software supports FSM GDOS. Unfortunately, Atari hasn't released FSM GDOS to the public.

I've noticed that STraight FAX is "smarter" than its JoppaFAX ancestor when transmitting the FAX files. In the older software, the program would sometimes get confused and spit out an error message if the FAX on the other end would do something even the littlest bit out of the ordinary.

For example, the JoppaFAX software would say there was an error if the receiving FAX machine sent an acknowledgement of receipt of the file or if the FAX simply hung up the phone after getting the end of the transmission. The STraight FAX software seems to understand and accept these variations a bit better.

New Features

Besides being smarter and able to handle incoming FAXes, the software also has a few more features. These include a nice clipping feature to cut out pieces of graphics or FAXes and turn them into files that can be FAXed. Also in the clipping feature is an option to clean up the graphic. This helps remove any spurious dots in your graphic due to transmission quality.

When viewing files, you are able to view the FAX file or graphic in a window at half its size. You can use this half size command multiple times to shrink the viewed file so that you can see a whole page on-screen at one time. This command does not close the previous window, however. So, you find yourself closing several windows after you've done a full page viewing.

Another new feature is the support of scanners. STraight FAX now allows you to use the ScanLite Desk Accessory from Dr. Bobware/Wiz Works! and a compatible hand scanner to save scans as a FAX or an image file. This could definitely come in handy if you only had a hardcopy version of something you wished to FAX.

Pluses and Minuses

On the plus side for STraight FAX is the ease of setup, and the downward compatibility for any old FAXes you created with JoppaFAX. I also like the Popup menus the software uses, just like on the Mac.

STraight FAX is very easy to use, and Joppa has added a lot of new, useful features.

Also on the plus side is how the manual spells everything out for new users and even includes information on what a FAX is, for those more technically minded.

On the minus side, also, is the manual. Someone should have proofread the pages before printing. The problem isn't misspellings or grammatical errors, but the wrong word in the wrong place or unnecessary words left in (i.e., typos). For example, on page 6, the instruction page for installing STraight FAX, the text starts out (my emphasis):

"Before you can YOU the STraight FAX! program to send or receive FAXes, it must first be installed by following THE these steps:"

Now, you can easily interpret what the documentation is trying to tell you, but why should you have to? For the most part, the manual is fine, but these simple errors don't do any justice to the software or the writers.

The other minus is in the way error messages are handled when something unexpected happens at the end of transmission. For example, after a FAX send has been completed, I sometimes get "Error, Remote FAX disconnected unexpectedly" or "Timeout while waiting for remote FAX to send page acknowledgement."

Now, these messages would be fine if they just showed up in the status box. But, unfortunately, the software starts to redial and resend the FAX files, and I have to abort the attempt to resend. I know the FAX was successfully received on the other end. Perhaps if the message came up and you were asked if you wished to try a second attempt, I would be able to live with that. Or maybe even have a Yes or No option in the Preferences like "Resend FAX on Error."

Conclusion

So, there you have my opinions on the Send/Receive FAX software from Joppa Software Development. Overall, the package is very good. There are a few minor blemishes, but these are only skin deep and do not affect the actual performance of the software.

I would heartily recommend STraight FAX to anyone looking for a way to send and receive FAXes via his or her computer, rather than investing in a FAX machine. You need at least a one meg ST, while Joppa recommends that you have a two meg ST with a hard drive.

I'd been using the original JoppaFAX software for a long time, and I look forward to using the updated STraight FAX software for at least an equally long time.

Suzy B's Software

We want you to buy as few disks from us as possible!

Not Really! But why order a PD disk that isn't chock full of the programs and files YOU want? With Suzy B's Software you choose which programs are put on your disk, so that you only get the files YOU want and not those you don't need. We will send you our disk-based catalog (with detailed descriptions of 5,000 files, including file sizes). You decide exactly which files you want and place your order. All you need to do is make sure they will fit on a 720K disk. Most files are self-extracting archives, to get even more on each disk! Now we call that . . .

"A Honey of a Deal!"

Single-sided disks are $5 and Double-sided are only $7 each. Shipping is free. And if you order four disks, your fifth is free! Where else can you get such "a honey of a deal"? Buzz through our nearly "600 page" two disk catalog. Only $2. Call today.

Home Accounts 2

Bill Rayl

In today's environment of huge budget deficits and an ever growing National Debt, people have become acutely aware of just how important it is to get control of their spending.

When it comes to keeping track of your money, it's always best to be organized. As a private citizen, you don't have the luxury of being able to blame someone else for whatever fiscal mess you create. And you certainly can't keep borrowing money from foreign governments or issue bonds to make ends meet.

It's far too common a thing for people, at the end of a given week or month, to say "Where did all the money go?" Using Home Accounts 2 won't necessarily help you keep more money in your pocket—although it can do that—but it will show you where all the money went.

Home accounting packages, in general, keep track of your income and expenses, much like high-end accounting packages do for businesses. Accounting software for the home, however, is generally much easier to use and don't use lots of jargon only CPAs understand.

Home Accounts 2 is a top-of-the-line home accounting package. It has all the bells and whistles you would expect from such a piece of software. Home Accounts 2 is actually powerful and flexible enough for the needs of most small businesses.

Home Accounts 2 runs on any Atari ST or TT in medium and high resolutions. The manual does point out that, while the software runs fine on a 512K system, 1MB of memory is recommended.

The software is extremely easy to set up and use, which is very important since the initial setup stage is always the most tedious for this type of software. When setting up, you define 'accounts' for banking, checking, credit cards, etc. You supply opening balance, warning limit minimum or maximum and type of account (checking, savings, credit card or cash). You also include check number to start at if applicable.

You also define transaction 'types'. For most people, these would be things like Wages, Rent, Car Payment, Food, Gas, Electricity and Phone. Each transaction affects one or more of your defined accounts. For example, Wages might increase the amount in both a savings and checking account.

CA CE CI CL EL FO GA GI HO HR IN LI MI MO PE PT SA TE TR TV WA WH
Types

Example of 3D Stacked Bar Graph

Another benefit of using home accounting packages is that, once set up, reconciling your accounts is a breeze. Balancing a checkbook can be a tedious process, and software like Home Accounts 2 makes it about as easy as possible.

Home Accounts 2 also has the ability to track investments and taxes. Investments are included in your Net Worth report. (More on reports later.)

Taxes

For keeping track of taxes, you can define various tax categories and apply them to individual types of transactions. For instance, you could define Sales Tax as a category and apply it to your in-state purchases (Phone Bill, Rent, etc.). Income taxes can also be tracked in this fashion.

Because Home Accounts 2 has its origins in the UK, it supports the notion of VAT (Value Added Tax) or GST (Goods and Services Tax). In fact, the command for setting up your tax categories is labeled 'GST Code'. Canadian users will find this a welcome addition, as they also pay GST.

No matter what country you're in, Home Accounts 2 should be flexible enough to handle tracking of your tax information.

Regular Transactions

No home accounting package would be complete if it didn't handle regular transactions—those monthly bills we all hate to pay, our weekly or biweekly paycheck, etc.

Home Accounts 2 handles these transactions well. You can enter a starting and ending date for the transaction, how often the transaction occurs (in days, weeks or months), how much to transfer to or from your account and what account you wish the transfer to affect. If you're tracking tax information, the software can even automatically apply the proper tax category to the transaction.

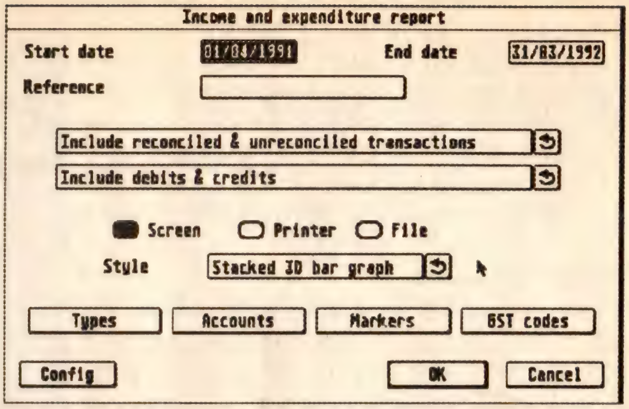
Budgeting

Once you have all your transaction information stored in Home Accounts 2, you can start working on setting up a budget. Here's where a good accounting package can really help you out. Used properly, a budget can help you save money by putting limits on your discretionary spending. By comparing and tracking your spending habits, you can pinpoint areas where you might want to cut back, as well.

With Home Accounts 2, you can set budget items for each defined transaction type. While items like rent and car payment are fairly predictable amounts, setting budget limits for things like gas, movies, books and miscellaneous expenses can help you get control of your spending.

Reports

One place Home Accounts really shines is in its built-in Reports. It has the standard reports you'd expect, like Account Summaries, Budget and Regular Transaction reports.



Income and expenditure report

Start date 01/04/1991 End date 31/03/1992

Reference

Include reconciled & unreconciled transactions

Include debits & credits

● Screen ○ Printer ○ File

Style Stacked 3D bar graph

An Account Statement gives you a report similar to a bank statement while an Income and Expenditure report shows you at a glance where your money is coming from and where it's going. With each of these reports, you have the option of including reconciled and/or unreconciled transactions as well as debits and/or credits.

The Account Statement can be viewed as a standard listing of transactions, much like your checkbook looks. You also have the option of viewing the transactions as a Line Graph or Scatter Graph. The Income and Expenditure reports add the ability to view the data as a Pie Chart or Bar Graph (flat, 3D, stacked, stacked 3D or overlaid). These graphs look especially nice in TT medium resolution.

A Budget Progress report lets you see just how well you're doing at living up to (or maybe down to) your budget. Here you also have the option of

viewing the data as a listing or using the same graphic displays as for the Income and Expenditure report. Using the Pie Chart, for instance, displays a chart for the theoretical budget alongside a chart showing your actual budgetary expenses.

Other reports include GST (taxes), Portfolio (for investments) and Net Worth.

Other Features

Home Accounts 2 has a lot of extras that make the package the best overall home accounting package I've ever used. While I can't possibly cover all of these, I'll highlight of few of them.

Under the General Preferences option, Home Accounts 2 reveals that it has a built-in screen saver and system clock. You can also set the software to automatically save your work periodically and back it up from this dialog.

Printers supported by the package include most dot matrix, inkjet and laser printers, including the Atari laser, Canon BubbleJet and HP LaserJet and DeskJet. You can set the number of lines per page, characters per line and margins.

A Calculator is available for standard math functions. A special Interest Calculator lets you enter opening balance, period, interest rate percentage and payment amount and then calculates the balance plus interest.

For those times when you need to take a break from the budget, click on Playtime and you're off to a game of Space Invaders! You need a color monitor and at least 1MB of memory to use this option within the Home Accounts package. If you have a 512K machine, you can always run the game separately, as it is included on the distribution disk. You can even substitute the game with one of your own favorites; just rename the game to INVADERS.PRG and store it in the directory from which you run Home Accounts.

Finally, if you don't like some of the headings used in the program, even in the drop down menus, you can modify them if you have a good editor (like EdHak from Clear Thinking). All the items used in the program appear in .LNG files. Even the error messages are contained in ERRORS.LNG and can be modified.

You do have to be careful when doing this, however, as any placement changes could have nasty effects. Also, the .LNG files do contain some control characters, and standard text editors or word processors will strip these from the files.

Most people won't want to bother with this level of personalization, but it can be done. If, however, your life won't be complete until you have changed all references to 'GST' in the software to 'TAX', it can be done.

Home Accounts 2 is a great package that should fill the accounting needs of most home users and small businesses. It combines a multitude of features with a very user-friendly interface. The manual is superb and comes complete with Tutorial, Quickstart section, six page Table of Contents and seven page Index.

After using a software package like this, one can't help but wonder if the government might be in better fiscal shape if they were using Home Accounts 2. At the very least, Congress might have bounced a few less checks. (grin)

Don't buy another hard disk!

Why You Should Keep Your 8-bit Atari

Matthew Baker (AAAUA)

Over the last couple of years there have been a lot of articles on the 8-bit Atari dealing with the questions "Why stay with the 8-bit?", "Why stay with Atari computers?", "Why not go with the biggest and the best?", "Why not move to a computer brand that has more support?"...

I felt it was time for me to stand up and say something, so here is another article on why you should hang onto your 8-bit Atari.

I purchased my 130XE back in 1985 when it first came out with the 520ST. Before these computers were introduced I was strictly an Apple person, mostly because that's what I used in school.

I was saving up for an Apple //c when I read an article in Creative Computing magazine on the "new" Atari Corporation. It spoke of a computer dubbed the "Jackintosh." This, of course, was the 520ST.

It offered everything the Macintosh did plus more memory (at the time), full color graphics with a 512 color palette (a lot of colors back then), and was about half the price of a Macintosh.

I was nothing short of amazed. To think that the "game machine" company was up against the big boys with a computer that blew them away. Of course, my budget at the time was still a little short of a 520ST, so I purchased the 130 XE which had all the capabilities and memory of the Apple //c for a fraction of the cost.

At the time, I was unaware of the existence of the 400, 800 and XL computers. I had only heard of Apple and Commodore. But to be able to own a real computer for only $150 bucks blew me away! (At the time I owned a Timex/Sinclair 1000).

I have never regretted buying my computer since. I got the best 8-bit computer that was ever made, and I still feel that way today. My 130XE blew away the Apple //c at every turn—better graphics, better sound, cheaper prices for everything.

And, at the time, it had pretty good support as well. Three magazines—Antic, Analog and Atari Explorer—covered the machine. All the big software companies were producing software for it. Even magazines like COMPUTE! and Byte were supporting it.

Over the next several years, I saw all the major software companies stop producing for it one by one. I watched the demise of Analog, then Antic. Things started looking pretty grim.

Then came along AIM. The first time I saw it was in a Waldenbook store and I thought it was another magazine for the ST because that's what it mentioned on the front cover. Oh well, I thought, maybe I'll glance through it and see what's happening in the ST world. To my amazement there were advertisements and articles in there for my 8-bit!!

I quickly snatched up that mag and proudly went to the counter to pay for it. The dealer had a funny smirk on his face (apparently an MS-DOS man), but I proudly ripped out my wallet and gave him the three bucks and turned up my nose.

Later, I heard about a magazine called Current Notes which supported the 8-bit, then came AtariUser and, most recently, I heard of The New Atari User mag from England and a disk-based mag called Excel from Scotland (which is now magazine and disk). I have discovered a whole new frontier of uncharted software from Europe.

AIM has brought me closer to other 8-bit users through their user group listing, from which I joined AAAUA. There are a lot of authors releasing PD and shareware software for the 8-bit, and this software is as good or better than the commercial stuff.

I believe you get better support with shareware than was ever possible with commercial titles. Consider this; with shareware you can usually get in touch with the author and directly ask any questions you might have... and the author knows the answer, after all they wrote the program.

With commercial releases, you may get support but you most likely end up talking to some company customer service department that will be flipping through the manual or some other book and they probably know nothing of the program personally.

With shareware you're getting a program that was written by a dedicated 8-bit enthusiast like yourself, who put a lot of time and effort into the program so you know it will be top quality for the most part.

Most of the commercial releases are inferior programs ported over from Commodore computers just so the company can make a few extra bucks in Atari land.

With shareware there are extensions and modules or programs to work in conjunction with the original program released by the original author or some other hacker with a good idea. This is not possible (for the most part) with commercial software because of the protection techniques and copyrights.

Finally, with shareware you get to try before you buy so you're never disappointed or ripped off like you can be with commercial titles.

New commercial titles such as P.A.M, ChromaCAD 3-D and Blockaboo (a Tetris clone) are still being released. Software Infinity has a bunch of German titles and K.O. Distributors has some new games.

There are still companies like Computer Software Services producing great hardware upgrades for the 8-bit. PD catalogs have never been stuffed more with PD software. I would say that the Atari 8-bit has never had better support than it does today. Get rid of my 8-bit? *Never!!!*

I would also like to state that I think Atari not only makes good computers, but the quality of the hardware is also excellent. In the 7+ years I have owned my computer I have had to replace the keyboard membrane once. I have never had any other problems with any of the hardware from Atari. I see people with Apples and Commodores and IBMs constantly getting their computers repaired.

You will never find hardware prices cheaper than for 8-bit stuff. The authors out there are keeping our computers in the 90's with programs like ColorView which can display Amiga or GIF pictures with all 256 and even 4096 colors!

Reevesoft is keeping our computers in the 90's with mouse driven graphic operating systems. Get a new computer? Get real! You can even get memory upgrades of 1 meg+ and turbo operating systems. It will be another 7+ years before I give up my Atari 8-bit.

So you want the biggest, the best and the newest machine on the market? Why?

The 8-bit Atari can do word processing, balance your checkbook and keep track of your budget. It can still play games with great graphics (check out some of the new European titles). I can create artwork on the 8-bit with 256 to 4096 colors from a palette of over 25,000 colors thanks to paint programs like Escalpaint.

The Atari 8-bit can still print out great reports and resumes, and it can still plot great four-color graphs. It can still go online on CompuServe or wherever. It can still play four voice music (digitized). It can still tell you how long it takes light to travel from the Crab Nebula, how cold Pluto is at its equator, and how many 200-pound clowns can fit in a Yugo. It can still do just about anything I need it to do.

You want better printouts for your fancy reports? Get yourself a printer interface, Typesetter from XLent Software and an HP LaserJet printer and come out with the quality that the 16-bitters are pumping out.

I know that the newer computers are pumping out information at anywhere from eight to 40+ MHz, and that the 8-bit only runs at 1.7+ MHz, but that's 1.7+ million operations per second! It would take you about half your life to do in your head what your 8-bit can do in one second!

As for me, my computer is fast enough and I can upgrade it to run faster. To hell with IBM, Apple and Commodore. Stay with your Atari. Who cares what Atari Corp. is doing. Just enjoy your 8-bit!

[About the Author: Matthew D. Baker is an artist, journalist, photographer and Atari 8-bit enthusiast living in Ripon, Wisconsin and currently attending Ripon College. He uses a 130XE for art, games, word processing, desktop publishing and balancing his budget. He is a regular columnist (on creating art with the Atari 8-bit) for the (FR)ANTIC newsletter put out by his users' group.]

PABQWK

An Online Mail Reader for the Atari 8-bit

Bill Mims (MACUG)

Being an avid 8-bit user—possibly the only one left in North Dakota—leads me to several problems. The biggest one is that I need to call long distance to BBSes to contact other 8-bit users. I really need to be able to read mail off-line.

After twisting the wife's jaw several months in a row over real high phone bills, I saw a request in the ST conference of a local board to Beta test a mail reader for the XE. Well, being the 8-bitter I am, I naturally responded.

The result, I am happy to say, is an excellent program for the 8-bit that really blew me away—PABQWK! An off-line mail reader that actually works was the result.

Pab Sungenis, the author of PABQWK and AtariLink BBS, is an excellent programmer and deserves a lot of thanks from "die hards" like myself.

Getting Started

How can you get PABQWK? It will soon be on an AIM disk, but you can get it now by calling the Bio-Chip BBS at 701-723-6345 and register on the board. The Sysop (me) will validate you within 24 hours and then the file areas will be available to you! Call back and download PABQWK.ARC from File Area 7 (8-bit).

If you want taglines (more on this later), then look for the file TAGLINES.ARC. This will be your tagline data file; they are a copy of my own personal taglines.

When you get PABQWK and unARC it, print out the docs or use a text reader and read the docs very closely. In the next few paragraphs, I will go into each command in detail and explain not only how it works, but also problems that I have found.

After unARCing you will have several files. If you have a hard disk, you can rename the AUTORUN.SYS file to whatever you wish. It will still run.

I recommend using MYDOS4.5, but SpartaDOS will also work. I run it under MYDOS and have noticed a difference in it from the docs, nothing but a minor problem.

Assuming your local BBS has a .QWK mail Door, the next step is to download a "packet." The packet contains the actual messages you will be reading later with PABQWK.

Startup

DeARC the packet using SuperUnARC version 2.4 (it's the only one that will do it). You must have, at a minimum, the files CONTROL.ID, MESSAGES .DAT and DOOR.ID. Without these files, you will not be able to read anything. If necessary, extract with query and just deARC these files.

These files can also be directed to a subdirectory, as PABQWK supports this. So, if you're on several boards and want to get all your messages at one time, you can do so without unARCing messages from one system and then calling another after just reading one packet.

Running PABQWK

The next step is to boot PABQWK. The program looks for the file CONTROL.DAT. If the file is in a subdirectory or another drive, PABQWK prompts you with the following commands: (A)BORT (R)ETRY (C)HANGE DIRECTORY.

If you get this prompt and your messages have been unARCed to a subdirectory on Drive 1, then just hit return. The directories for Drive 1 will be displayed, and you can choose one of them from the menu at that time.

If your messages are on another drive, just type in the drive number and PABQWK will default to that drive and look for the control data.

After PABQWK locates and loads the control data, the program looks for MESSAGES .DAT. These are the actual messages that you read and reply to.

After the files have been read, the Main menu appears and offers several options. The right side of the menu only works with the registered version. On the left side of the menu, the commands (R)ead, (E)nter, (C)onference read and (Q)uit work in the unregistered version and are pretty self explanatory.

Reading and Replying

Pressing 'R' reads all messages. While reading messages, four items are displayed in the message window. The top section displays the BBS name, city and state from which the messages were taken. The second section displays information such as message number, to, from and subject. The heart of the display is the message block; this is the actual message text. The last section is a display of the name and version number of PABQWK.

Pressing 'R' or 'E' while reading lets you reply to that message. After indicating you want to reply, you get several short command strings. The first being 'To:' and the next 'From:', with the final prompt asking if the message should be Private.

After deciding these, you have the option to use a preformatted text file or to type in your message. After entering the reply, you can edit the message, delete lines, add lines and route mail. To route mail, you need to just retype line 1, leaving two blank lines after it.

Oh, one thing I almost forgot...PABQWK displays messages much like Atariwriter+ does when set to 80 columns. To scroll around the message, simply press the arrow keys.

Taglines

After replying and pressing Escape, another menu appears at the bottom of the screen. This menu has all of the editing commands. You can either save, abort, delete or add to your message.

If you decide to save, then a Tagline option appears and you have the choice of the displayed Tagline, choosing a different predefined one or typing in a custom one. The file TAGLINES.DAT is used to store a list of your favorite Taglines.

The only consistent problem I have found in the software is here. Sometimes the Edit menu will reappear. If this happens, you should abort the message. If you save it again, you end up duplicating the message, which might upset your sysop!

Observations

The registered version of PABQWK allows the righthand side of the Main menu to work and gives you several more options. You can read personal messages, add and drop conferences and view files with these commands. The personal read shows only messages which are addressed to you. While it takes a little time to display them, it is well worth it.

A few more things about PABQWK. First, you should limit your message packets to no more than 1000 messages. Next, make sure that the packets you receive from BBSes are compressed using PKARC. SuperUnARC 2.4 will only work with this compression. (I have heard rumors that Bob Puff is working on a program to unZIP!)

Do *not* include .NDX files in your QWK packet. I believe PABQWK will work on a 1050 drive, however the packets must be extremely small.

I have tested for about two months now and PABQWK works with JETMAIL and CAMAIL Doors. Pab, the author, has also tested it on MaxiDoor. PABQWK requires a 130XE or 800XL with compatible memory upgrade (one that supports the Antic expanded memory mode).

The docs are quite good and really go into detail. A lot of thanks go out to Pab Sungenis on this one. Every 8-bitter left out there owes him a debt of thanks!

PS: If there is anyone else out there needing a Beta tester for the 8-bit Atari, don't hesitate. Let me know and I will be happy to help you out. I can be contacted at: Bill Mims, 120 H Street Apt. 1, Minot AFB, ND 58704, Ph: 701-727-4049, BBS 701-723-6345. Don't hesitate to call or write, but if you call voice please call between 8-9:30 pm CST.

The ATARI XL/XE Commercial Software Drought is OVER !!!

SOFTWARE INFINITY proudly presents the First Major ATARI XL/XE Commercial GAME Releases produced for the North American market since 1987 !! Eleven spellbinding super - sophisticated 1991 GAMES on 9 economically - priced premium quality Disks ! Unveiled to unanimous critical acclaim worldwide, and already Bestsellers in Europe -- now newly enhanced to revitalize your XL/XE ! Every GAME in *SI*'s NEW *KE-SOFT Series* boasts ultra-realistic & colorful state of the art high-resolution animated graphics, outstanding music, and lots of clever surprises. Many also feature digitized speech & sound effects, can save your high scores or give you help-prompts, allow you to skip levels or pause a GAME-in- progress, and provide a user - friendly Editor to create your own new screens. Handsome and comprehensively detailed Instruction Manuals are written in clear, easily understandable English. All 11 superior 64K *KE-SOFT* titles are endlessly entertaining to novice and experienced ATARI GAMErs alike.

$10.50 GAMES
2 or more for $9.50 each !

ZADOR (Mah-Jong)

Turn over all 144 Chinese-symbol tiles on the game board by matching singles to make pairs that are solely connectible by an invisible line (which can't cross any active tiles or be bent more than twice)! 20 high-powered levels.

DRAG

Guide intrepid Drag the Frog past deadly mines, exploding bombs, & falling rocks in a treacherous underground lair, to collect diamonds and escape before his air runs out! Fifty screens of exciting Boulderdash - type arcade action.

SOGON

Navigate your sturdy forklift around the 50 barrier-filled floors of a skyscraper to relocate large crates one at a time to waiting storage bays. Once you've moved a crate to any perimeter-wall or partition, you can't pull it back -- devious!

ZEBU-LAND

Help Zebu engineer the escape of his 3 brothers from a 50-level labyrinthine world of revolving doors and blocked passageways (move wall-segments aside to reveal exits)!

DREDIS

At last -- the unparalleled mind-boggling Commercial ATARI XL/XE version of the arcade champ Tetris! Ultra-challenging puzzle, multiple levels of difficulty, one- & 2 - player modes.

$14.50 GAMES
2 or more for $12.50 each !

TECHNO NINJA

Voyage to a hostile alien world to reclaim your home planet's ultimate source of power! Encounter 10 perilous landscapes on 100 screens. Gain energy, earn up to 8 extra weapons, battle over 50 monsters. Enhanced density disk.

CULTIVATION / CHROMATICS

Two brain-busting puzzlers on one disk!
CULTIVATION: Strategically "cultivate" matching symbol-blocks; push together like singles in the proper order to make pairs & clear your choice of 100 screens on 10 levels.
CHROMATICS: Rotate the hues of blocks falling into a well to place 3 - 5 same-colored blocks together at the bottom; mesmerizing 3 - level Tetris - style contest.

OBLITROID

As the last Star Warrior of Xyros, you must track the evil Tindalos to his underground dungeon and engage in mortal combat! Find special weaponry to survive never-before-seen dangers on 4 Worlds comprising 140 screens. Manual features map and clues. Enhanced density disk.

TOBOT / BROS

Two invigorating arcade adventures for the price of one!
TOBOT: Using his versatile laser gun, our robot superhero must escape a spooky 50 - room castle!
BROS (Super Mario Brothers - inspired): Traverse 8 Worlds with 4 Underworlds each to rescue your brother from a hidden castle overrun by legions of monsters! E-D.

Order 3 or more *KE-SOFT* GAME titles Mixed ($14.50 & $10.50 items together) -- subtract $1.50 from the price of each ! Or collect 'em ALL -- get Complete Set of ALL 11 Original *KE-SOFT* GAMES described above for just $83 !

Great *KE-SOFT* GAMES *DEMO DISK* with playable sample screens -- FREE with any 2 GAME Disks, or $4.00 separately. *SI*'s Large & Spectacular NEW *ATARI 800/XL/XE/GS Public Domain CATALOG*, showcasing the BEST ATARI 8-Bit P-D in North America, is only $2.00, or FREE on request with any 2 *KE-SOFT* GAMES.

SHIPPING And HANDLING is always just $3 in North America and $5 Internationally, regardless of quantity of *KE-SOFT* products ordered. NO State Sales Tax is due.

All Advertised ATARI Software Products are Distributed in North America and the Western Hemisphere by:

SOFTWARE INFINITY
642 East Waring Avenue
State College, PA 16801
(814) 238-7967

Call SI's 24-hour Telephone Hotline to:
Speed-Order by Phone (have your VISA/ MasterCard ready) or for further information on *KE-SOFT* GAMES.

We welcome your MasterCard or VISA (no extra charge), or Bank/ Post Office/ personal/ etc. checks & money orders.

Brand NEW *KE-SOFT* GAME Titles from *SI*
BOMBER JACK -- Superb battle of wits!
ASHIDO -- Ishido for your XL/XE
$10.50 ea. -- $9.50 for 2+ !
PLAYER'S DREAM 1 -- *PLOT* and *SKI RACE* (2 GAMES)
LEVEL DISK -- 35 New Levels for *TOBOT*, 50 for *SOGON*, & 100 for *CULTIVATION* !
$14.50 ea. -- $12.50 for 2+ !

1020 Printer/Plotter Repair

Alan Frazer (PACE-FL)

The Atari 1020 Plotter is an amazing little gizmo for the 8-bit. It prints in color and is capable of jobs that the "big" printers perform, it's just slower. And, they break down with some regularity. Any Atari 8-bit owner usually has a couple of broken 1020s, and most of us paid less than $20 for them new. That makes getting them repaired one of the lowest priorities we have.

I had intended to demo Print Shop for the users' group, and I ran a printout just before I left for the meeting. It messed up about halfway through the print cycle, and I couldn't wait any longer, so I just shut it off and packed it over to the meeting.

Needless to say, the printer had died. It still made quite a racket, but the print head just sailed over to the right side and tapped out a slow, vertical line.

I was mad enough after the meeting to disassemble the unit. It's pretty easy—there are just four screws you can see on the bottom and two more hidden under the front two rubber feet. I pried the rubber feet out with a small screwdriver.

Then, I plugged the unit back in and turned it on. The print head drove back over to the left, but the little squares it makes on powerup were all messed up. After unplugging the printer and tinkering a bit, I discovered the problem. Interestingly enough, it was the same problem on both of my broken units.

The drive motors for the 1020 are under a metal shield behind the paper platen (the thingy that the paper goes around). On the left side, there's a little metal shaft coming out of the metal shield and a little gear is on that shaft. It's the problem.

The gear breaks free from the shaft and no longer drives the print head properly. The solution was simple: I glued the little gear back onto the shaft.

The simple solution got a little more complex, because I needed to put the print head in the right position for the printer to work properly. I discovered that the print head can be pushed over to the left side, with the pen just slightly to the right of the little brass drive sprocket (it has little tiny teeth that move the paper).

The print head only goes so far, and then it seems to "snap" into place. The little gear on the shaft spins such that you can move the print head. If not, slip the gear over to the left with a pair of needle-nose pliers, and try again.

With the print head back into position, push the little gear back over to the right so that you get some friction on the shaft and the shaft doesn't spin inside the gear.

Now, turn the printer back on (you did have the power off, didn't you?) and see if you positioned it well. If the print head spaces the powerup boxes out too far, you've started out right. Let the powerup cycle finish, turn the printer back off and reposition the print head again. Then, put a drop of SuperGlue on the spot where the shaft and gear come together. I let it dry an hour and then put on a second drop and let that one dry for 24 hours.

After letting the glue set, turn the 1020 back on and watch it work again! It's a great feeling. But, if it is still out of line, don't fret. Using a razor knife or sharp pocketknife, scrape as much of the glue off as you can. Then take a pair of needle-nosed pliers around the shaft loosely, and push the gear off to the left. It'll probably pop off completely.

Scrape the shaft off or wipe it off with a swab and some fingernail polish remover (this stuff melts plastic, so be careful!), and when everything is clean and dry, start over. You'll get it.

To make a real mess of things, I drilled a 1/2 inch hole just above the gear in the plastic case. The plastic shield covers up the hole almost completely, and if you're careful, the hole will look like it's supposed to be there. I put the hole there to help line the print head up with the unit assembled, and then drop the glue onto the shaft through the hole.

Sounds like a lot of work to fix a $20 printer, but after the repair my 1020s have pounded out a number of documents, including Print Shop "posters." And, if you've ever seen the 1020 work with Print Shop, you'll understand the workout it gets. Good luck, and remember: if it's already broken when you try to repair it, how can you hurt it?

THE GOOFY GURU

At Last, A Use for DOS 3!

Charles Kelly (PACE-MN)

[Permission for use/reprint of this article is given only on the condition that the notice at the end of this article is included.]

The Goofy Guru has followed the same format in all of his articles of off-the-wall problem descriptions, instructions, and explanations of where and why his observations are a little different but workable. But this is really weird—actually *use* DOS 3?

Actually, you are only going to use DOS 3 to format disks which you have doubts about before you discard them. Take any of the bargain disks that you have doubts about and boot up with a copy of DOS 3. Now format with DOS 3. Then, boot up a *real* DOS and format the same disks normally. You will find much of your black plastic trash turns into useful disks.

The reason questionable disks become usable after being formatted with DOS 3 has to do with the very problems that made DOS 3 such a failure. Sector maps with DOS 3 lump eight 128 byte sectors together so that your disk storage is divided into 1024 byte (1K) blocks.

During formatting, the drive head stays in contact with the disk longer and drives the initial write signal longer. The drive does not have to stop to update the initial link information as often. The signal continues for eight sectors and not just one.

Keeping the head down under DOS 3 gives the extra little bit of "polish" that is often omitted with cheaper disks. The bias signal also continues between sectors, so that more magnetic noise is erased between sectors.

Your drive may not be able to erase very loud noise on a disk otherwise. Unless your disks are carefully bulk erased at the factory, or preformatted, you are going to have this noise. Get rid of the noise, by formatting under DOS 3, and you should have a good disk.

So the next time that 20% of your purchase of bargain disks seems headed for the trash (or sent to the neighbor with the Apple II or IBM clone as a joke in very poor taste), try this step first. DOS 3 is pretty useless otherwise. I had to find out far more than I wanted to about DOS 3 to explain why this trick worked.

[The Goofy Guru series originated in the pages of the Southern Nevada Atari Computer club and continues to irritate all. Current club affiliation is with PACE of Duluth MN. Everybody else asks for donations these days (I break things too) so I live at 125 N. 1st ave W., Duluth MN 55802, and...well...I prefer short redheaded women most of all! Another address to send donations (please!) is 4835 Crosley Ave., Duluth MN 55804-1219. A $7 donation will send you a SSSD disk with the complete Goofy Guru series to date.]

Atari Classics
The Magazine For Dedicated Atari 8-Bitters
announces the kickoff of its official
Subscription Drive at the

WAACE AtariFest
October 10-11, 1992
Reston, Virginia

Keeping It Organized With The Portfolio

Marty Mankins

To know what kind of person I am, you need to understand one of my biggest disadvantages in life: a seriously impaired short-term memory. If you tell me something, there's no guarantee that I'll remember it in five minutes. But, if I write it down immediately, I no longer need to worry about my short term memory effect.

Or do I? One week goes by, and now I am searching for that paper I wrote that important note on, and I can't recall where it was last placed. So, now I am back to square one.

Does the above sound familiar? I've talked with several people whose short term memories have failed them on many an important occasion. Well, those of us who own the Portfolio have no need to worry anymore. We always know where the Portfolio is (or at least we should), and we can keep lots of information in it. And, with a few keystrokes, we can retrieve the information for examination.

In this article, I hope to show how the Portfolio can be a great replacement for our often failing short-term memory.

Backups Should Never Be Forgotten

To those that are not familiar with the MS-DOS functions of the Portfolio, I can make one suggestion that should never slip your mind—*backup often!* This is something that should be done daily, especially if you're making several entries per day.

Since the Portfolio is going to be used by you as an information gatherer, and we've already determined that short term memory is too short, it pays to backup often. For those with an ST, Mega ST or TT, may I suggest TransporT, a program from Artisan Software made for the transfer of files to and from the Portfolio and ST line. You'll also need the Serial Interface from Atari and a null modem cable.

Things To Do

You should start now to make a habit of keeping a To Do list. If this system is going to work, you'll need to make it second nature. The old rule says that if you do something at least seven times, then it's a habit, bad or good. Well, starting out with the Portfolio may take a little longer, especially if you are new to it or trying to convert from keeping your To Do list on paper.

And while we are on the subject of paper, if you already have a certain way of doing things, then find a way to implement it on the Portfolio. For example, if you just write down your daily tasks on a piece of paper in no particular order, then just typing them into the Portfolio's built-in editor would be the best and easiest way to convert to the Portfolio. You get the idea.

Getting Creative

As was discussed above, you could use the built-in editor to write down all of your tasks. Lots of people use this method and it's a great way to convert to using the Portfolio for keeping your list. But, there are more ways that are just as easy to keep a To Do list on the Portfolio. One of my favorites is using the Address book program (also built-in).

You may already keep names and phone numbers in several ADR files. If so, then you already know how to use the program, but there's more to the program.

Priorities First

There's a hidden feature in the Address book that makes keeping items prioritized a breeze. By entering a number at the beginning of your task, the program sorts your entries to allow all the 1's at the top, all the 2's next, and so on up to the number 9. You could use a 10, but it would sort next to the 1's.

Let me give a quick example. Say you want to enter a task like *'Take Out The Trash'.* You will want to make this a high priority item, so at the beginning of the text, type in the following: 1 - . Make sure you add the space after the hyphen for proper sorting.

OK, now enter another item. To do so, press F1 (or the red Atari key) and choose Cards, then press I for Insert. Now enter the next item: 2 - *Cut Down Weeds In Yard.* Notice I added a 2 in front of the item. This item is not as high a priority as the first, so it will sort after the 1's.

You can also add a note to each item for clarification of any additional instructions to complete the task. As you add more items to the list, you can see that this is much better organized than just a simple list, although just as effective. And it's very easy to add new items that are sorted by priority. Make sure you save your file every so often. I call mine TODO.ADR.

Now let's add a small twist for looking up your items. Say you have 15 things you have to get done. It can be frustrating to see all 15 items every time. So, press F1 (or the red Atari key). Choose Cards and then Select. A dialog box is brought up with the cursor awaiting your entry. Type in: 1 - and press return. Now, all you see are all the Priority 1's. It makes for a unique search if you include the spaces and hyphen. If we had just used the number, any item that had that number in it also would have been displayed. Now you can see why we added the hyphen and spaces.

Conclusion

It's that simple to keep a To Do list on the Portfolio, and we didn't have to purchase or add any external programs. But, there are programs that you can try or buy. Hyperlist is a commercial outline-based database that can be used to keep a task list. Also, there is a program called LISTER on CompuServe's APORTFOLIO Forum. It's small and its files are compatible with other Portfolio programs. So, get started with the Portfolio and you'll soon find yourself using it for more than just keeping a To Do list.

About the Author: Marty Mankins is the publisher of Take It With You, The Newsletter for Palmtop Computing. He is also a Sysop in the APortfolio forum on CompuServe. He can be reached at [75300,1770].

Take It With You™

The Newsletter for Palmtop Computing

Providing the best palmtop coverage in the industry, Take It With You is published bi-monthly with articles covering most palmtops. You'll find help and tips on the Atari Portfolio, HP 95LX, Psion 3, Poqet PC, Casio B.O.S.S., Sharp Wizard and others as they appear. A wide selection of coverage and topics regarding each palmtop appears each issue.

To Order, Mark The Appropriate Box And Send The Correct Amount

☐ Yes, Place my order for One (1) year of Take It With You. I am enclosing a check, money order or cashier's check for the amount of Eighteen Dollars ($18), which will include Six (6) issues of the best coverage on palmtops, every other month.

☐ Send me more information on the newsletter and palmtop computing

ST/TT Disk

All files on this disk are created with Double Click Software's Self-Extracting ARC program DC SEA! To use these programs, simply double click the files. Then, click on Extract and select the drive/folder to which you want the extracted files saved. Click on Verbose to get a list of the files in each archive or Exit to abort.

Here's a short description of the files on the Sept. '92 disk. For more complete docs, see the text files contained in most of these archives.

ALPHA.APP—Alpha, The Name Generator. Still haven't chosen a name for the new baby? Tired of using wimpy names in your D&D games? Here's a neat utility that creates lists of names, thousands of them! Use your own custom parameters. ST monochrome.

PHOTOCHR.APP—Photochrome is a program that emulates a color board on any Atari ST or STE (TOS 1.62 or previous). It out performs the infamous HAM and HalfBrite displays on the Commodore Amiga. Load most IFF formats, 24-Bit QRT and REAL-3D Raytraced screens (16 million colors) and VidiChrome digitized 'RGB' color separations (4096 colours) before converting to one of six powerful screen modes. ST/STE only. Low resolution color.

CRACKLDW.APP—A little program that "cracks" the password used by LDW Power to secure your spreadsheet files. Great if you protected your files and forgot the password!

DATALOPE.APP—Data-Lope 1.1 combines an addressing database with a flexible envelope printing program for the HP DeskJet. Data-Lope can import CardFile .DAT files so you won't have to retype addresses if you have this program from Gribnif Software. Runs in all resolutions.

FASTBASE.APP—A UK Shareware relational database package with a number of very powerful features and an excellent user interface.

G_MAP.APP—Presents a graphic map of the data on your hard drive. Lets you know how fragmented your data is, and if de-fragmenting would be useful. From Beckmeyer Development.

KRASKA.APP—Kraska (Russian for 'color') is a full-featured fractal graphics generator that's fast and has lots of options. If you're interested in fractals and Chaos Theory, you'll find this program to be quite interesting. Freeware from the UK.

MACREAD.APP—MacRead is a TOS-based program to transfer Macintosh files from Mac HFS disks to the ST. This is an early version of the commercial program MacSEE.

MATHFACT.APP—Math Facts is a math worksheet generator for grades 1-9. Very useful for teachers to generate math tests and review worksheets. Also great for home use for kids who need extra practice on their basic math skills. Math Facts also generates a grade sheet for the teacher or parent, making grading easy.

MORSE.APP—A Morse Code trainer, configurable in speed, tone and practice contents. Can also translate into Morse Code. Freeware. TT Compatible using 24BIT.PRG only. ST Medium and High Rez.

SCRLFIX.APP—Fixes the double-click scroll bug in all versions of TOS since 1.4. Similar to Codehead's BUTTNFIX, but works with TOS 2.06/3.06 as well. Assembly source code included.

WINEMAKE.APP—A wine making database, containing several recipes and other info needed for the production of wine. From the UK. TT Compatible using 24BIT.PRG only. ST monochrome.

Mac/Spectre

Each AIM Mac/Spectre Disk of the Month is a double-sided disk packed with some of the best PD and Shareware programs available each month. The disks are available in either Macintosh or Spectre formats. All files are self-extracting Compactor Pro archives. Just double click to extract!

Here is a short description of the files contained on the Sept. '92 Mac/Spectre Disk of the Month:

Calculator II—Everything you ever wanted in a calculator and more. That pretty well sums up this application. Both System 6 and System 7 compatible!

Compact Pro Package—The latest version of Compact Pro, which is fast becoming THE archiving application of choice in the Macintosh world. This new version is faster and even more stable than before.

FlashWrite II v1.1—A replacement for Apple's Notepad DA, and what a replacement it is. You can import text, copy, paste, change fonts and print all from this one utility. Great for keeping notes on your computer.

FontPrinter—This application scans your system for all installed fonts and then prints out examples of each font. It works very well with Adobe Type Manager and regular Type 1 fonts. The application also supports True Type fonts.

MacBartender v2.5—Okay, all you drinkers out there. Don't say I didn't warn you. By the time you try out all the drinks in this HyperCard (v2.1) stack, you won't even be able to see the monitor. (Note: AIM does not advocate the use or misuse of alcohol.)

DISKS OF THE MONTH

Disk

Metasphere—Just a cute little puzzle application for you to play around with.

Recycle—Do your civic duty and have fun at the same time. The object of this game is to seperate different recyclables on a conveyor belt at a recycling plant.

Spiro—This application is a lot like an old program called Spirograph. It creates beautiful geometric shapes from circular patterns. There are controls that affect the shape and complexity of the output. Patterns can be printed out.

UnScrolly—You've got so many inits and CDEVs in your System folder that you can't see them all at once? Well, your troubles are over. With one click, you can change those icons in your control panel into CDEV names. With another click, you can change them back. Very handy!

WindowShade—This CDEV/init allows you to roll up your windows into the menu bar. This is very handy if you use MultiFinder and need to move some windows out of the way. Just double-click once on the menu bar to roll up the window. Double-click again to roll it down.

Readers can purchase these disks from their local AIM participating user group or by sending $6 ($5 +$1 s/h) per disk to Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108, or call (313) 973-8825 and have your Visa or MasterCard handy. Please specify the Sept. '92 ST, Mac or 8-bit Disk when ordering. When ordering the Mac/Spectre Disk, please indicate Mac or Spectre format.

8-bit Disk

Each AIM 8-bit Disk of the Month is a single-sided, single density "flippy" packed with software. To extract files in the ARC format, you need the UNARC .COM utility. To decompress files with a DCM extension, you need DISKCOM3.UTL. Both programs are available from most BBSes, user groups or you can purchase the April/May '91 AIM 8-bit Disk.

Here's a short description of the files on the Sept. '92 8-bit disk:

ADOS.ARC—The Atari to PC Disk Emulator. One program allows you to use the memory inside an IBM PC as two SS/DD disk drives and 64K printer buffer while another program copies files from these "Ramdisks" to real Atari disks.

SDOSREAD.ARC—SpartaRead lets you read SpartaDOS formatted DD disks directly on an IBM PC. This program runs on an IBMi.

CROSFIRE.DCM—Desert Crossfire, a shareware strategy wargame from Outland Quest Software. The object of the game is to destroy your opponent's base before he gets yours. Use your jet fighters, boats, cannons and SAM missiles wisely! Boot with BASIC enabled.

MLTMOUSE.DCM—A set of machine code routines/programs for mouse, joystick, touch tablet or trackball in your own programs. From the LACE user group in England.

SUPERB30.ARC—Superb 30 is a picture printing utility with many options to manipulate pictures before printing. A number of printers are supported.Written by Trent Dudley.

XEP80G.ARC—The XEP-80 Graphics Handler Demo by Jean Goulet. Consists of the graphics handler and a BASIC program to demonstrate the handler's capabilities. XEP-80 required.

Here's a short description of the files on the August '92 8-bit disk:

MANDEL.ARC—An excellent Mandlebrot fractal generator written by Douglas Skrecky. Includes full docs and the ability to save and load your fractal creations. UnARC to a disk with DOS on it, then reboot with this new disk in the drive.

SNAPSHOT.ARC—Snapshot is a juggler/switcher that allows you to have two "virtual systems" in your computer at one time. Run a word processor in one snapshot area and a game in the other. Includes versions for SpartaDOS and Atari DOS/MyDOS. Written by Tom Hunt. (See the Power User column in this issue for more on Snapshot.)

SNHD30D.ARC—A version of Snapshot specially designed for hard drive users. Have up to 10 different snapshots available at the touch of a button! SpartaDOS compatible only.

DSKWEAVE.ARC—DiskWeave is an incredible utility that increases sstorage on DOS 2.0S disks by up to 60 percent! Docs included.

EASYFIND.ARC—A menu driven indexing system similar to a card catalog found in a library. EasyFind can search for and select only certain records, and you can output selected records to screen, disk or printer.

EASYSTOR.ARC—A menu driven program for entering and modifying EasyFind index records.

EASYTURB.ARC—A Turbo BASIC compiled version of EasyFind. EasyFind Turbo runs on XL/XE machines only, but is much faster than EasyFind.

THINK.ARC—Think is a Tetris clone from Douglas Skrecky. A MUST HAVE for Tetris fans. Supports skill level settings to make the game easier or harder to play. Action! source code included!

ATARI 8-BIT

SOFTWARE - PARTS AND BOOKS FOR ATARI XL / XE & 800/400 COMPUTERS

1050 MECHANISM

Factory fresh TANDON mechs. make difficult repairs a snap. Units are complete with Head, Stepper, Spindle motor, belt etc. Just plug in, no difficult alignments or adjustments required. $39.95

POWER PACKS

Exact replacement transformer for 800/400, 1050 810, 1200XL, 850, and XF551 units. Part #CO17945. $14.50 ea.

XL/XE SUPPLY

Power Pak for 800XL, 600XL 130XE, 65XE & XE Game. $25.00

KEYBOARDS

New and complete subassembly. Easy internal replacement.

130XE/65XE	$35.00
800	$40.00

DELPHI--The affordable online solution!

DELPHI's 10/4 plan sets the standard for online value:
4 hours for only $10, for all the services you want!

✓ Thousands of Atari-specific files to download.
✓ Chat lines with hundreds of participants.
✓ Worldwide Internet and electronic mail.
✓ Hobby and computer support groups.
✓ Multi-player games.
✓ Local access numbers in over 600 cities and towns.

Trial Offer: 5 hours for $5!

Try DELPHI at $1 per hour. Join today and get five hours of evening and weekend access for only $5. If you're not satisfied, simply cancel your account before the end of the calendar month with no further obligation. Keep your account active and you'll automatically be enrolled in the 10/4 plan for the next month.

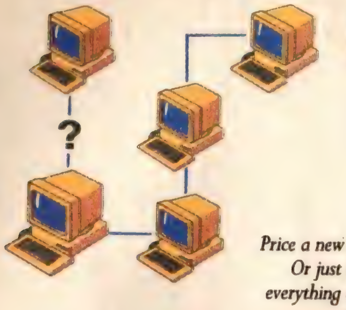
1. Via modem, dial 1-800-365-4636.
2. When connected, press Return once or twice.
3. At *Password*, enter `IP26`.
4. After you get your account, visit DELPHI's Atari Advantage, by typing GO COMPUTING ATARI.

Questions? Call 1-800-695-4005.

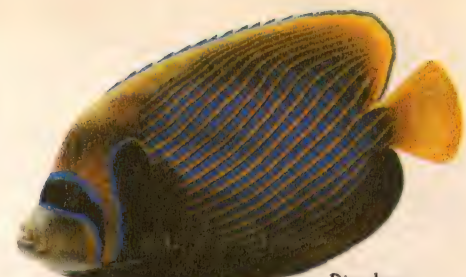
DELPHI

DELPHI is a service of
General Videotex Corporation
1030 Massachusetts Avenue
Cambridge, MA 02138-5302
(800) 695-4005 - (617) 491-3393

Find out why your PC won't talk to your LAN. And what you can do about it.



Shop. But don't drop. Need a 100% cotton pinpoint oxford shirt with button-down collar? In ecru? Try on our Electronic Mall.®

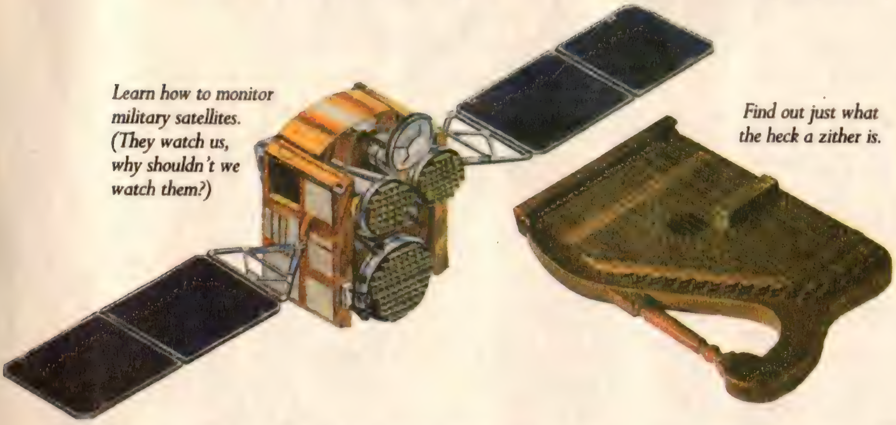


Price a new Mustang. Or just learn everything about it.

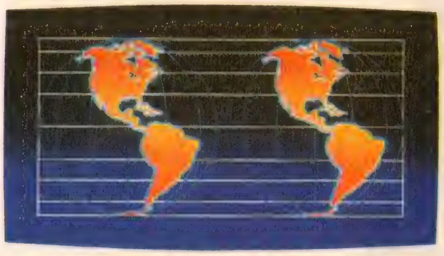
Dive deep into aquarium lore. Like whether a canister or protein filter is better for a 110-gallon salt-water tank.

Finally, a computer information service you can't outgrow. No matter how hard you try.

Learn how to monitor military satellites. (They watch us, why shouldn't we watch them?)



Find out just what the heck a zither is.



Talk to twice as many people about parallel universes.

No matter what you're into, you can get more out of CompuServe.

You can range widely over a list of services that will help you, entertain you, teach you, and challenge you. Or delve deeply into your favorite topics, learning (or even teaching) more, meeting experts, and making friends with people who share your interests.

CompuServe lets you do everything from keeping in touch with our communication services, to getting advice from online hardware and software experts. It's the one computer information service you won't outgrow.

But you will have a good time trying.

For a low one-time membership fee and $7.95 a month, you can use our most popular services as often as you like: news, sports, weather, shopping, reference materials, our electronic mail service of up to 60 messages a month, and more. Plus, there's a whole universe of other, extended options available at nominal additional charges. Your first month on CompuServe will be free, and we'll give you a $25 usage credit to explore our extended services.

To buy a CompuServe Membership Kit, see your computer dealer. For more information, or to order direct, call 800 848-8199 (614 457-0802 for international inquiries).

CompuServe®

The information service you won't outgrow.

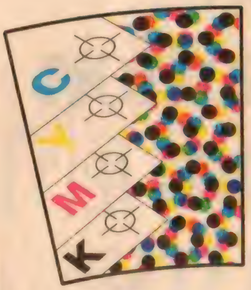
WHAT YOU NEED IS WHAT YOU GET

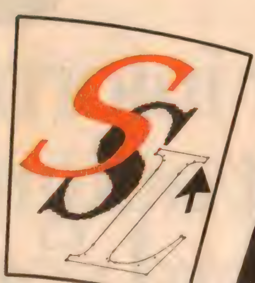
Color separate with full UCR and gamma control, specify accurate line screens, edit and modify 24-bit images in CYMK, create and edit color vector art and text effects, autotrace and translate graphics from one format to another… Calamus SL's own proven outline font technology, gives you, 100% true WYSIWYG. With Calamus, what you see on your screen is precisely what you get.

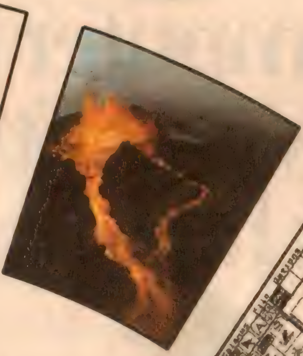
Calamus SL uses the Atari TT 68030-based CPU, loaded with 36 megabytes of RAM. Graphics coprocessors and cache memory make for fast screen redraws. LAN support allows the easy transfer of files from other platforms. This union of sophisticated high-value hardware and software is what Calamus SL is all about. Serious pre-press power at a realistic price while allowing easy addition of new capabilities as you need them.

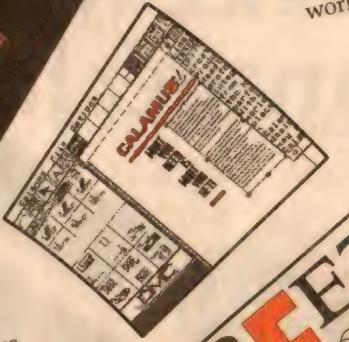
Calamus SL…
What you NEED is
what you GET!

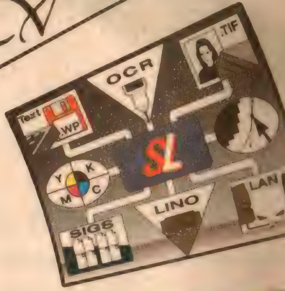
This page was produced and color separated entirely within Calamus SL, using an Atari TT workstation.











Calamus SL is the new WYNIWYG desktop publishing environment, *what you* NEED is *what you* GET. Our fully modular DTP environment allows you to customize your publishing needs to suit your specific application or budget.

The core of the system is Calamus SL itself; our sophisticated, modular, page layout and design program. Calamus SL has accuracy to 100,000th of an inch, magnification to 99999%, 360° rotation of frame elements, Focoltone color support and much more. Calamus SL modules expand the core program into a fully integrated pre-press environment.

Our "Printer 1:1" feature lets you kern text or manipulate graphics dot for dot at the resolution of your output device. Add to this thousands of quality Agfa Compugraphic®, Berthold®, ITC®, Letraset®, Linotype® and URW® fonts currently available and you get remarkable control over type, layout and design! Calamus SL is the perfect front end for micro imagesetters like the Linotype-Hell BridgIt® or Ultre Setter.

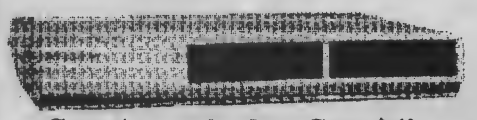
TEC Mega bus- $155
TOS 2.06 - $70
TC Power (for IBM emulators) - $39.95
Trackball(Kraft)- $59
Trackball(cordless)- $88
Turbo 25- $279
Tweety Board - $30.95
Vidi ST - $124.95
Vidi-Chrome ST - $34.95
Vidi RGB - $109.95
Vidi Color Kit - $259.95
Xwitchit(monitor switch) $32
Z-Keys (use IBM keyboard) - $59.95

New Catalog

disk based ST software catalog over 2000 products..... Its on GENIE (CATALOG.ZIP) Or Call and get yours Today!!!

Complete assembled unit, using *ICD ADSCSI Plus / ICD ADSCSI or Supra* host(w/clock) and software, hard drive, SCSI cable, and fan! *Ready to plug in and use.* . All units have a one year warranty. (Syquest & Quantum drives 2 years). All available for 220V 50HZ.



Case A: our budget Case $69

Case B: our shoebox Case $89

3.5"H x 15"W x 15"L

Case C: our deluxe Case $119.95

HD Size	Case A	Case B	Case C
42Megs	$342	$362	$392
85Megs	$442	$462	$492
127Megs	$522	$542	$572
130Megs	$557	$577	$607
170Megs	$582	$602	$632
240Megs	$742	$762	$792
330Megs	$1069	$1089	$1109

Word Processing Tips for Search & Replace

Michael Bennett

> **These are just a few practical ideas on how to use the search and replace function in a word processing program.**

Word processing programs have been identified as the only category of software that almost every computer user owns and makes use of on a regular basis. Whether they are published and marketed commercially or public domain/shareware programs, word processing programs are among the most useful to the typical computer user.

One of the nice things about a word processing program is its ability to search for and replace specified words or phrases. Though each WP program has its own set of commands, there are some general principles that can apply to any program. Keeping these points in mind may help you as you compose those reports, papers, essays or novels.

Search and replace (sometimes also called cut and paste) can be done selectively or globally. A selective search and replace allows you to specify a word or phrase to find in your document and then replace it on an individual basis. A global search and replace replaces every occurrence of a specified word or phrase automatically throughout the entire document.

If you have to search for the occurrences of a particular word, but do not wish to change it, try using just the search function. You have to specify what word(s) to look for, but using this method can be much faster and more accurate than scrolling through a long file.

WP programs can serve as simple databases utilizing the search function. Just enter the name of the person you are looking for as the search phrase and let the computer find it for you. But if you can't remember the name, you can enter any piece of information and the search function will find that person's record. It may find others, too, but just keep going until you find the one you want.

You can also use the search function to find sections of a file which you previously marked. Use a character that you don't normally use (such as *) and type it before the section you wish to mark. Then, when you're ready to find it again, search for that character. The cursor will be moved to each section you marked.

Another use for search and replace is when you wish to underline (or imbed any printer-specific codes into your text). If you use more than one printer and they require different codes for underlining, search and replace can quickly modify all your embedded underlining commands.

As an example, I use the normal underline command in my word processing program with my Star NX-1000, but when I use those same commands with the Atari XMM-801 printers at school, the underlining has gaps in it. So, if I have to print out a document on the XMM-801 all I do is look up the starting and ending underlining codes in the manual, search for the standard underline commands in the document, and replace them as needed.

But suppose your word processor's underline commands are the same for starting as for halting underlining (such as TextPro and SpeedScript—they both use SELECT-u before and after text to be underlined)?

No problem if you want to replace those commands with specific codes for double underlining or italics or whatever. To replace the starting command, specify the search word as a blank space followed by the command. The search specification for the ending command would be that command followed by a blank space or punctuation (you may have to do it multiple times to find all occurrences both in the middle and at the end of sentences).

Search and replace may also be used to delete words or portions of words in a file. Suppose you had typed "Donald" throughout a document, but wish to change it to "Don." Use the global search and replace function and search for "Donald" and replace it with "Don." The "ald" magically disappears.

Another shortcut in writing is to avoid typing long and repetitious words or phrases. Suppose you are writing about blood pressure and have to use the word 'sphygmomanometer' a number of times. Instead of typing it twelve times, just type something like ' SP '. Then, when you are finished use a global search and replace to replace ' SP ' with ' sphygmomanometer '.

Note the spaces surrounding the words above. When searching for individual words, be careful to include a blank space before (and possibly after) the word. Here is an example of what could happen if you don't. Suppose you want to replace the word "be" with "become." If you do a global search and replace, you would not only replace all "be"s that are by themselves, but also all the "be"s in words such as "beyond" and "lobe." They would then read "becomeyond" and "lobecome," respectively. By putting a blank space before (and after) the word(s) to be replaced and the replacement word(s), this pitfall can be avoided.

Many of the Atari 8-bit word processors have only a 40-column display. Though this isn't ideal for typing tables or columns of data, tab maps can be set up to make this task easier.

First figure out exactly where you want the columns and space over to that point on a blank line. Then, type an unusual (and unused in your table or data) character (like * or +). Finish by spacing over to each new column and typing that same character. Then, delete that line with the delete (or block delete) function.

Set the search word/phrase as the unusual character you chose. Restore the deleted line every time you need the columns and press the appropriate keys to find the next search word/phrase. The cursor will glide along to each new tab position and your columns will line up nicely when the document is printed out. It sounds more complicated than it really is. Practice doing it a couple of times and you'll soon become proficient at it.

These are just a few practical ideas on how to use the search and replace function in a word processing program. I hope they have been helpful for you and that using them will make your word processing tasks easier.

Printout Quicker With

OutBurST! 3.0

Now with Auto-switch Spooler!

OutBurST! the printout speed-up now optimizes all of your printing. Auto-switch printer spooler allows you to automatically use the speedup of OutBurST! for graphical output applications or a spooler for text output applications. Works with all parallel printers but especially effective with HP Deskjet and LaserJet compatible printers. Speeds up PAGESTREAM, GDOS, Calamus 1.09 and other printing. ST/STe/TT compatible. Why wait any longer than you have to for a printout? Get it as fast as possible with OutBurST!

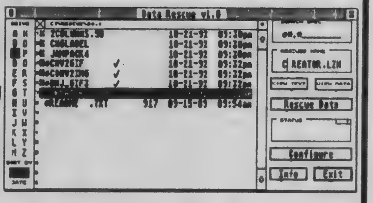
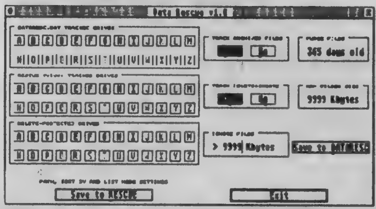
Data Rescue
from the author of Data Diet

NEW SOFTWARE PACKAGE!

2 **REALTIME** user-configurable Delete Tracking modes
- **DAT** tracks deletions by using a small data file.
- **RESCUEfolder** is a trashcan system which moves deleted files to \RESCUE, with each folder intelligently maintained.





- Partial data recovery option.
- Fragmented data easily rescued.

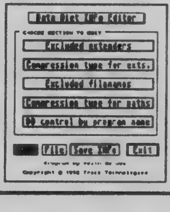
A specialized solution, not just another feature.

Available now for
ONLY $59.95!

Data Diet v2

NEW VERSION!

Some new features: [Shipping Jan 1993 - MSRP $89.95]
- Improved compression speed & percentage.
- 3 new INF sections, including the automated control of Data Diet on-the-fly.
- DDINFOED - DATADIET.INF editor. Very simple to use. No more text editors!
- VRODISK - Virtual RO DISK drive greatly speeds up access to RO files- ie fonts.



Data Diet INFo Editor
Excluded extenders
Compression type for exts.
Excluded filenames
Compression type for paths
DD control by program name
File
Save INFo
Exit

NEXT NEW PRODUCT

SQUISH II
Available 1st Quarter 1993

- Faster compression.
- Greater file reduction.
- Same excellent standard of compatibility and ease-of-use.

Atari is Dead

Tim Holt

Atari is dead. To the surprise of very few, the Atari computer company, as a viable alternative to the Macintosh and IBM/MS-DOS computers, died in its sleep last night. A few relatives were at the company's side the night it passed away, but many former friends were nowhere to be seen when the venerable old man passed away. Authorities say the cause of death appears to be "natural causes," but close friends have repeated stories of depression, dementia, and general failing of health in the last few years of life. Atari was preceded in death by its brothers Osborne, Sinclair, and a host of other "first of its kind" computers that captured the attention of the computing public for a short period of time, but were unable to generate interest outside a few die-hard users. Funeral services are pending, as no one has stepped forward to claim the company as their own. 1972-1993. Rest in peace.

Those were hard words to write for me. I have lived, breathed, and worked on Atari computers for most of my "computer life," but I think it is time we, as a computer group, finally make the hard choice and proclaim the computer dead. We must now get on with our computer lives. We can always have a place in our hearts and memories for our "first love," but times change, the world changes, and, as Darwin pointed out, those that cannot adapt will eventually die. Atari is dead.

Here is the evidence that rigor mortis has set in on the body:

Who writes programs for your computer? Does Microsoft write for Atari? Does WordPerfect? How many major applications on the Macintosh or MS-DOS line actually make it to the Atari? Very few, if any.

Granted, the people that have stuck with the Atari line are VERY faithful, and the products they produce are very good, but having WordPerfect in your corner is like having Evander Holifield fight instead of Leon Spinks. It's nice to have lot's of Leon's, and they are all very nice, but we have needed a real contender for a long time, and we simply do not have one.

No one writes for us. WordPerfect said it best: "It doesn't sell, so why bother with it?" No one of real power in the computer world takes us seriously. Sure, you can import this text and that spreadsheet to the Atari, but why did we always have to do that? Because the programs that were written for the ST were always made to catch up to the rest of the computer world. Atari started fast, but lost the race. The computer is dead.

Take a second to look at what software is currently available and supported on the ST. It's a staggering thought that there is now no commercial word processor, spreadsheet or relational database package originating from and being supported by a US-based company for the Atari.

As for DTP packages, there's only one US-based company still supporting the Atari, and that's Soft-Logik. But, they currently have no plans to update the software for the ST/TT, while new packages and capabilities have been added for Amiga users of the package. In a recent e-mail message passed along by the recipient, here's what Michael Kasmaier from Soft-Logik had to say about the Atari ST/TT on their support BBS:

"To be honest, I never use an Atari anymore. The Atari is so dead now that we don't really use them at the office anymore and rely almost totally on user feedback. I refuse to use them now. Commodore's new AmigaDOS 3.0...is several years ahead of Atari's operating system."

The Atari is dead.

The Atari is still, after seven years, not taken seriously in the computing world and the business world. When you buy a computer, you aren't just buying a bunch of hardware and software. You are buying a way of doing something. Buy a PC and learn how to use Lotus 1-2-3, and you now have a marketable skill that many companies in the country value. Learn to use an Atari spreadsheet, no matter how powerful and user-friendly, and you have no skill that is accepted in the market.

You are no longer as experienced as those with a Mac or PC background, no matter how long you work on an Atari. There is no Microsoft Word, no Aldus Pagemaker, no Lotus 1-2-3, no Microsoft Excel for the Atari. There is no Grolier's Encyclopedia, there is no Carmen San Diego, no MS Works. Walk into B. Dalton Bookseller and see hundreds of Mac and MS-DOS titles on the bookshelves. You will not find ONE Atari title. NOT ONE. Look for Atari in Computer Shopper, BYTE, or any other general computing magazine. Atari is nowhere to be found. B. Dalton and computer publishers know that the Atari is dead.

Adapt or Die

Atari failed to adapt to its niche role as a home computer. Instead, through bumbling and fumbling, the computer went through a series of personality changes from home computer, to business computer, to DTP computer, to MIDI computer, and back to home computer, and now "multimedia" computer. Like a lost dog that never could find its way home, Atari wandered aimlessly for years. Now, it has been picked up by the dog catcher and gassed in the pound. Who let the dog out in the first place? Who cares. Hindsight is 20-20. The dog is dead. Atari is dead.

Atari suffered from a failure to keep its name in the public eye. There is not one user out there, with the possible exception of a Bob Brodie, that will say that Atari has done a good job promoting its product. NOT ONE!

How many YEARS have we been screaming for advertising? How many YEARS have we been pleading for this company to promote its products? How many YEARS have we been saying "Well, next year will be the year of Atari?" When I first read that statement in ST Report, it was 1988. FOUR years ago! No ad campaign, no public relations worth a plug nickel. (Oh, I forgot the Portfolio was in a movie...oooooooh.) What little print ads there have been have been placed in Atari magazines or MIDI/Music publications.

Atari could be selling alien technology out of Star Trek, but no one would pay attention, because no one knows Atari exists. Well, frankly, I have had enough. I don't care if tomorrow is the start of the "Year of Atari." It has become a joke. There will be no "Year of Atari" because the Atari is dead.

How does the company performs on the stock market? Atari stock has hovered around 1-5/8 per share for the better part of three years. It actually went up around $3 a share about the time Atari introduced the TT. But, when investors saw that the TT was actually just an ST with muscles, back it slipped. Hands-on reports from the few people who have a Falcon (i.e., developers) or people who borrow them are indicating the Falcon is "just an ST with more sound and colors." That does not bode well.

Investors long ago realized that the company, and hence the computer, was dead; it is time we do so as well. Why haven't investors started buying Atari, now that the "new generation" has been introduced? Why aren't there ANY institutional investors in Atari? Because investors go by track record. Atari has a track record of a company that is dead. Investors know it; so should we.

I realize this article will make a few of you mad. And it should. Atari is dead. But, don't kill the messenger. Can you really look at your Atari computer and say "This format will be alive and healthy in 5 years?" No, you cannot. Not if you are being honest.

Now, can you look at the IBM PC and compatible market and say "This format will be alive and healthy in five years?" Yes, you can. Same for Macintosh. Perhaps not as robust as they are now, but they will be around.

Atari will not still be around, because Atari is dead. We will still use the darn thing, and since we are so loyal (or just stupid?), we will use them until the circuits have been fried and the monitors are out of focus. But, we should not expect anything exciting to come our way. An occasional program and an upgrade, but nothing worthy of note.

Sure, the Falcon will cause a ruckus for a few months, but it will fade, just like the STACY faded, just like the TT faded, just like MEGA faded, just like the MEGA STE faded. They all faded because ATARI is dead.

Only Atari users will buy new Atari products, because Atari won't do what it takes to market the machines. Recent online conferences with Sam Tramiel and others have shown that Atari somehow expects third-party people to advertise the Falcon for them. Judging from recent fiscal reports from Atari, they may not have enough money left to do the job, anyway.

So, that leaves only current Atari users as the market for the new machines, and our numbers have grown smaller and smaller each year. Try to find a user group with more than 30 members. There are not that many around anymore. Five years ago, there were bunches. Our numbers dwindle because Atari is dead.

Sorry to see you go, old friend, but I won't cry. I have been expecting it for too long, and actually suspected it years ago. I guess I have just been going through denial. But, now I see that you are dead. It is time to bury the corpse. Rest in peace, old friend. Rest in peace.

I Thought Typewriters Were Obsolete!

Robert C. Arp, Jr.

There was a time when my Smith Corona electric typewriter was one of my most treasured assets. I was a young engineer then, trying to enhance my reputation by writing magazine articles for Byte, Radio Electronics, Popular Electronics and even some of the radio amateur magazines, such as CQ.

I vividly remember my last contribution to Byte, if for no other reason than the editor's request to send a copy of the article on disk or via modem. Say what? I was forced to call the editor to explain, somewhat chagrined, that I possessed neither modem nor personal computer.

The editor, perhaps reluctantly, agreed to "find someone" to type the article into a computer. I believe that this episode, as much as anything else, provided me with the impetus to return to the few existing computer retail stores to find a suitable replacement for the Smith Corona.

Enter the Computer

After several months of searching, rejecting the available IBMs, Apples and Amigas, I had given up and decided to stay with the typewriter. But on the way home one day, I happened to stop at my favorite electronic parts store. There, again by chance, I was introduced to the Atari 1040ST by a friendly salesman who listened to my tale of woe.

The 1040ST, 1ST Word and Word Writer ST begat the MEGA ST4 and 1ST Word Plus. I continued to write, using my new tools, but my interest in articles turned to those supporting the use of Atari computers. In addition, my programming interests turned from mainframes to personal computers.

Exit the Typewriter

After the typewriter had been sitting idle for two years, I gave it away. I had come to believe that the instrument was completely obsolete. I had developed the habit of powering up the computer system for even extremely short letters.

Of course, one reason I have preferred to use the computer is its inherent ability to store copies of correspondence on disk. When typing articles, the ability to include graphics figures prominently in my state of satisfaction.

The one task for which the computer seems much less qualified, but for which the typewriter serves admirably, is filling in preprinted forms; income tax and insurance forms for example. Fortunately, most of these—all, until I recently learned otherwise—permit one to print instead of type.

The Proverbial Brick Wall

About two months ago, I had to acquire and fill in a government agency form having to do with business. Much to my surprise, the most prominent icon on the 5-part (four carbons) form was a very large asterisk beside a note stating that all information must be typed.

A bureaucratic dilemma designed specifically to "make my day." Solution—borrow a typewriter. From whom? All of my friends use computers. I consider it to be one of the signs of my maturity—that is the fact that I've learned to roll with the punches—so, I had to find a way to transform this setback into an advantage, somehow.

Powerful as our computers are, sometimes it pays to lift our eyes above the monitor to notice the calculator, pen and paper, or some other useful implement lurking in the shadows.

Being blessed with three strong, tall, good-looking, cooperative sons has proven to be advantageous over the years. No less so in this case. I called number one son in Sacramento and described the problem to him. After a week of research, he called and gave me the magic words Canon ES23.

Enter the Electronic Typewriter

Number one son did good. This baby has some very impressive features. It is part computer, part printer and part word processor; but it is smaller and less expensive than any of these. The street price is about $186.00.

The Canon ES23 electronic typewriter has multiline correction memory, five page format memory, bold print, underlining, impression control, search/replace, caps lock, word delete, automatic paper feed, automatic carriage return, justification, right margin alignment, centering (three ways), column layout, half backspace, backtrace, express backspace and 10, 12, and 15 characters per inch with appropriately installed optional daisy wheels.

There are nine types of daisy wheels available for $15.00 each, five types of ribbons at $4.50 or $5.50 each, and two types of correction tapes for $4.50 each. I suggest that accessories be ordered from the headquarters address in New York, unless you can verify that there are signs of intelligence at one of the other branch offices. I found no such indication at the Los Angeles branch.

ATY COMPUTER

We have the perfect multisync monitor for your ST, STE, TT, Falcon, Mac and PC. Monitor and switchbox $449

New! 21M Floptical Drive: it reads, writes and formats 720K, 1.44M floppy and 21M floptical disk. Small compact size 5" x 2" x 7.5".

Compare ours to others: our is complete with two SCSI ports, SCSI ID select, SCSI terminator select, 21M floptical disk, ICD Link, DMA cable and high quality metal case with external power supply all for only $569.

We can also fit this drive into your existing hard drive case if there is room for it. Less expensive models are also available. Call us for pricing info.

New arrivals:
MegaTalk Board $259, 16-bit sound sampler $225, Mouse/Joystick autoswitch $39, Stereo speakers $29, IBM 386SX emulator $625, ICD Link Host Adapter $119

Store Hours: M-F 10a.m.-7p.m., Sat 12-6p.m.
Authorized ATARI COMPUTER Dealer and Service Center

The typewriter's major functions are best described as individual items. The most important feature for my use is the ability to store preprinted form information in battery-backed RAM. On the forms I process most often, a 10-character/inch daisy wheel works best. But, one form requires a 12-character/inch wheel, so I've already ordered and received that item. A 10-character/inch Courier wheel was packed with the unit, along with a black, correctable ribbon, a lift-off correction tape and a lithium battery.

16KB RAM

Documents (along with their page format, character pitch and line spacing), phrases and page formats can be stored in memory. The typewriter is AC powered, but memory is battery secured. A portion of memory, 800 bytes, is devoted to correction memory, which contains the last 800 characters typed.

A note about recalling documents for printing. Save the page format for each document in a separate page format file. Then recall that page format just before inserting the page for printing. Do this because a document's page format is not in effect until the document is recalled. This precaution permits you to feed in the page to the correct starting position automatically.

55,000-Word Spelling Checker

The Canon ES23 does not correct spelling errors automatically, but the ES33 does. A 300-word user dictionary is also permitted. The default and maximum size is 3000 bytes. The size of the user dictionary can be decreased, a worthy option because the user dictionary consumes part of the available 16KB RAM.

14 CPS Bidirectional Printing

Unidirectional printing is not speced. (When will manufacturers learn that deliberate omissions are equivalent to lies?) Bidirectional printing can be used when printing stored documents that do not contain underlined text.

16 Character LCD

The liquid crystal display shows characters in a stored document or those being typed and various options in effect. The LCD contrast is adjustable. Although only 16 characters are shown, the key buffer holds 100 characters.

Carbon Copy Mode

There are two impact settings—minimum for onion skin or other thin papers and maximum for all other tasks. An overstrike mode can be activated to correct mistakes when typing multiple copies of a document.

Conclusions

If you're forced to power up the big gun for every piece of correspondence, or if preprinted forms are on your list of chores, you may want to take a look at newer versions of the "obsolete" typewriter. Atari users will feel right at home on something like the Canon ES23 electronic typewriter. By the way, you can keep both hands on the keyboard—there is no mouse.

MacSEE

Ron Hunt

MacSEE is a new program from Reeve Software for reading and writing to Macintosh or Spectre disks on an Atari ST. MacSEE evolved from another program called MacREAD, which has been placed in the public domain by its owner, Compu-Seller West. MacREAD had one purpose -- to allow copying files to an Atari ST disk from a Macintosh HFS volume. MacSEE goes beyond that and is also somewhat easier to use.

As anyone who has used an emulator on any computer can tell you, getting files transferred from one format to another can be a real pain. The problem is compounded by the fact that its usually new emulator users who most need to transfer files. Not only do you have to learn a completely new operating system, but you've also got to figure out how to move files between one system and another. Believe me, it can be confusing.

Translators

It's enough of a problem that Gadgets by Small includes its own translator utility, called Transverter, with the Spectre GCR Macintosh emulator. Transverter is a well written, fairly easy to use program. I've used it quite a bit and I've had very few complaints.

However, the one complaint that I and many others have had is that it can't read from or write to Macintosh HFS disks. Transverter forces you to create and use disks with the older MFS format. Add to that the fact that you need another special utility to create double-sided MFS disks and you can see we have the makings of a fairly good hassle.

MacSEE was created to provide a better, less complicated way to do the job. For the most part, it does this very well. That doesn't mean that it's perfect by any means, as we shall see.

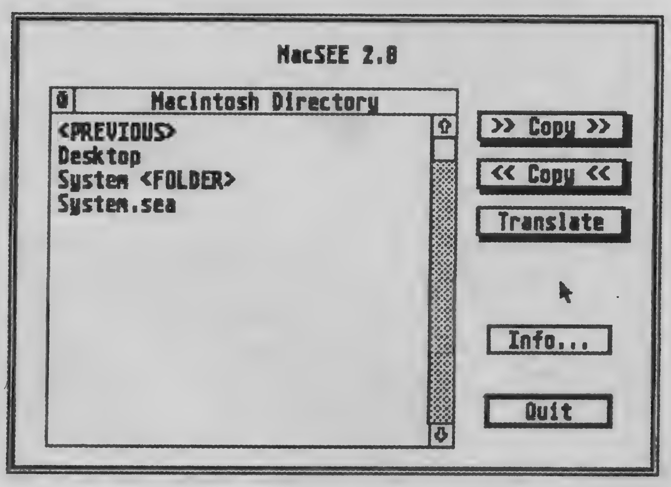
Copy Options

MacSEE can be run from either a floppy drive or copied to your hard drive and run from there. When run, it automatically scans your system for any Macintosh format hard disk partitions. It also looks for partitions created by Spectre and any Mac or Spectre format floppies that might be inserted.

If you're using a 1.44mb floppy drive, MacSEE allows you to read high density Macintosh floppies. If you have a Macintosh or Spectre formatted SyQuest cartridge drive, it will look there, too. As you can see, there are quite a few options open to you for moving files.

The Mechanics

After MacSEE has completed its scan, you are presented with a file selector box showing all of the Macintosh or Spectre format volumes it found. To open a volume, you simply click on its name in the selector. You are then presented with a root directory listing of all the files on that volume. You can navigate through folders in the same way. Just click on the folder name you happen to be interested in, and it opens to display whatever files reside inside.



You can keep moving down through folders until you find just the file you're looking for. If you need to move back up to a previous folder level, all you need to do is click on the <PREVIOUS> entry at the top of the selector window.

If you want to copy a file from your Macintosh formatted disk to an ST disk, just click on the file to be copied to highlight it. Then click on the Translation button and click on the >>Copy>> button. You are then presented with a standard ST file selector box. Choose your destination path and click OK. That's it!

You'll find that MacSEE copies files very quickly. There's no waiting around here. Even the largest files take only a few seconds.

To copy ST files from an ST format disk to a Macintosh volume, you simply navigate to the desired Macintosh subdirectory, click on the Translate button, click on the <<Copy<< button and then select the file from your ST format disk that you wish copied. When you click on OK your file is copied.

There will be some times when you won't want to use the Translate button, which simply toggles MacBinary on and off. Generally, if the file you're copying from your ST has both a resource fork and a data fork (i.e., is a Macintosh file), you will want translation off. When translating Mac EPS files for use in PageStream, you also want to leave translation off. Otherwise, you should leave it on. If, however, you find that a file doesn't copy correctly with Translation turned on, you can toggle it off and try again.

Hands-On

In my testing, MacSEE generally performed as expected. With a couple of exceptions, there were no problems with floppy disk to floppy disk and floppy disk to hard disk transfers. Likewise, floppy to RAMdisk transfers worked fine.

However, it seems MacSEE can't read MFS formatted disks. I know, the whole idea was to be able to get away from having to read MFS. Trouble is, many old-time Spectre users probably have at least a few MFS floppy disks laying around. Also, many of us had special partitions formatted on our hard disks and SyQuest cartridges just to handle MFS transfers. Not being able to handle MFS means many users will need to keep Transverter around for at least a little while longer. It's not a big thing, but it would have been nice if all Macintosh formats had been supported.

Also, it looks as if MacSEE has an upper limit to the size of the file you can transfer. While I don't know the exact size, it's somewhere around 500K. In multiple attempts to transfer some rather large archives, the files would only transfer over once they were broken into smaller archives. Ones that were around 480K seemed to go fine, but ones around 600K gave the error "Not able to add files to extent tree." After trimming a few files out of the oversized archives, they transferred just fine.

SyQuest Troubles

The next problem is a little more serious. It involves the popular SyQuest removeable cartridges. First of all, MacSEE doesn't seem to be able to read cartridges formatted using any version of Spectre prior to 3.0. It wouldn't read several cartridges I had formatted using Spectre version 2.65. It may also have a problem reading regular, fixed (hard) disks formatted using the earlier version, as well. Since I have updated my hard disk to use the newer formatting scheme, I couldn't verify this.

MacSEE had no problem reading Spectre 3.0 formatted cartridges. Likewise, it had no problems reading cartridges formatted on a PLI SyQuest drive connected to a Macintosh IIci. In fact, reading from cartridges seemed to work fine.

Writing to a SyQuest cartridge is another story. On two different occasions, I had the contents of a SyQuest cartridge scrambled while trying to transfer files onto the disk. In one case, I lost about 9mb of graphics files. The manual that comes with MacSEE cautions users to be sure to boot their ST with the SyQuest cartridge they plan to use for transfers in the drive. This I did on both occasions.

In each case, I was only able to transfer a few files to the cartridge before the computer locked with the SyQuest's busy light glowing. After waiting over fifteen minutes on the first occasion, I reluctantly hit the switch to kill the system. After that, the cartridge was unreadable. Actually, I couldn't even mount it on the Macintosh.

I tried using a freshly formatted cartridge with the same results. I could copy files from the cartridge to an ST floppy, hard drive or RAMdisk, but I couldn't copy files to the cartridge. In doing some research into this problem, I discovered that SyQuest drives are very picky about which drivers they are booted with.

Even on the Mac, SyQuest cartridges can get blown away if a previous cart using a different driver was booted in the drive. This is probably at least part of the reason for needing to boot the ST with the cartridge you want to use in the drive. Obviously, though, this doesn't completely solve the problem. At any rate, if you're planning on using MacSEE with SyQuest cartridges, I would advise caution. If you don't use SyQuest drives, you shouldn't have any problems at all.

In conclusion, MacSEE is a useful program for anyone who regularly needs to move files from a Macintosh or Spectre-equipped Atari to standard ST(e)/TT format disks. If used with floppy disks, hard disks or RAMdisks, the user should have no problems. If you wish to use the program with SyQuest cartridges, I would do so with caution. You will need to run your own test with your system to be sure that no incompatibilities exists.

FLASH II

TELECOMMUNICATIONS SOFTWARE FOR ATARI ST, STE & TT

MISSIONWARE SOFTWARE
354 N. Winston Drive
Palatine, IL 60067-4132
phone 708-359-9565…

Flash set the standard for Atari ST Telecommunications. *Flash II* continues to meet and exceed that standard! There is no other telecommunications program available that comes close to the flexibility and ease of use provided by *Flash II*.

What other program includes TTY, Vidtex, VT52, ANSI, VT100, VT101, VT102, VT200, VT300 and Prestel emulations? Or how about ASCII, Xmodem, Ymodem, Ymodem-G, Zmodem, Modem7, WXModem, CIS B, Kermit and SEAlink - built in? Have you ever looked for full ANSI/IBM Graphics? DEC International Character Sets? *Flash II* includes them all!

And don't forget about the 20 macros per board plus another 10 global macros! DO scripts are compatible with Flash 1.6, plus we've added extensions. But that's not all!

Flash II includes an improved Editor/Capture buffer. Text can be blocked with either the mouse, menus, or function keys. Full Cut & Paste, Search & Replace, paragraph reformating, user tab settings and page widths, keyboard cursor control and keystroke substitutes for most menu items are all built in.

Flash II works on any ST, STE or TT, in any medium or high resolution. (It really smokes on a 19" monitor!)

We've included a new Review mode that permits instant review of your online session, including GIF graphics. Statistics are kept for each call you make, keeping track of such items as online costs, upload/download count and cost, etc. *Silent Line* is included for background transfers. Best of all, we've maintained, and expanded upon, the ease of use you've come to expect from Flash!

Flash II Pricing

- Update old versions of Flash for only **$29.95!**
- Full price is only **$49.95!**
- Add $4 S&H ($8 overseas) for all orders.
- Checks (US funds), Visa & Master Card accepted

PageStream 2.2

The Improvements at a Glance

Wayne Padgett

This review of PageStream V2.2 was written to meet Soft-Logik's requirement for the user group package recently received by the Salinas Valley Atari Computer Enthusiasts. This generous show of support to Atari user groups by Soft-Logik deserves the collective thanks of all Atari computer users.

This user group giveaway represents a huge demonstration of trust by Soft-Logik, and I for one hope all of the participating user groups reciprocate in kind by diligently protecting their PageStream user group materials.

PageStream version 2.2 contains many improvements and a few fixes. The changes, according to the manual addendum, number in the thousands. Covering all of the changes in PageStream 2.2 isn't practical, so I'll focus on the high utility changes that are either undocumented or are new in version 2.2. The important fixes will be apparent to all users of 2.1 and need no mention here.

The user group PageStream package is an off-the-shelf retail package, except that it is marked "Not For Resale User Group" and includes a demonstration program disk to allow group members to get a hands-on look at PageStream.

Macros and Draft Mode

Like many, I suspect, I was disappointed with the slow screen redraw and the macro problem with 2.1. The slow screen and the fact that I use macros quite a bit forced me to stay with PageStream 1.8.

Well, the macros work just fine now and Soft-Logik has addressed the slow screen redraw in 2.2 with a draft mode that reduces redraw time by about 31% overall. View level 4, Show Actual Size, was faster with my test page by 145% and view level 1, Show Facing Pages showed nearly no gain at only 4%.

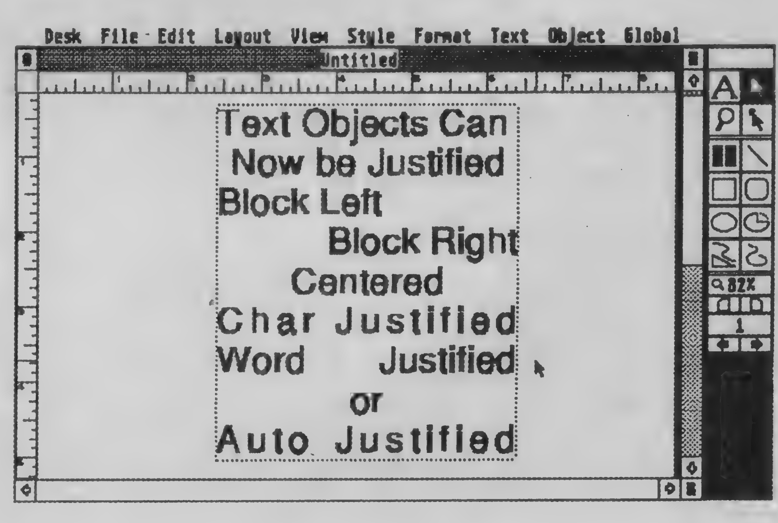
How, you may well ask, did I come up with that number? It was done by timing the period between the instant the next view level was keyed in until the moment the mouse pointer returned to view. The page, which was a good mix of text, IMG pictures and PageStream objects, was cycled through view modes 1 through 7. View 7, User Set Scale, was used twice. The two sets of nine timings were then totaled and compared. The individual redraw times ranged from 2 to 26 seconds in draft and from 4 to 26 seconds in normal mode.

This isn't extensive laboratory testing by any stretch of the imagination, and times will certainly vary with page composition. But, this gives some indication of what you can expect from a stock Atari ST with a monochrome monitor.

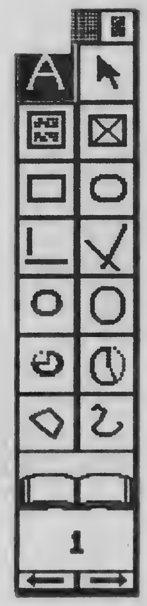
CodeHead's Warp 9 doesn't seem to be a factor in screen redraws other than speeding the appearance of dialog boxes.

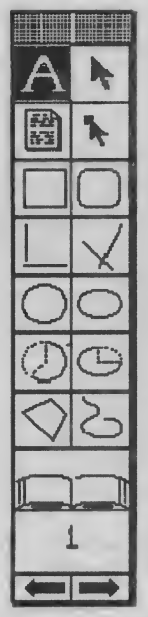
Soft-Logik's 2.2 Manual Addendum's comment on screen redraw makes it sound as though 2.2 should be "significantly" faster on "text rendering" than version 2.1 in normal mode. Timing tests between 2.1 and 2.2 using the same text-only document and the same nine magnification views set produced nine identical times. I even tried sending a block of text from EdHak to a window-size column in each PageStream version. The results were so close that it should be called a tie. While 2.2 was slightly faster, there was no time difference greater than 1.9 seconds! It is entirely possible that larger differences would show up using a 68030 processor or perhaps with Compugraphic fonts in use, but for the stock ST user and PageStream fonts, there is no perceptible gain in screen redraw speed. Faster screen updates are only achieved through the use of draft mode, and these are significantly faster.

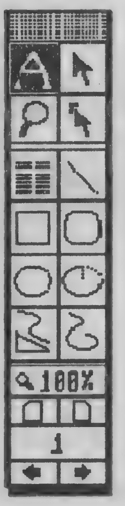
Draft mode can be toggled on and off to get the best of both worlds. Draft on yields



Text Objects Can
Now be Justified
Block Left
Block Right
Centered
Char Justified
Word Justified
or
Auto Justified







speed for composition and off gives a more accurate screen presentation for the finishing touches. The draft mode's radio button is located under View in the Set Greeking dialog box.

New Tool Box

The new Tool Box is, by far, the most visible of all the changes. The Tool Box has been redesigned, and some new tools and capabilities have been added. The keyboard equivalents have also undergone some changes. These are not documented on either the "Quick Reference Card" or in the manual addendum and will be presented here.

The Magnifier tool allows point and click magnification of the work area by clicking at the center of the area to be enlarged. That spot then becomes the center of the screen and the view percentage is doubled with each mouse click (80% becomes 160%, 100% becomes 200%, etc.). Shift clicking reverses the process. The keyboard equivalent for the magnifier is [Esc]-[T]-[M].

The Reshape tool has a new icon and a new keyboard equivalent, [Esc]-[T]-[R]. Its function is unchanged.

The Column, Box, and Rounded box tools now have an added shift function. Drawing with any of these tools while pressing a shift key yields square forms and unshifted drawing allows rectangular shapes. The key equivalents for these tools are the same except for the Round Box tool which is now [Esc]-[T]-[1].

The Line, and XY Line tools have been combined and are simply called the Line tool. Unshifted drawing produces a line of any angle and pressing a shift key while drawing limits the line to horizontal, vertical or 45 degrees. The key command for this option is [Esc]-[T]-[L].

The Circle and Ellipse tools have been combined into the Ellipse tool and carries the new key equivalent [Esc]-[T]-[E]. Drawing with the left mouse button does an ellipse and shift left mouse button limits the shape to a circle.

The circular and elliptical Arc tools have been combined and are now the Arc tool. The new key equivalent is [Esc]-[T]-[A]. Selection of the arc style is made in the same way as the ellipse tool. The left mouse button allows elliptical arcs and shift left mouse button does the circular arcs.

A new icon sets off the "Polygon (Bezier Curve)" tool. This tool now has a shift feature, but it does not select the other drawing option as in the Arc and Ellipse tools. Using shift restricts line direction to vertical, horizontal or 45 degrees. Being able to draw perfectly vertical, horizontal or 45 degree lines with this tool is a real time saver when drawing polygons. Unless you were extremely careful during construction of a polygon with 1.8 or 2.1, you had to go back and work the jaggies out of the vertical and horizontal lines by eyeball and mouse, or the GEM option of selection and movement with the cursor keys. The ability to do perfect horizontal and vertical lines while drawing polygons is much easier. In all other respects, this tool is unchanged.

The View tool displays the current view percentage. Clicking on this icon brings up the Show/Set User Scale dialog box. Shift clicking on the icon will change the current value to the last used "User Scale" value. The keyboard equivalent for this tool is the same as the one for Show/Set User Scale in the View menu.

You have probably noticed that in each tool that has a shift option, the shifted draw mode produces the simpler of the shape options such as squares, circles, circular arcs, vertical, horizontal or 45 degree lines and so forth, while the unshifted option produces the more complex forms. Consistent command use makes it much easier for the user to remember how to select the tool variations.

A very welcome change comes in the entry line for the "Go To Page" dialog box. It now comes up empty rather than defaulting to page 1. No more ending up on page 51 when you wanted page 5.

Dialog Defaults

While we are on dialog defaults, the graphics import dialog now defaults to "Object" rather than "Picture Window." When I began using clip art, it was mostly DEGAS and Neo. Each picture usually contained several drawings, and you had to use the "Picture Window" in order to clip and crop the selected illustration. Most of the graphics I use now are individual IMG format, and since clipping isn't necessary, the "Object" option is used to import the graphic. This avoids another open window, as well as the clip process.

The object Duplicate dialog box now defaults to the last values entered after the first use. This is a big help when you are trying to precisely space several small objects inside a larger one or fit a set number of lines or objects on a page. Instead of having to remember your last entry, it comes up on the next duplication attempt and you can fine tune your numbers for a perfect fit! The XY Entry lines are now labled Horizontal and Vertical making things much easier for math boneheads like me. These changes give even more utility to an already powerful tool!

The "From" and "To" boxes in the print dialog box now default to the numbers of the first and last pages which contain objects. This change first appeared in V2.1 and is not, as far as I can tell, mentioned in the manual or the 2.2 addendum.

This may not mean much to you at first glance but, for me, this is what it does. I sometimes jump to a page well clear of the last page of my document to do layout on a small section. I do this because, with less to redraw, the work can be done faster on a clean page. If I remember to delete the page when I'm finished there is no problem. If I leave anything on that work page without deleting the page and then select "Print All," the program will print my document, print empty pages after the last page of what I want to print and then print my scratch page. This ranks right up there with the hasty punch in of the second page number in the "From To" box and hitting return without checking the numbers. Believing then that you are printing, let's say, from page 1 to page 3, you duck out for a snack and return to discover you've printed the whole document and, as a bonus, the printer has advanced 25 or so blank pages onto the floor. Being able to see at a glance the total pages in a document, including any blank ones, is a welcome change, at least for me!

Changes and Additions

PageStream now imports more text and graphic formats than ever. Several import modules have been improved and there are five new ones. CVG and Arabesque are new graphic modules and the Calamus Text, That's Write and Calligrapher are the new text import modules.

Snap To Grid has been changed in V2.2. Now, as objects are drawn, they snap to the grid, assuming, of course, that Snap To Grid is selected. Formerly, the program waited for you to finish drawing before the object was snapped up.

Text object justification is now recognized and executed in 2.2. This will only have an effect on justified text objects from 2.1 that contain carriage returns and are then opened with 2.2. The solution is to apply justification to the text object by highlighting or selecting it and choosing the justification desired. As with many of the new features in PageStream V2.2, you have to use this one a few times to appreciate the possibilities. For me, text object justification, except for block left, now does automatically what had to be done manually in 2.1.

Arrow gadgets (like in the character and line spacing dialog, for instance) are also mentioned in the addendum. They function once, delay for a moment then advance rapidly. I tried them in 2.2 and they did just that. Then I tried them in 2.1 and they worked the same way. I thought this was just an addendum reminder of a 2.1 feature and deleted my original paragraph on this item.

Meanwhile, I had done all the screen redraw timings on my Moniterm and thought that using an SM124 monochrome might yield some better numbers. I decided to run the timings on my TOS 1.4 equipped 1040 STf monochrome setup. Low and behold, the arrow gadgets ran wild and refused to behave. It was impossible to click to a setting and I had to escape the line to type in the value. My Mega ST also has TOS 1.4 and the arrow gadgets are very docile. Then it dawned on me that I'm running CodeHeads "Button Fix" on the Mega. I copied Button Fix to the 1040 STf system and loaded PageStream to check out my hunch. Voila! Now PageStream's arrow gadgets are well behaved and manageable on my 1040.

Conclusions

Soft-Logik's many improvements have made PageStream 2.2 more powerful than ever before. Many of the less obvious, but very functional, refinements serve to make the user more productive by reducing or simplifying his or her work.

PageStream 2.2 is a good step forward for an already fine production application. If you are using any earlier versions of PageStream, now is a good time to upgrade. Owners of 2.1 can upgrade free via modem or at your dealer, should you be so fortunate as to have one of those. Soft-Logik even offers an upgrade from any other Atari DTP package.

I enjoy using PageStream very much and hope you have picked up something useful from this review. Keep the faith and, by all means, support Atari software developers. They are the future of your Atari computer.

Publisher 2 ST

Sherry Mackiewicz

It came to me in a moment of desperation with a deadline. I had two hours in which to write the entire front page of the WAUG newsletter, print it out using STWriter, make headlines and subheadlines using DEGAS and print those out (since I needed them to be larger than the other text), and then cut it all out, paste it on a template, and pray to all entities that everything fit with just the right amount of white space. I needed a DeskTop Publishing program.

I considered PageStream very briefly. Buying it would be a major expense, and I couldn't justify the cost simply to make the newsletter and to play around with as a toy. Being that I am a cheapskate, Calamus, though wonderful, was also a foregone conclusion. Also, I only have a floppy-based system. While it might be possible, using either of those packages without a hard drive does not look easy. So, I went with Publisher 2 by GST (sold in North America by ABC-Solutions), which sells for around $140.

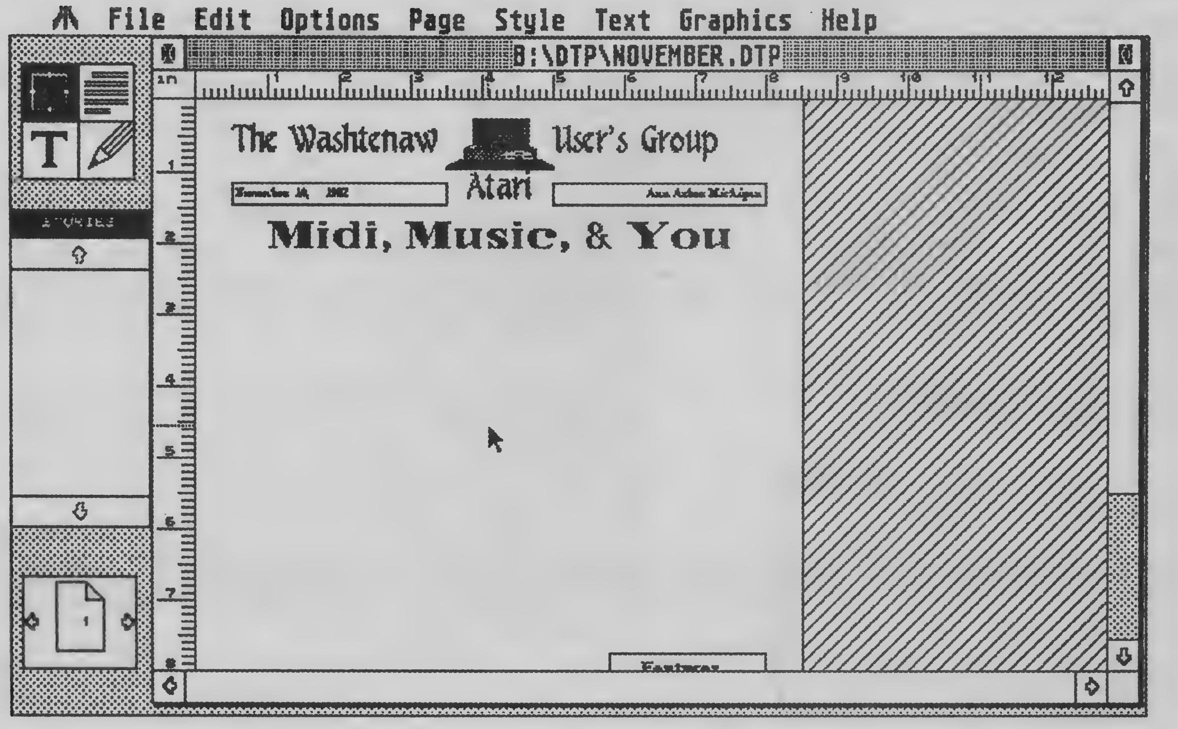
Installation

Installing Publisher 2 was simple enough. The program tells you everything you'll need for your individual set-up (one floppy drive, two floppies, or a hard disk), including how many blank, formatted disks you'll need. The only thing it would not do is format those floppies for you, like some other programs will.

After the installation, you must boot your system with GDOS and then run FONTWID.APP. You do not have to run this program again, unless you change the ASSIGN.SYS file (by adding fonts or you change printers/printer drivers). You do, of course, always have to load with GDOS. The directions warn you not to try to use Publisher 2 with FSM-GDOS, but they say nothing about using it with FontGDOS. I have read that the combination is possible, but after I tried this once and didn't get it to work, I gave up. Altering ASSIGN.SYS files isn't that difficult.

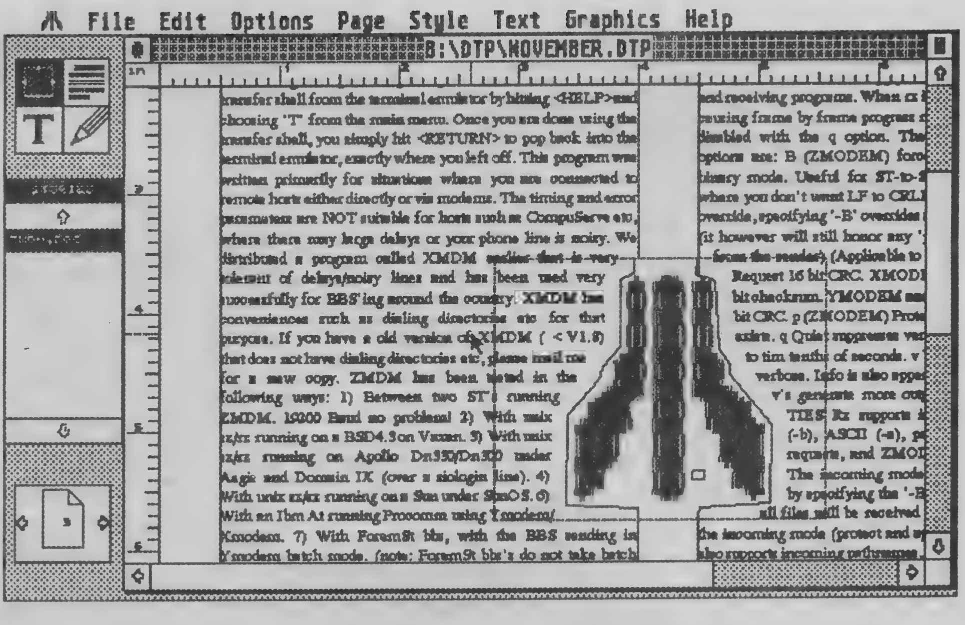
Frame Mode

Once Publisher 2 is loaded, you are automatically put into "frame" mode. Everything you put on a page has to be in a frame. You can define one frame at a time and put whatever belongs therein, or make frames all at



once and fill them in later. You can also move the frames around with the mouse, or by double-clicking on them. Double-clicking on frames gives you the exact positions and widths and lets you enter the correct values. There is an option to not show the frame outlines. This is useful when you have several overlapping (read messy) frames. Also, borders can be put around frames in several styles and weights (thicknesses).

The frame system is more user-friendly than some other programs. You can define as many columns as you wish. You can place pictures anywhere (even overlapping two or more columns), then redefine the frame edges and make text flow irregularly around the graphics. This is a refreshing switch from the last such program I used, in which text would flow only around a square. Publisher 2 allows complete layout freedom.

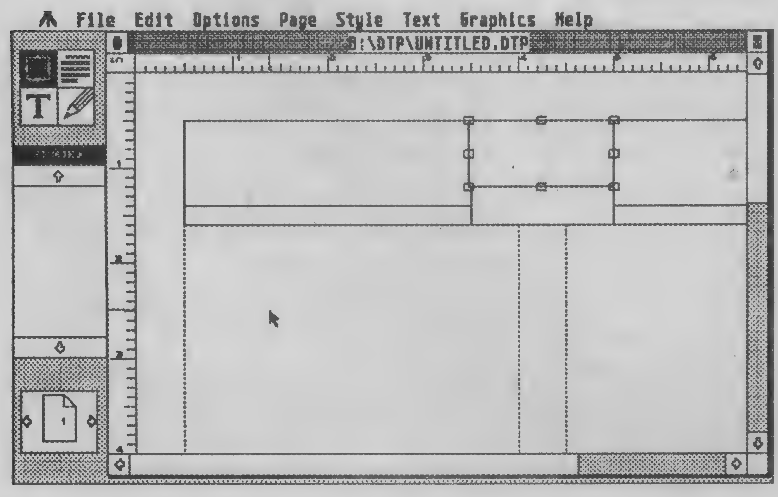


Other Modes

Publisher 2 has three other modes. Paragraph mode is used to set defaults for often-used text formats. For example, if your normal text paragraphs are set in Serif (Times) 12 point, you can set this option (and several others) here. To format an entire paragraph, simply click on it and then click on the style. You can also define your own styles and use function keys for setting them.

In Text mode, you can enter text and change the font and point size for entire blocks (which will override options set in paragraph mode). It is not a good idea to type in a wordy document in text mode, as entering characters frequently causes the screen to redraw completely. Large documents can be imported from most of the popular word processors.

Graphics mode is a bit misleading. You can use this mode to draw line art and pictures or to change existing pictures, but you do not use this mode to import a picture. Importing graphics is done in Frame mode, and graphics can be in DEGAS PI?, IFF, GEM, IMG and many other formats. (Another way to edit a picture is by using the Graphics menu, with choices available for scaling, cropping, and editing.)



Problems?

Now for the bad points. While moving around a document, the scroll bars sometimes "stick." This is taken care of by simply trying again.

Another thing that bothered me was the limitation of point sizes. Publisher 2 will only give you the point size installed in the ASSIGN.SYS file and its double. This is a problem with most GDOS-based packages, as GDOS fonts are not scalable outline fonts (which are supported by the still-yet-to-be-released FSM-GDOS/Speedo).

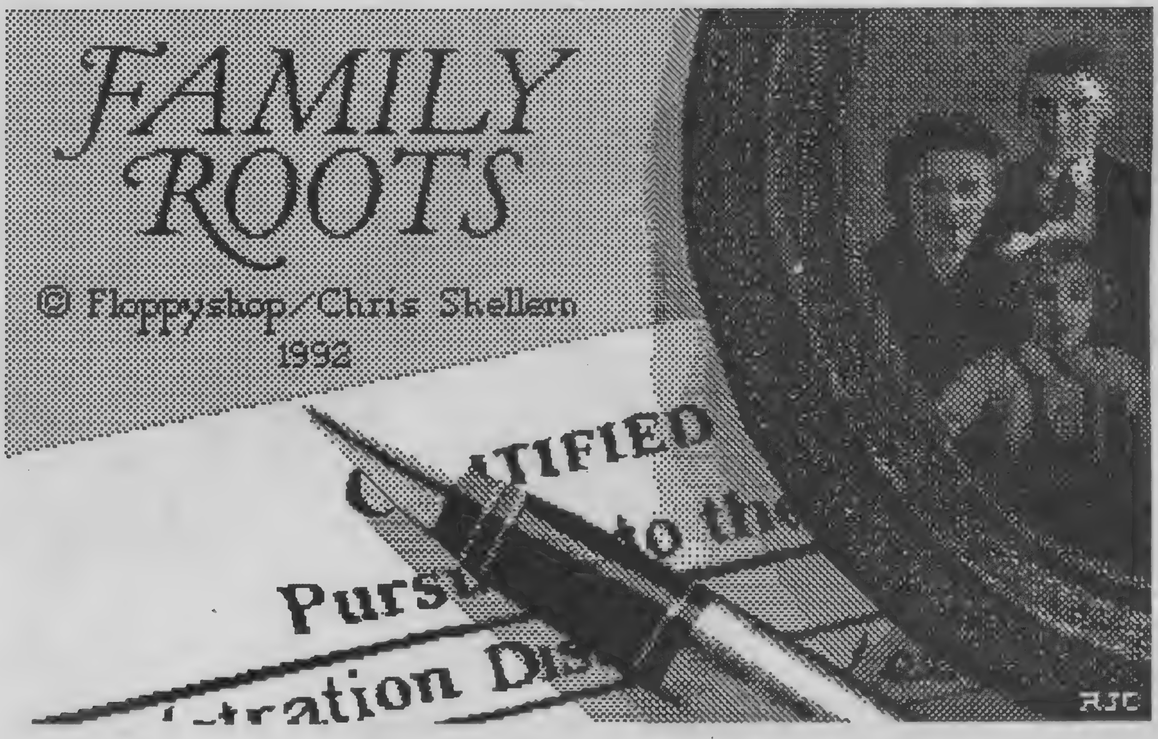
There also seems to be a limit on how many times you can crop a picture, causing problems for small graphics done in DEGAS. If this happens, you don't lose the graphic, but it needs to be reassigned to the frame and all the cropping needs to be redone. Also, DEGAS pictures are only imported in uncompressed format.

In addition, I got a few unexplained bombings during testing. (Just for the sake of completeness, I run Publisher 2 on an STe with 4 Megs of RAM, a Panasonic Multi-sync monitor and a KXP-1080i printer.)

Conclusions

Overall, Publisher 2 is a comprehensive, easy-to-use program. The tutorial included in the manual is very helpful, and extensive help is also available from within the program itself. Publisher 2 uses readily-available GDOS fonts, and you can install as many as you have disk space for (you'll probably have to delete a few of the eight fonts that come with the package). Screen redraws are fast, as is importing of pictures and text. Other handy features are automatic backup, manual kerning, both horizontal and vertical rulers, and style sheets for saving overall formats. To avoid crashes or other problems, the program always prompts for the correct disk to be put back in the drive.

If you only need a very good word processor, it is probably in your best interest to use WordUp or something similar. But if you are doing any documents with graphics or want something a little more professional (not to mention versatile) at a very good price, Publisher 2 is for you.



An ST Geneology Program from the UK

Evelyn Mills

Family Roots for the Atari ST/STE is ideal for anyone interested in recording their Family Tree. It is budget priced and has a database that is limited essentially by memory alone. To record family records, 1 meg of memory will take you back a good few generations -- enough for the most energetic of searchers! The system is easy to use and records can be amended at will.

The program (written in assembly) takes up a minimum amount of memory, is supplied on a single-sided disk and has a useful demo mode which should be run first to familiarize yourself with how the program works. This will save you a great deal of time and get you going within an hour. A well written manual is supplied on disk. There are 10 sections in the manual and any one of these may be printed separately -- a distinct asset for quick reference.

On auto load from drive A, the initial work screen appears. Here, all the demo data can be inspected by scrolling in all directions. An entire family tree can be represented graphically on the work screen, which acts as a sort of virtual grid. Your monitor offers a view to this grid that you can zoom in to or out from.

Note the four small boxes at the bottom righthand corner of the main screen labelled N B G and L S M. Effectively, these boxes act as a mini work bench, giving access to various screens.

Clicking the mouse on M (or pressing M on the keyboard) leads to the Preference/Options screen. This is the controlling work screen for handling text case, text display and simple flag settings to use as markers in relation to the tree. Three definable fields are available to the user. All drive definitions, saving and loading plus screen clearing options are handled here. Leave the AUTOLOAD option ON to ensure that all data will be loaded exactly as saved.

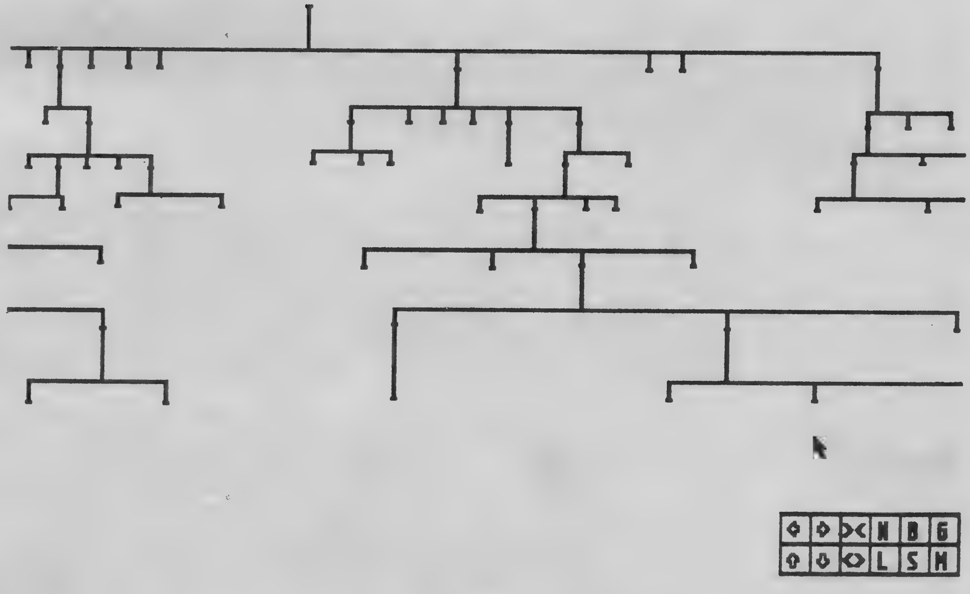
Should detailed information be required at any time, you can press I to access the Family Roots manual from within the program.

Creating Records

The rectangles and design of the tree itself are related to and interactive with the data screen. Pressing or clicking N creates a rectangle which may be sized and placed anywhere on screen with the mouse. Clicking inside this rectangle accesses the database screen. You then type in a surname and press return and that will now be shown in the rectangle. Further information relevant to this person will automatically be entered in the rectangle when entered on the data screen. Pressing or clicking N a second time creates a new rectangle associated with a new record and a new individual.

A complete family tree may be built up in bits and pieces and rearranged in logical order as required. You use the grid option (press or click G) to keep the horizontal boxes aligned. Family Roots is a leisurely program -- you can play around with any part of the family tree irrespective of sequence, and sort or amend the whole thing at a later date.

The block function (press or click B) is essential for printing purposes. You can define a block around any desired rectangle(s) with the mouse. Then, you can click on the PRINTER box, set the parameters and print details of the family tree or part thereof -- different fonts may be imported if required. A graphic called TREE is saved in DEGAS format and text files are saved as ASCII -- these can be tidied up a bit, otherwise a fair yardage of paper will be used in direct printing of tree data!



Cross References

Family Roots' cross referencing ability is excellent. Relationships between relatives are quickly accessed. The search option has its own screen and allows a search of the WHOLE file in memory. Short cuts are also permissible for unknown values. If birth dates are entered as ?/?/184?, ofr instance, a search will be forced between 1840 and 1849. If you've forgotten a name, you can use the wildcard facility to type in, for example, 'd*' and Family Roots searches for all forename entries beginning with D. A more selective way is to type the first three letters. Wildcard searching also applies to town of birth. If you really want to get into a proper search, then use the Identification Code facility.

There is a lot more hidden within this program. You can shrink or enlarge the whole family tree, move the boxes around at leisure, link families together and alter or update information as required. The manual is very clear, the problems are few -- most of the work is associated in tracing your ancestors, as it should be.

Family Roots is available for only £24.95 and comes in a plastic folder to keep postal rates low. It's available from FloppyShop, PO Box 273, Aberdeen, Scotland, AB1 8SJ, UK.

Gadgets by Small Update

Dave Small

February 6, 1993—Hiya, folks. I wanted to let you know "I'm baaaack."

There have been some complaints about Gadgets (and sort of, about me) not being available. I plead guilty, but with extenuating circumstances. I am certainly not as available online or by phone/fax as I was two years ago, and there are reasons.

First off, we're trying to get Spectre 3.1 out the door. I spent time in Oregon last December getting this tuned up (we had DMA troubles with the TT). Spectre 3.1 now understands TT SCSI hard disks and can handle the AHDI/HDX 3 and above "XGM" partition scheme, which was causing users problems. You can convert partitions on SCSI drives to HFS or MFS, just as with ACSI, and no problems. (Working this into XGM cost an extra couple of days, not fun.)

As a lot of you know, 1992 was not much fun for the Smalls in general, not just Gadgets. Ten-year-old Eric was hit by a car and broke his upper leg, which is one of those bones you don't want to break. The bone also tore up his thigh muscles. He had to have a steel rod put into his thigh to hold the multiple pieces together; it took the surgeon an extra hour to line them up. (Gee, that'll be a fun thing to read after dinner.) This happened in May '92. He attended graduation in a 4-legged "walker."

We shut down Gadgets completely over summer 1992. I mean nobody, but nobody, got answered on anything. The reason was we were working with Eric on physical therapy; we didn't want him to have a short or weak leg the rest of his life. My wife begged off on PT; she had been through it twice with knee surgery and knew how much it hurt. So, I got to do it. I also got to sleep around Eric when he'd wake up with muscle spasms, and they hurt quite badly. This went on all summer, and the closest analogy is a new baby in the house that's real fussy—every 2 hours.

It turned out well. Eric calls himself "The Terminator" now and points out that bullets would bounce off his steel leg. (By the time you see this, he probably has had the pin removed, oh joy.) He went back to school in September with no walker, bouncing around, rough-housing with the kids, running up and down the stairs. It is incredible how fast 10-year-olds can heal.

In the meantime, some folks that wanted to get ahold of us were rather peeved. We made up a FAX sheet and sent it out in general (ST-Report quoted it) to our dealers, explaining what had happened. We even scanned in the X-rays of Eric's leg, which are real graphic. (Definitely worse than the start of "Basic Instinct"). And we discovered we were four months behind in FAXes and telecalls and so forth, and our input buffer was getting swamped.

The input is pretty overwhelming. People set autodialers to work on us, so the minute I complete a call and put the receiver down, the phone rings. No hesitation. The FAX volume is just unreal. I'm positive we have lost FAXes in the overall overload.

We've been trying to find some help, and with all the aerospace layoffs in Denver, maybe we will succeed. I've talked with four people so far that did not feel right to me; a telephone person is your whole contact with your customer. You don't want an engineering-type doing it. In the meantime, we answer the phone and ship to dealers when we can, particularly when Sandy is sick of taxes or I'm wasted on Spectre 3.1. (The recent, most embarrassing bug was to find out the hard disk write command was changed into a read accidentally; this is surprisingly hard to discover after the avalanche crash it caused.)

My attitude is that I would rather make X thousand customers happy than one person happy, by NOT answering the phone and wrapping up 3.1, getting it through Beta, and OUT, so TT users can start using SCSI drives. (Spectre 3.1 does not, yet, allow generic SCSI, that is another issue; we are "special-casing" disk I/O.) Spectre 3.1 also has some long-wanted bug fixes, like the MegaSTe with less than 4mb RAM fix and the greater than 4mb fix for TTs. I am having a lot of fun with big memory in general and the MMU. I have to provide a secure ST RAM disk I/O and screen buffer, and the COMBINATIONS are giving me flak. (The TT, for instance, has that big screen monitor which uses up so much more RAM than the STs 32K...I have to allow for it in ST RAM).

Spectre 3.1 is essentially ready for Beta test once I get done wiring up the Mac-required device table stuff. ("Gee, is a hard drive ejectable?") It is headed for Beta test, probably on GEnie to begin with, but that is not a restriction to there. I DEFINITELY want to test out one thing at a time, so I don't get combination errors. Big memory combos in particular have WEIRD bugs. For instance, Mac programs often compress the heap by requesting 8mb of memory. The request fails, but the heap compresses. Well, with a TT and GeSoft board (or with SST), we can actually have 12 megs, so...the request works. WHAM!

The Mac is also "24-bit dirty," meaning it uses the upper 8 bits (like older GFA Basic) for flags. This means an MMU has to watch it to keep from crashing. This is real fun when people are promising to put 68EC030 chips into the ST, where there IS NO MMU, and where I don't know a way to lock all 256 "groups" of 16 meg ST-size pages into one. The manufacturers of these boards say it is no problem to run Spectre; I have absolutely no idea how it could work with 3.1. We have long put out an advisory on this, but it is, shall we say, in the interests of an EC030 board maker to contradict us.

As for patching our code to kill caches, Spectre is real touchy about being patched, on purpose, because of the Dr. Typo dweeb that made a pirate version—and wiped out the boot sector of most machines it ran on. (He was 2 bytes off on a patch, and fell into disk write code with D0 = 0 = absolute sector # = partition sector.) This totally blew away the hard disk for most folk.

So, we know we are too hard to get ahold of. I presently have 130 messages in my email buffer on the Well. That's truly scary, especially with the "bounce percentage" I get of replies that fail. Oh, well. There are hundreds more on GEnie and so forth. But Spectre 3.1 is pretty well done, and it was a lot of work. [We are debating putting in Sparrow...oopps...Falcon support for IDE and Sparrow SCSI, which is TOTALLY different than TT SCSI (beware!), but I'd like a seperate revision for that. The IDE and SpSCSI code seems straightforward.]

I expect that when we finally find the right frontend person (I just hate to call people buffers), things will ease up, and we can all get back to our proper jobs. We did manage to ship a whole bunch of SSTs in the one year its been out, and MegaTalk is out as well. Both of those involved extensive coding and writing of manuals.

I'll let everyone know when Spectre 3.1 is through Beta and solid. I don't want to high-speed timing screw up SCSI drives. Some do it, believe me. We're trying to make the code CPU speed independent, so all those 150 Mhz accelerators will work. (grin)

Okay, back to discussing the real issues of the day: Whether a PC is a better buy than a Falcon—surely the most apples to oranges question I've seen. Oh, yes. We finally whacked through the System 7 thingo that caused so much trouble. But that's news for another time.

Hang in there, folks. At the end of 1992, at midnight, we re-formatted a disk labelled "1992." That is our comment on the whole blasted year. Hopefully, 1993 will be an improvement; nice and dull would be GREAT!

90 Day Money Back Guarantee!

CAD for the rest of us...

$59

tbxCAD

Finally, a CAD package that you don't have to be an engineer to use! (But if you are, have we got a treat for you!) Who needs CAD? Hobbyists, woodworkers, home handymen, decorators, professionals and even engineers. In short, anyone who needs accurate drawings.

Use it for: woodworking projects, garden layouts, model making, floor plans, schematics, flowcharts, technical illustration, blueprints, maps, construction plans, MIDI studio layouts ... the list is endless.

Schematics

Floor Plans

- Infinite drawing plane. Drawing size & complexity limited only by memory.
- Lines, rectangles, polygons, circles, ellipses, arcs, béziers, and fillets
- Accurate location of construction points: tangents, intersections, ends, centers, on entity etc.
- Editing: copy, move, move to layer, delete; rotate and mirror at any angle; scale X,Y or both; and project. Trim or break lines or arcs.
- Dimension length, radius, diameter, and angle.
- Enter labels in any size or orientation
- Choose grid option visible or invisible, snap, spacing.
- 6 line styles and 16 line thicknesses.
- Vector crosshatching
- Variable zoom in, out, default and to full screen
- Up to 254 selectable layers
- User library functions
- Unlimited undo function.
- High resolution printer driver for Epson compatible 9 or 24 pin printers, or METAfile export for other printers or programs (.GEM – GDOS not provided).
- System requirements: ST/STe/TT, double sided drive. ST medium/high or TT medium/high resolutions. 1 Mb recommended.

ABC Solutions

We don't play games.

An unheard-of money back guarantee!

We are so confident that you will find tbxCAD the easiest–to–use CAD program ever, that we make the following guarantee: if for any reason you are unhappy with tbxCAD, return it within 90 days for a full refund! To get your copy, send a check or money order(US funds) to ABC Solutions, or ask your Atari dealer.

Writing a Bulletin Board on the Atari 8-Bit, Part 4

James Bastable (BaPAUG)

Xmodem is a standard protocol used in most communications programs for the uploading and downloading of files, be they text or binary programs. Because the telephone line has a tendency to corrupt data due to 'line noise', such a protocol is essential.

Xmodem is very simple to use and to program into a Bulletin Board. The Xmodem protocol is simplicity itself, although it can never be said to be the fastest way of transferring data.

There are many variations of Xmodem, and all boast different features and different degrees of reliability. I have used Standard Xmodem for over eight years now and can honestly say I have never had a failure that was not detected by the protocol.

Xmodem Blocks

When sending or receiving using Xmodem, the data is split up into blocks of 128 bytes. Each block is transferred one at a time along with three bytes on the front end to signify the start of a block and the number of the block being sent. At the end of a block, a one byte calculated Checksum figure is sent which is used to check the accuracy of the data transferred.

A typical block of data will look like this:

<SOH><BLOCK><255-BLOCK><128 BYTES OF DATA><CHECKSUM>

An SOH (Start of Header) is ASCII character 1 and is always sent at the very beginning of a Block.

BLOCK is the actual number of the Block sent. The first block would have this equal 1, the second would equal 2 and so on. When the BLOCK number reaches 255, the value is wrapped around to 0 and not to a 1 as you might expect.

The third byte (255-BLOCK) is sent to confirm the Block number (BLOCK) previously sent.

Following on from these three bytes, the 128 bytes of actual raw data is sent.

The last byte to be sent is the CHECKSUM, which is calculated by adding together ALL the previous bytes sent and the low byte of this value is calculated as the checksum. This can be expressed as a formula:

CHECKSUM=X-INT(X/256)*256

Where X equals the total of all the previous bytes added together, including the SOH, BLOCK and the 255-BLOCK. As a matter of interest, Atari BASIC can calculate this Checksum far more easily, like this:

CHECKSUM=ASC(CHR$(X))

This places the low byte of X (total bytes added together) into the variable CHECKSUM.

Xmodem Sample

There are many other factors we have to consider when transferring data. The best way to do this is to discuss a sample program line by line and highlight the areas that need expanding. Here I will discuss the various elements of the accompanying program (found at the end of this article). Once again, it is not necessary to type in the program as it only serves as an example.

LINE 70 Sets the values of the variable that are to be used. BLK stores the Block Number being sent. TRY records the amount of attempts that will be made to send a Block before aborting. NAK holds the ASCII value 21 which is used in two ways -- one to indicate that the program is ready to receive data and one to indicate that the Block received was not correct. ACK holds the ASCII value 6 which is used to indicate that the Block received is correct. CAN holds the ASCII value 24 which is used when a transfer is to be aborted.

LINE 80 sets more variables. SOH is set to ASCII 1 which is always sent at the beginning of a Block. CHK is set to 0 and will be used to store the yet to be calculated CHECKSUM value sent at the end of a Block. FLAG is set to NAK and will be used to indicate the condition of the transfer to the program. A$ is DIMensioned to 128, the amount of Data that will be received in any one Block. BUF$ is used to store the correct Data once it has been received.

LINE 90 is the start of the transfer program Loop and will always check the amount of attempts that have been made when transferring a Block of data. Standard Xmodem will always abort if a Block is received or sent more than 10 times. If the Block is incorrectly received more than 10 times, FLAG is set to CAN (ASCII 24). This tells the sending computer that too many attempts have been made and that the line must be so bad that Xmodem transfer is unsuitable at present.

LINE 100 PUTs a byte to the RS232. The first time around, this will be a NAK, which indicates that the program is ready to receive. FLAG was set to NAK in line 80. From now on, FLAG will either contain an ACK if the Block was received correctly or a NAK if not (or CAN if transfer is cancelled).

LINE 110 checks to see whether FLAG was set to CAN. If so, the transfer should be aborted.

LINE 120 gets the first byte of data being sent. This should obviously be an SOH (ASCII 1). CHK is set to the value of the first byte received and FLAG is set to ACK in preparation of receiving the Block correctly.

LINE 130 checks to see whether the byte received is a CAN (24), which tells the program whether the data being sent has been aborted or not by the caller.

I actually check this twice when I program Xmodem for my own use, and a lot of software is adopting this double check. It is possible that line noise over the telephone link could corrupt incoming data to the degree that a byte could be changed to a 24, forcing the program to abort unexpectedly. If you do adopt this method, you should also send CAN twice when actually aborting. In this case, Line 130 would read: IF X=CAN THEN GET #1,X:IF X=CAN THEN REM *ABORTED*

LINE 140 checks to see whether the first byte received was an SOH and if not sets FLAG to a NAK, which tell the program that the data received was corrupt. FLAG will eventually be sent out to indicate if the block was received correctly or not.

LINE 150 GETs the second byte which should contain the block number. This Value is added to CHK.

LINE 160 checks to see whether the value received corresponds to the program's record of the Block being received and sets FLAG accordingly.

LINE 170 GETs the third byte, which

```
10 REM ------------------------------
20 REM -EXAMPLE XMODEM RECEIVE ROUTINE-
30 REM -ASSUMING THAT CHANNEL #1 IS  -
40 REM -OPEN TO RS232 IN CONCURRENT  -
50 REM -MODE.                        -
60 REM ------------------------------
70 BLK=1:TRY=1:NAK=21:ACK=6:CAN=24
80 SOH=1:CHK=0:FLAG=NAK:DIM A$(128),BUF$(1500)
90 IF TRY>10 THEN FLAG=CAN:REM *ABORTED*
100 PUT #1,FLAG
110 IF FLAG=CAN THEN REM *ABORT TRANSFER*
120 GET #1,X:CHK=X:FLAG=ACK
130 IF X=CAN THEN REM *ABORTED*
140 IF X<>SOH THEN FLAG=NAK:REM BAD BLOCK
150 GET #1,X:CHK=CHK+X
160 IF X<>BLK THEN FLAG=NAK:REM BAD BLOCK
170 GET #1,X:CHK=CHK+X
180 IF X<>255-BLK THEN FLAG=NAK:REM BAD BLOCK
190 FOR LP=1 TO 128
200 GET #1,X:A$(LP,LP)=CHR$(X)
210 CHK=CHK+X
220 NEXT LP
230 GET #1,X
240 CHECKSUM=ASC(CHR$(CHK))
250 IF X<>CHK THEN FLAG=NAK:REM BAD CHECKSUM
260 IF FLAG=NAK THEN TRY=TRY+1:GOTO 90
270 BLK=BLK+1:REM ALL WENT WELL
280 BUF$(LEN(BUF$)+1)=A$
290 TRY=1:GOTO 90
```

should contain 255 minus the Block number. This value is also added to CHK.

LINE 180 checks this value and sets FLAG.

LINE 190 is the start of the loop which GETs 128 bytes of data.

LINE 200 GETs the ASCII value of the data and adds it into the string A$.

LINE 210 adds the value to CHK.

LINE 220 ends the loop.

LINE 230 GETs the last byte of the Block. This value should be the calculated Checksum from the sender.

LINE 240 calculates the low byte from CHK and places it in the variable CHECKSUM.

LINE 250 compares the Checksum received with the Checksum calculated from the data received. If these values do not agree, then it is assumed that the data received was corrupt and FLAG is set to NAK.

LINE 260 checks whether FLAG equals a NAK, which would mean that some part of the data received was incorrect. If so, TRY is incremented and the program is forced back to line 90 where another attempt is made to receive the data.

If LINE 270 is reached, the data received must be correct. BLK is incremented, as the program will now attempt the next Block of data.

LINE 280 places the contents of A$ into BUF$ where it is stored for transferring to disk later.

In LINE 290, TRY is set to 1 to start receiving a new data block and the program is forced to line 90 to restart the Xmodem loop.

This program should explain the basics of Xmodem transfer, but it is up to you, the programmer, to check for other errors that may occur.

Data Corruption

The most common data corruption that must be checked for is that of line noise causing a Block to be shorter than it should be. If you were to use the illustrated program as it stands, a short block would cause the program to hang up.

As with any Bulletin Board program, all GET operations must be within a loop which checks (by PEEKing location 747) whether there is any actual data to be gotten. If, after about a minute, your Xmodem program has not received any data, two things should happen. First, the RS232 must be checked to see whether the caller has dropped carrier. Second, if the caller is still there, a NAK must be sent to indicate that a short block has been received.

Another point to watch out for is when line noise causes too many data bytes to be sent. Although this may not cause a problem when a data block is received correctly, it may effect the following data block. To be sure, I always close the RS232 channel to clear the buffer whenever I receive a bad Data Block. That way the next block is not effected by any corruption overspilled from the previous bad block. Any overspill from a previously received correct block (i.e., corrupt data added to the end) should not really cause too much concern.

Other Concerns

Whenever you are transferring data in this way, you must remember to set your RS232 port to NO TRANSLATION by using the XIO command 38. The last thing you want when using Xmodem (or any protocol for that matter) is to have the RS232 altering the data that is being received or transmitted.

One final point that you may, or may not, have thought about is what to do when the amount of data you want to transmit is not divisible exactly by 128. Obviously, the answer is to add extra bytes to the end. The question is what byte value should be added?

I have experimented with many byte values and most seem to cause problems when the file being transmitted is a program (some DOSes object to extra bytes tagged onto a program). In my experience, the safest answer is to check what the value is of the last byte of data to be transmitted and append this value. This method appears to be agreeable to most computer systems, in particular the Atari 8-bit. Another option is to pad the last block with ASCII 26 (Control-Z), which is the standard End of File character.

As I said before, standard Xmodem is reliable for most purposes and certainly when transferring data at speeds of 2400 baud and below. On my Bulletin Board, I have not installed any other file transfer protocol and have not as yet found it necessary to do otherwise. Maybe, this will change when higher speed modems become more widely used, but for the time being Xmodem will do very nicely.

Endings

This concludes my series of articles to assist you with writing a Bulletin Board. I hope some of you will at least attempt it, as I have gained many months of satisfaction from the challenge. The Atari 8-bit is not supported as well as it could be with Bulletin Boards and, I'm sure, more Bulletin Boards for the 8-bit Atari can only do good.

The subjects I have not touched on -- like the message base and menu manipulation -- will have to be programmed by you. I can be contacted via my bulletin board (The City) at 011 (021)353-5486 at speeds of 300, 1200/75, 1200/1200 and 2400/2400 baud (and still using BASIC).

ColorDump 1.03

Robert Ely (JACS)

Over the past two years, our club has been receiving AIM. This isn't the first article any of our members have had published, but it is a first for me. I do write for our newsletter and some of you may have seen my name or handle on the BBS networks or even GEnie.

As a member of a somewhat active Atari user group, I feel it is my duty to do whatever I can to keep the Atari computers alive. I am one of those die-hard 8-bitters. I guess someday I'll move to a bigger machine, but for now, I'm having too much fun with my 130XE. I like to program, and have since 1982, starting first with Atari BASIC, then moving to BASIC XL and finally to BASIC XE (both from OSS, now ICD).

Four-Color Printing

What I am writing about here is one of the programs that I have written and you might enjoy. It is called ColorDump. This is a program to print color pictures on a 24-pin Epson-compatible color printer. This isn't just a color print program; it actually does full four-color mixing. This is the type of printing that makes the color pictures in your local newspaper or magazine. The resolution isn't nearly as good, but the process is similar.

ColrDump v1.03 uses four Graphics 9 images to create a final composite picture. If you are familiar with Jeff Potter's Color View program, you should already understand the concept and basic mechanics of this process. Anyway, ColrDump need four images, while Colrview uses three. The fourth image is a black or gray field image created from the other three images and is used for contrast in the final print. In the technical jargon of the printing world, the black image is used as a "mask."

Colrview uses three light-additive mixing images -- one each of red, green and blue. ColrDump takes these three images and prints them using subtractive color mixing.

Color Theory

Additive color mixing is a process of adding the luminance values of greatly differing hues of the light spectrum. Red is the lowest in the spectrum, green is in the middle and blue is the highest frequency hue. With these three colors, virtually any color between the highest and lowest viewable colors can be created. When equal amounts of luminance energy of each of the three hues is mixed, white light is the result. By varying the total luminance, various shades of grey result. If any of the three hues has a different amount of energy, greater or lesser than the others, a new hue is created. This can be proven through vector math, but is beyond the scope of this article.

Subtractive mixing, on the other hand, works in an opposite but similar way. The resulting color you see is what is left over after an object has absorbed some of the light, To mix colors for a given result, you still need three colors of greatly different frequencies. In this case, they are yellow, cyan and magenta. Mixing all three in equal amounts results in a grayscale opposite to the additive process. A maximum mix results in black and, therefore, all of the light is absorbed.

This was the biggest problem in creating this program. The first version gave me a color picture, but the colors were all off and there was a definite lack of contrast. The contrast problem was a matter of making the dot patterns a little less dense. The color was another story. If it weren't for a book on color TV engineering that my father had, I'd still have the poor color.

A Little History

ColrDump was born out of a program I wrote a few years ago to print normal Graphics 9 pictures on my Panasonic 9-pin dot matrix printer. I wanted a program written in BASIC that could be easily modified to fit whatever purpose I needed. The magazines had programs to print Micropainter pictures, which did a nice job, but they had machine language sub-routines, that, at the time, I didn't understand. I felt this could be done in BASIC, so I got the fever to do it myself.

The first version of ColrDump took me about two weeks to hack out, in a reasonable form, but it was a bit crude. It was written in BASIC XE and used the upper 64K of my 130XE for program space and the lower for variables and the three images..

Latest Update

The color is really nice now, there is plenty of contrast, the menus look nice, and I even got it to work on a stock 64K machine with BASIC XL. Version 1.03 now only loads one line at a time from each image into memory, hence saving mucho space. The speed hasn't suffered, at least not that I noticed.

Version 1.03 now requires the fourth image, mentioned earlier, to print a black image. The fourth image has an extension of .K. If the file doesn't exist when ColrDump is told to print, the program generates the file automagically. It's a good idea to be sure there is at least 8K of disk space before printing, just in case the .K files aren't on the disk. This will, more than likely, be the case, when you first get the ARChived file set. I have included a few of them for readily available RGB file sets, so you can begin printing right away. There is also a full 4096 color file set in the ARChive. [Ed. Note: This program appeared on the November '92 AIM 8-bit Disk of the Month.]

Notes

I used a Star NX-2420 Rainbow printer to test the code. ColrDump uses 16 redefined characters as dot patterns to represent the luminance values in the RGB Colrview images. Be sure your printer is set up to receive the character data. A four-color ribbon is used to print the colors.

ColrDump prints one image color line, switches to the next image and prints the same line for that image. Be aware, this process takes lots of time, but the results are worth the wait. I suggest you start the printing process, then watch a football game or a good movie. The slowness is NOT the program. It actually runs much faster than the printer can do its job. A very fast printer like the NEC P960-XL (a $900+ printer) would probably print the image in about half the time. But hey, what do you want from a $300 printer?

One other note about the program is that it uses six of the seven IOCB channels while printing. If you use Atari DOS 2.x, POKE 1801,6 from BASIC, then go to DOS and rewrite the DOS files (menu item H) to disk. SpartaDOS X users can set this up in the CONFIG.SYS file by typing DEVICE SPARTA ,6. (A sample CONFIG.SYS file is included in the program's release ARChive.) I'm not sure about MyDOS.

ColrDump v1.03 uses the XIO version of the Atari BASIC POINT command to keep data gathering among the four image files at the same place within each file. This should work on all 64K systems regardless of DOS type, as it is part of BASIC XL. It is used as a file pointer offset from the beginning of the file. This allows you to use the files from any disk without any kind of index reference file.

I also made use of the BGET command, which is extremely fast for getting data from the disk. Check out the [V]iew an image option to see what I mean. The image are not kept in memory with this version. If you have a RAMdisk, by all means use it, as this version is very disk intensive! I tried it from both RAMdisk and floppy. There is little speed difference, but the floppy is constantly in use.

Features

Here are the features of ColrDump v 1.03. On the main menu, you have the following functions:

[C]hange filespec
[D]irectory in drive n
[E]xit to BASIC XL
[G]enerate black file
[M]irror normal print
[N]egative print
[P]rint normal
[Q]uit to DOS
[R]everse/neg print
[V]iew an image

Change filespec lets you change the drive number and enter the name of the RGBK files you wish to view and/or print.

Use the directory command to show you a directory of the currently selected disk. Unless you have used SpartaDOS or MyDOS, and have set a working subdirectory with the CD command before entering ColrDump, you will only see the root directory listing.

View an image allows you to display on-screen one of the four pictures in a normal Graphics 9 mode. To return to the main menu, simply press the [Esc] key. You select the image to view by its image print number, as detailed below.

0 = blue image and prints with the yellow ribbon
1 = green image and prints with the red (magenta) ribbon
2 = red image and prints with the blue (cyan) ribbon
3 = black image and prints with the black ribbon

There are a number of print options available. Print Normal pretty much does what you'd expect, and will probably be the way you print most of your pictures. Negative Print prints the picture as a negative. Mirror Print outputs a left-to-right flipped image of the original as a normal, positive picture. Finally, Reverse/Neg. Print prints a left-to-right flipped image as a negative, combining the M and N print funtions.

The other menu options are pretty much self explanatory.

Future Additions

I'm working on v1.04, which will allow four-color printing on either a 9-pin Epson compatible dot matrix printer, a 24-pin monochrome printer or the 24-pin as this version does. The big difference is the 9-pin and 24-pin monochrome versions will print a full image before a color change. This is due to the fact that there aren't many (any that I know of) 4-color 9-pin printers and few 24-pin monochrome printers out there. For the monochrome printers, you will need to buy red, yellow and blue ribbons separately. The program will tell you what to do and will help you to register the colors, ala PrintShop position paper function.

THE POWER USER

M.E. Stefan-Acta

Task Switching with SnapShot

Welcome back to The Power User. Last time, we discussed the safer use of SpartaDOS 3.2d with hard disk systems. This issue, we discuss Tom Hunt's SnapShot.

However, first I must make a special request to all users with the ability to program in assembly language. Tom Hunt is heading an effort with a group of very talented programers to produce an all new DOS. The new DOS (unnamed at this time) will be compatible with SpartaDOS, yet it will include a lot of very advanced features, including a turbo charged batch language, MS-DOS command syntax, very low Memlo, etc.

Tom is currently requesting advanced users/programers with experience in system programing to provide assistance with the effort. Please get in touch with Tom at the Closer To Home BBS (419-368-4413). (Disclaimer: This is an independent effort, not affiliated with ICD in any way.)

Now, without further ado, let's begin this month's discussion. Before I describe SnapShot, I must explain what exactly task switching is. I've seen many Atarians describing multi-tasking and task switching as being the same thing. That's an absurd assumption.

Task switching is the ability to suspend a program (Task 1), place it in the background, run another program (Task 2), do what you have to, and then be able to return to where you left off in the first program (Task 1).

The difference between task switching and multi-tasking is that when you multi-task all programs are running concurrently, while task switching only allows one program to be active at time. The other tasks remain suspended in the background.

SnapShot is a task switching environment very similar to Software Carousel or Back & Forth (for those of you that, like me, had the displeasure of working with MS-DOS compatible computers at some time). I would also like to add that true multi-tasking is not practical, at this point, with the Atari 8-bits (although it is possible).

SnapShot comes in two basic 'flavors'. The HD 'flavor' works with Hard Disk Systems and allows you to have 10 programs suspended in the background at the same time. The M 'flavor' works with Extended Memory (the upper 64K on top of the 130XE or an expanded 800XL) and allows two programs to be active in memory at the same time.

All versions of SnapShot require a minimum of 128K of memory and an XL/XE (sorry, no 400/800 compatibility) in order to work. The HD versions also require a hard disk or a very large RAM disk. All versions use about 1K of conventional memory.

There have been many versions of SnapShot released in the past two or so years. Let's look at the versions.

Memory Versions

The first version we discuss here is 1.1M. This version is important because it works with a utility program called Softboot, which allows you to change "SnapShots" (Tasks) and boot from an all new disk.

For example, you can be running AtariWriter Plus in one SnapShot and Ballblazer in the other. You may even run two different DOSes (Sparta in one, MyDOS in the other) in the two SnapShots. However, you cannot have SpartaDOS in both SnapShots, since version 1.1 only swaps the lower 48K of memory into the upper 64K. Therefore, the overlays SpartaDOS places under the OS will remain intact, and the result will be a death disk. Consider yourself warned!

The next Memory version worth discussing is version 1.5m. This version works perfectly with SpartaDOS and offers the widest range of compatibility with other software of all the Memory versions. Furthermore, most compatibility problems can be cured with a utility program called Rehack13 (Before running the incompatible program, run this utility and you are set).

This is the version I use every day and couldn't live without. I can be running Carina BBS (you need the Rehack13 utility to run Carina II) in one SnapShot, press [Help] or [Control]+[Shift]+[-] and jump to another SnapShot to run Bobterm (for example), and then come back to Carina. However, this version will not run Express Pro.

The most recent version as of this writing is 3.2M. This one is essentially 1.5M, but is compatible with Express Pro. Note that this version will ONLY run in conjunction with Express Pro, and will only work with the Sysop's node. For that reason, Express Sysops must first contact Tom Hunt for information on how to get their customized version. This is one utility that Express Sysops can't do without.

Hard Disk Versions

The Hard Disk versions are somewhat more complicated and more dangerous. If you are not careful using these, you can end up with one messed up partition. For that reason, I must insist that if you use these versions, please set SnapShot up to use its own, exclusive partition (a recommendation that is also insisted upon by Tom Hunt).

All HD versions are also very similar in the way they work. You can have up to ten programs available at the same time residing on your hard disk (or very large RAM disk). For example, a user might have AtariWriter Plus, Bobterm, TextPro, DOS, Turbo Basic, a BBS, etc. all set up and be able to switch from one to another by pressing [Control] +[Shift] +[1], [Control]+[Shift]+[2], [Control]+ [Shift]+[etc].

This is an extremely powerful tool and, as will all the other versions of SnapShot, it can put your Atari XL/XE into an entirely new realm of productivity.

The current hard drive version is 3.0HD, and it works fine with the Black Box, the MIO board and the Multi-Plexer enhancements. Also worth mentioning is that Steve Cardin co-wrote the latest HD version. It is compatible with the same software as version 1.5M and can work in conjunction with the Rehack utility.

In conclusion, if you are not using SnapShot, you are simply not getting the most out of your Atari. It's the perfect use for extended memory, and it provides a great reason for expanding your XL memory. Try it; I promise you will not be disappointed.

I would like to thank Tom Hunt for all of his assistance in preparing this column and for writing what I consider to be the most important piece of software for Atari XL/XE computers since SpartaDOS.

Before we conclude this discussion, I would also like to encourage everyone to register SnapShot with Tom. The suggested donation is $10.00, but the program is worth at least eight times that! It's quite a bargain, wouldn't you agree?
